About the Editor

A tenured associate professor and the Associate Director of the Center for Innovative Media in the School of Media and Public Affairs at George Washington University, Dr. Ker-ric Harvey is also a working playwright and multimedia producer who explores intercultural conflict in a wide variety of periods and places, including real-world, online, and social media landscapes. She also writes about the media arts and cultural archetypes in the public imagination, the anthropological effects of new media technologies, digital storytelling, and the relationship between new media narratives and political identity.

In 1995 she was appointed as one of 33 participants who constituted a National Science Foundation task force charged by the Clinton White House with setting a 21st-century national research agenda for Internet issues from the anthropological perspective. Her research and policy development work during the formative stages of the Internet era continued with a two-year stint on the Smithsonian Institution's Curriculum Initiative Program National Advisory Board.

Her work in new technologies and society continues through her appointment as a 2012 visiting scholar at the University of Oxford's Bodleian Library, by a host of publications ranging from

books to juried academic articles, and by her many international academic presentations including recent talks at the Oxford Internet Institute and at the British Museum.

An award-winning teacher, she has been on the George Washington University faculty for just over 20 years. Harvey worked as a reporter in Native American print journalism; in research, script development, and production for educational film; in production and operations in public access television; and with the International Documentary unit of the Seattle public television affiliate station. Harvey balances her academic career with international theater, multimedia, and documentary productions in both physical and virtual spaces. She has had her original dramatic work produced professionally in Scotland; Ireland; New York; Pennsylvania; Vancouver, Canada; and Washington, D.C.; as well as having original radio drama aired on Canadian public radio in Halifax, Nova Scotia, and on RTE-One, Ireland's premiere public radio station, which broadcast her 2001 *Driving in Ireland* as a Play of the Week. She is a member of the University Film and Video Association, the Irish Film Institute, and the Dramatists Guild of America, as well as a Fellow of the Royal Anthropological Institute.

Introduction

“Politics,” it has been said, “is a practical art.” In the early years of the 21st century, it is also a technological one. The explosion of “social media” into the American political process began with the Internet’s entrance on the voting scene around 2004, when Facebook debuted on American campuses as a kind of “cruising and schmoozing” network, and Howard Dean ramped up his earlier success at Internet fund-raising to a fever pitch. Now, in late 2013, social media of many types are exploding across the political landscape, with unforeseen and, to some extent, still unknown eventual effects. Their impact on the political process has eclipsed even that of the Internet, if one measures in terms of the sheer volume of messaging they carry, and they have achieved this prominence in a much shorter time than the 30 years it took the Internet itself to rise to its current status as a taken-for-granted tool in mainstream politics.

Electronic voting, Internet campaigning, proliferating political use of tweeting and texting, blogging and vlogging, online polling and Facebook “friends” all hawking their favorite candidate, issue, or policy point: For better and for worse, electronica has infiltrated the American political process in a way that, some argue, actually re-shapes it. This is the case despite three bedrock realities about the political use of social media, which are that (1) it gets more sophisticated, nuanced, and potentially invasive almost constantly; (2) it is

increasingly ubiquitous; and (3) we do not know nearly as much about it as we would like.

But in the short time since the Internet opened to commercial exploitation, the modifier *industrialized* itself has lessened in relevance as a useful criterion for sorting nation-states into their traditional First, Second, and Third World categories. This taxonomy depends, increasingly, on what I call a nation’s relative degree of “informationalization” instead—the ability to collect, generate, store, transmit, interpret, share, and/or hoard data per se. A second important signature trait, as a signifier of First World status, is the capability to build, acquire, maintain, and deploy the technology that is required to manage, mine, and maximize information, including but not limited to “Big Data” sets. In the era of “Big Data” and the information industries, it makes much more sense to divide the world into “informationalized,” “emerging,” “hybrid industrial/informational societies,” and “noninformationalized” sectors instead of relying exclusively on the old standards related to manufacturing and industrialization. The changes implicit in this paradigm shift are indicative of just how profound a societal transformation has resulted from the combined effects of social media and contiguous digital, mobile, and online technologies.

This new way of thinking about “data” as a harvestable crop has profound implications for all aspects of collective life, even if they are not the

implications one might expect or predict. It could be argued that the most significant anthropological paradigm shift of the late 20th and early 21st centuries is the changing relationship between human beings and the electronic devices designed to serve them. This is especially true of communications and media electronica, beginning with the Internet's transition to a public entity in 1996 and continuing through to the near ubiquitous presence of today's mobile personal communications like cell phones, BlackBerries, and tablets, and the social media they both spawn and support. New media pioneer Nicholas Negroponte, famous as one of the founding members of MIT's 1980s Media Lab, captured the enormity of this paradigm shift when he wrote: "Computers are not about computing any more. They are about life."

In much the same way, "personal" media are not about personal life any more. They are about the tensions between cultural, social, and economic change and stability, stretching all the way from the small crises and triumphs of suburban households to the mammoth ambitions of collective governance. They are about people and institutions connecting with each other in virtual ways, with the side effect of dodging each other in the flesh. They are about reinventing the workplace, redefining journalism, revolutionizing commerce, education, medicine, and consumer identity. They challenge conventional ways of teaching, learning, parenting, dating, filing taxes, staying well, planning travel, finding a plumber, understanding the world, governing the country. They have changed, and continue to change, the practice, the process, the philosophy, and perhaps the very nature of politics. This encyclopedia is an attempt to capture, describe, and contextualize the elusive leading edge of this phenomenon, which has already demonstrated its ability to generate very concrete effects on 21st century self-governance. Some of the challenges it faces in achieving that goal reflect the unique nature of the social media themselves.

Defining "Social Media" in the Political Sphere

Defining the "social media" is not nearly as cut-and-dried as may first appear, and depends, in part, on cultural geography. Europeans approach several of these issues very differently than do North Americans, and even within this continent alone,

regional distinctions can complicate any simple answer. "True" social media success depends on who and how many people retrieve what one sends out, not on pre-identifying at whom one aims a particular message. "Aims" in the technical, not the functional, sense of that word: Twitter users may not actually address their messages to specific receivers, but they do go to enormous lengths and great pains to craft the kind of regular tweet stream content and Twitter profile that will draw the attention of the kind of person they want to reach. In this way, some of the social media replicate the audience attraction model employed by broadcast television and radio, while they actually invert the "known caller" principle of person-to-person technologies like the telephone.

Once we start digging, it becomes easy to see why there is a lot of debate about what actually constitutes the social media. Does e-mail count? How about reposting modalities, which do not add anything new to the actual content but which enjoy an aura of personal endorsement by the simple fact that someone found it worthy of sending forward to his or her followers? How about sites like Reddit, that connect candidates and voters in a kind of large-scale electronic conversation? Or Tumblr, or Pinterest, and other similar "pastiche platforms," which can provide a highly textured portrait of a public figure's preferences in music, art, theater, food, literature, current fads and fashions, as well as his or her informal commentary on assorted political topics of the day? What about YouTube? Texting? Even blogging, a new media format that has already seen heavy action as a vehicle for political expression, exploration, and opinion-sharing?

Signature Traits of the Social Media

Given the challenges involved with defining social media according to their technical design and/or functionality, it might be useful to approach the question from the other direction, and to describe the social media in terms of their characteristics as experienced by users within the new media mix, especially as those user impressions might relate to political activity. I would like to suggest that social media, per se, exhibit the following specific characteristics, in varying degrees and with different applications, depending on the use context in which they are situated.

- Social media are technologically organized as one-to-many transmissions but are experienced as one-to-one, peer-to-peer communications.
- Social media feel personal, even if they are not.
- Social media proliferate organically according to their salience for social network users and their perceived relevance to topics of the day.
- Social media proliferation can also be the result of institutional (and sometime individual) manipulation via the use of social media optimization tools, search engine optimization strategies, and wikis.
- Social media messages are short, to the point, usually personal, and often extremist.
- Social media encourage a communication context in which the usual rules do not apply.
- Social media appear to level the political playing field, even if they do not.
- Social media content travels.
- Social media create a sense of community.
- Social media are instantaneous, and thus seemingly spontaneous, expressions of belief, opinion, observation or experience.
- Social media are fun.
- Social media can be dangerous.

Social Media and Candidate Politics: Game-Changers and Go-Getters

In the days when the Internet was a fairly recent post-Advanced Research Projects Agency (ARPA) phenomenon, the idea of using it for any type of buying or selling was faintly heretical; it was perceived as a way for scholars and researchers to collaborate across time and space rather than as any sort of “public highway” or shared social space. Only during the halcyon days following the passage of the Telecommunications Act of 1996, which in its own right represented a radical reversal of the notion of telecommunications, *per se*, as a public resource more than a private enterprise, did the privatization of the Internet and its companion activities really take off.

In the online land rush that followed, spectrum space and technical resources were obtained and positioned by private interests such as cell phone service providers and the emerging personal

computer industries, opening the door to the barrage of social media inventions and applications that followed.

Turning points in this journey include 1991, when the Internet expanded into the World Wide Web as a free public resource; the 1992 Clinton-Gore and the 1996 Bob Dole campaigns’ use of the Internet as voter outreach tools; the 1999 decision by the Federal Elections Commission enabling online credit card donations to qualify for federal matching funds; John McCain’s and Howard Dean’s early successes at online fund-raising in 2000 and 2003 to 2004, respectively; Barack Obama’s now-legendary 2008 and his more recent 2012 presidential victories, both watershed events for using social media as ways to enhance—and in some cases, reinvent—virtually every aspect of running for office; and the crucial role played by social media in establishing the Tea Party, as it morphed from a loosely connected group of disaffected voters into a serious political entity capable of challenging the Republican Party for the loyalty of a coalition of unhappy conservative voters, as well as some disaffected “independents” and a smattering of restless Democrats.

The 2012 race for the White House saw social media grandmaster Barack Obama and Republican challenger Mitt Romney both capitalizing on every type of social media outlet, channel, venue, and platform available, from Pinterest to YouTube to brand new virtual campaign applications that gave them access to the full spectrum of voters’ online behaviors and preferences, allowing political strategists to microtarget potential supporters with the same efficiency—and privacy intrusion—as, say, commercial interests such as Amazon.com or Walmart.

Measuring Social Media Political Impact

A unique and ubiquitous aspect of the social media/politics relationship is the degree to which theory is vastly outstripped by practice. There is not complete academic consensus about social media’s impact in the political sphere and the best ways of measuring it—but by the time this encyclopedia hits the bookshelves (or the spectrum), there might be. Trying to get a clear look at social media’s “real” impact on the sociocultural infrastructure is like trying to nail down water—as impossible to achieve as it is frustrating

to attempt. And yet, attempt it we must, if for no other reason than to get traction on its palpable effect on the permanent gears of social machinery—like voting, for instance. We must find ways to see it clearly, even if the ability to capture it in accurate numbers and meaningful measurements might elude us. Although it is a natural candidate for ethnography, quantitative material about the social media is more highly prized because it is the most immediately useful for those who study and who deploy them in the political arena, for the simple reason that the stakes involved in social media political deployment always come bundled in quantitative form, like what something costs in terms of dollars and what it might yield in the number of added votes it might garner.

On a slightly different note, the modern-day Tea Party, a splinter group within the Republican Party which erupted onto the national political landscape in 2008 and moved into mainstream status with the 2010 midterm election, relied very heavily on Twitter, Facebook, and related social media as they deliberately distanced themselves from traditional conservatives and formed their own political agenda and developed the party organization to promote it effectively.

Measuring social media's political impact, then, is clearly just as much of an art as it may be a science, whether that "measurement" comes couched as actual numbers, or is assessed in terms of the likely result of specific political dynamics in which the social media may have figured. Pursuing and refining accurate and usable social media measurement techniques will no doubt rank high on the "to-do list" of political managers and activists in the days, and in the elections, and in the public debates yet to come.

Contemporary Issues: Social Media in a Political Context

In light of everything we have discussed about the mercurial and elusive nature of the social media throughout this essay, it seems fitting to frame the issues surrounding their current incarnation as points of salient inquiry rather than as statements of permanent fact. If there is one constant attribute shared by all of them, it is the penchant for change, a feature that suggests the issues surrounding their deployment in the political atmosphere will change as well. A "good answer" is only valid

as long as the context surrounding it remains stable, but a "good question," to paraphrase the tagline of the diamond industry, is forever.

This, then, is a kind of "20 questions" laundry list of some main questions and concerns, debates and discussions about the political role, nature, impact, and future of social media in the current American political environment:

1. Do the social media really level the political playing field?
2. Do social media favor incumbents or challengers? How does this play out in particularly close elections?
3. Will the social media replace, augment, or operate independently of traditional media in the political process?
4. How do we know which of the social media are a passing fad and which are here to stay?
5. Will the social media literally transform the political process?
6. What demographics most accurately characterize different social media constituencies, and to what degree do these correspond to conventional political constituencies?
7. How can social media impact be measured in the political arena?
8. Do people actually trust social media as a source of political information?
9. To what degree, if any, will social media replace face-to-face political discourse, dialogue, and action?
10. What privacy issues are involved with the harvesting and mining of personal information when using social media for campaigns or in social issues initiatives?
11. How do the social media compare with legacy media in affecting public opinion?
12. Whose voice(s) dominate the social media landscape, why is that so, and what does it mean?
13. Are the social media capable of actually creating new political relationships and attitudes, or do they merely reinforce and/or reconfigure existing ones?
14. Do the social media contribute to political polarization?
15. Do different types of people respond to and/or use, create, and deploy social media

- political content in different ways and for different purposes?
16. Do the social media really empower grassroots organizations and political entities, and, if so, what are the most effective strategies for capitalizing on that?
 17. What codes of best practices should and/or could be developed for social media campaigning, outreach, and voter education, and who should be liable when breaches occur?
 18. How are the social media changing the fund-raising process in political action and candidate politics?
 19. Do the social media make possible some forms of political action, expression, organization and public influence that simply could not otherwise exist?
 20. Is that a good thing across the board, or should the social media be somehow licensed and/or regulated, as was the case with earlier forms of electronic media, and, if so, who should do this?

Looking Forward

In October 2012, the much-respected Pew Research Center's Internet and American Life Project reported that 60 percent of adult Americans use at least one type of social media, and that of that 60 percent, approximately 66 percent have widened their everyday use to include political activity, ranging from low-investment action like using social media as a platform for sharing their own political opinions and listening to others, all the way to forming groups and organizations that take civic action in the physical world, an expression of the kind of deep commitment to political matters that was debated so hotly in the Malcolm Gladwell–Clay Shirky discussions.

These statistics about increased public use of social media as a political resource become even more significant when they are contextualized within the escalating use of social media, in general. Social media alpha-blogger Cara Pring noted in February 2012 that "Social networking is still the fastest-growing active social media behavior online," an observation made politically important by the Pew Internet and American Life (2012) finding that "35 percent of social media users have the tools to encourage [other] people

to vote . . . and 34 percent [of social media users] have used the tools to post their own thoughts or comments on political and social issues."

"Smart phone users now spend as much time using social networking apps such as Twitter and Facebook as they do playing games," Pring also reports, a use change that will factor heavily in upcoming American politics if another social media expert, Tomi Ahonen, is right in his prediction about the mobile industry becoming the dominant player on the global scene.

At first glance this seems like an extreme and somewhat exaggerated bit of technological crystal ball gazing, until one realizes the base numbers from which Ahonen's prediction is made. Almost 6 billion active mobile phone accounts already exist worldwide, although once they are parsed for people with more than one account, that figure reduces to something like 4 billion unique mobile phone users, still a stunning number when one considers that the world's 2013 population is only around 7 billion. As has been the case historically, the world's population keeps increasing, but what is new on the historical scene is that the proportion of that population that is hooked to social media keeps increasing as well.

Social media's continuing trajectory into the heart of American politics is not just about mobile telephony. A November 2012 Pew report revealed that "55 percent of registered voters have watched political videos online this election season, and 52 percent have had others recommend political videos for them to watch online" (November 2, 2012), and that around 10 percent of people who donated money to the 2012 presidential candidates did so via a text message or cell phone "app."

The people who run campaigns are not waiting for the academy to make up its mind about the efficacy of social media in getting their candidates into office. They are just going out there and doing it, and they are doing it at warp speed. Certainly, they dial into academic research on the topic, and often commission their own studies on preferred ways and means, but they are willing to leap into a kind of raging torrent of best guesses about the best practices for using the social media to win political contests at all levels of governance. And that means that this encyclopedia and other reference works like it are best understood

as compasses rather than as maps in the social media journey.

Inspired by *CQ Researcher* (www.cqresearcher.com), another product in the SAGE family of publications, we even undertook our own research for the table of 2013 Congressional Social Media Use. The table, which contains material that is unavailable anywhere else because we actually generated it, illustrates the particulars of how our national leaders use different types of social media as part of their work on Capitol Hill.

In 1995, I had the very great honor and the singular experience of being part of a National Science Foundation Task Force convened by the Clinton White House. We were handed the Herculean task of developing an anthropological research agenda on Internet issues for the next 100 years. That was our mandate, almost verbatim, and we took it very seriously, especially since we only had three days in which to do it. After being locked in the basement of the St. James, a Washington “grand dame,” we eventually consumed enough coffee and donuts to come up with an agenda for, at least, kicking off that mammoth undertaking. (There is, of course, both a federal report and a scholarly publication attesting to this.) But we thought the tidal wave of cultural change we saw coming was all about the Internet, and that was engulfing enough. No one had a clue that something even more totalizing was just around the virtual corner . . . and not a one of us would have predicted how very quickly that technological torrent would froth over into all aspects of American life.

In the course of my own research on new technology, culture, and the political process, it has recently come to my attention that the U.S. Library of Congress now archives Twitter. The rationale behind this is that Twitter represents a one-of-a-kind cultural resource. The library press release announcing the project explained the thinking behind this seemingly quixotic decision:

“The Twitter digital archive has extraordinary potential for research into our contemporary way of life,” said Librarian of Congress James H. Billington. “This information provides detailed evidence about how technology based social networks form and evolve over time. The collection also documents a remarkable range of social trends.”

Every public tweet since Twitter’s launch in March 2006 has been carefully preserved in a digital

collection now numbering in the billions, which is not surprising since, according to TechCrunch, in 2013 “we see a billion tweets every 2.5 days.” In acquiring the entire public Twitter record since the medium’s inception, the library has in one bold stroke rewritten the seriousness with which residents of today’s digital era will perceive this most notoriously trivial social media modality.

Of course, Twitter was moving toward acquiring an impressive amount of political gravitas anyway, as it became more and more of a central presence in sequential rounds of national elections. But to have a world-class institution like the Library of Congress acclaim a medium named after “inconsequential chatter” as a “unique record of our time,” as Bill Lefurgy, the library’s digital initiatives program manager, told the Federal News Radio Network, sends a signal that is cultural as much as it is political.

The message is simple, and stunning, and it pushes social media per se into a new class of cultural significance from which it will now never retreat. The message is this: Even the most light-footed of today’s social media modalities carries enough political clout and contains enough social and cultural value to take its place in the American archive of record, a public resource of global as well as national excellence, which has at its core the personal library of U.S. political icon and former president Thomas Jefferson. Because it is Jefferson’s own collection that formed the nucleus of the Library of Congress, when he willed his beloved cache of personal books to the fledgling nation as a lasting legacy. And now that cache will share digital shelf space with Twitter.

One cannot help but wonder what Thomas Jefferson would have to say about that. Could he express it adequately in only 140 characters? But it is still a good question, the kind of question that might elicit brief enough answers that they could eventually find their way into the American Twitter archive at the Library of Congress. Even better yet, the question itself might be provocative enough, intriguing enough, quixotic enough, and most of all, short enough . . . to go viral.

And what, I wonder, would Thomas Jefferson make of that?

Kerric Harvey
Editor

Chronology

1945: In his essay “As We May Think,” published in the *Atlantic Monthly*, Vannevar Bush argues for creation of a collective memory, which he called the memex, to facilitate and augment the powers of human thought by storing and organizing information; this essay is often cited as the first to suggest the properties later realized through hypertext.

1946: AT&T establishes the first mobile telephone network, making mobile telephone calls possible, although the equipment required was so cumbersome that it was only practical if installed in a vehicle (a truck driver placed the first mobile phone call on June 17, 1946).

1962: J. C. R. Licklider articulates the basic concepts behind the Internet in a memo in which he discusses the possibilities of what he calls the “Intergalactic Computer Network.”

1965: AT&T launches an improved mobile phone system, transmitting signals over radio channels. Demand for the service far exceeds the capacity of the channels to carry signals.

1967: Jef Raskin coins the term *QuickDraw* in his Penn State University doctoral thesis on the GUI (graphical user interface).

1969: The ARPANET, a forerunner of the Internet, transmits a message from computers at Bolt Beranek Newman in Massachusetts to computers at Stanford University and the University of California, Los Angeles (UCLA), in California.

1969: CompuServe becomes the first major commercial Internet service provider in the United States, using dial-up technology; it remains a dominant player in the field through the 1980s.

1971: Ray Tomlinson develops the first network e-mail program, and specifies the “@” symbol to indicate the Web address.

1972: Two information services, Dialog (Lockheed) and the Don Jones-Bunker Ramos News Retrieval Service, go online.

1973: The ARPANET establishes connections with computers in the United Kingdom and Norway.

1973: Motorola produces a prototype handheld mobile phone; previous mobile systems were so large they had to be used in vehicles.

1973: The Xerox Alto, a computer intended for personal use, is developed at the Xerox Palo Alto Research Center; among its innovations are the

graphical user interface (GUI) and the computer mouse.

1974: The first chat room is created at the University of Illinois by Doug Brown and David Roolley.

1974: In a conference paper, Vinton Cerf and Robert Kuhn become the first to use the term *Internet*.

1974: Theodore George Paraskevakos, a Greek immigrant to the United States, is granted a patent for an “apparatus for generating and transmitting digital information,” laying the groundwork for the smartphone.

1976: Before there was even an Internet, Queen Elizabeth II of Britain sent her first e-mail as part of a network technology demonstration put on by the British military and research community. It was sent over ARPANET. She is reputedly the first head of state to use the medium.

1976: Presidential hopeful Jimmy Carter and his potential vice president, Walter Mondale, use e-mail to coordinate campaign event planning.

1978: The Advanced Mobile Phone System, an analog cellular system, is introduced in the United States.

1978: In February, Ward Christensen and Randy Suess create the first public bulletin board system (BBS), allowing users to make online postings.

1978: The first virtual world, Multi-User Dungeon (MUD1), is created at Essex University in the United Kingdom.

1979: In Tokyo, Japan, the first commercial automated cell telephone network begins operation.

1980: The Usenet begins operation; it allows users to post messages to online newsgroups organized around different topics.

1981: The IBM PC (personal computer) is introduced.

1983: The domain name system (DNS) is developed at the University of Wisconsin, including

the use of familiar extensions such as .com, .org, .edu, and .mil.

1983: The DynaTAC mobile phone, created by Ameritech, becomes available in the United States. The first world’s first commercial portable handset cell phone, the device was developed by the now-defunct Ameritech and sold by Motorola for \$3,995 per phone.

1983: The ARPANET divides into two networks: MILNET (to serve military purposes) and ARPANET (to serve research purposes).

1984: The AT&T Bell telephone system, a government sanctioned monopoly since 1913, is broken up into seven regional holding companies (Baby Bells), in accordance with the 1982 U.S. District Court decision in the antitrust case *United States v. AT&T*.

1984: The Prodigy online service begins operation; by 1990 it becomes the second-largest U.S. Internet service provider, second only to CompuServe.

1985: Quantum Computer Services launches Q-Link, an online service; the company renames itself America Online (AOL) in 1991.

1985: The WELL (the Whole Earth ’Lectronic Link), an early virtual Internet community, is created by Stewart Brand and Larry Brilliant.

1985: Lloyd Bentsen coins the term *astroturfing* to refer to organized political campaigns that attempt to hide the sources of their funding and present themselves as grassroots efforts.

1987: Apple Computer includes HyperCard, originally called WildCard, an early hypermedia system, on all new Macintosh computers.

1988: An Internet “worm” created by Robert Tappan Morris infects an estimated 10 percent of Internet hosts; Morris became the first person convicted under the 1986 Computer Fraud and Abuse Act.

1989: Tim Berners-Lee, working at CERN (the European Organization for Nuclear Research),

proposes the protocol for distributing information that is eventually used in the World Wide Web.

1989: Quantum Computing Services, later America Online (AOL), launches the first instant messaging service, also introducing the familiar greeting “You’ve got mail!”

1990: Tim Berners-Lee, along with Robert Cailiau, present the protocol for distributing information eventually used to create the World Wide Web in a paper.

1990: The first Web page was “served.”

1991: The space shuttle *Atlantis* sends the first e-mail message from space.

1991: The first users outside of CERN (the European Organization for Nuclear Research) joined the network.

1992: Delphi becomes the first commercial provider of Internet access service.

1993: CERN (the European Organization for Nuclear Research) announces that the World Wide Web would be freely available for anyone to use.

1993: Over 3 million Americans subscribe to online services.

1993: Mosaic, the first graphical browser, is developed at the University of Illinois, facilitating the development of Web pages.

1993: Howard Rheingold publishes *The Virtual Community: Homesteading on the Electronic Frontier*, a book about virtual communities, including the early online virtual community The WELL.

1993–94: The White House first goes online and uses the Internet.

1994: In February, Jerry Yang and David Filo begin developing an index to keep track of their personal interests on the Internet; it is originally called “Jerry and David’s Guide to the World Wide

Web,” but the title is later changed to Yahoo!; by the fall of 1994, it receives over 1 million hits on a single day.

1994: A forerunner to the smartphone, the IBM Simon Personal Communicator is introduced to the U.S. market. It includes a mobile phone, touchscreen (used by tapping with a stylus), and features such as a calculator, address book, and calendar; can send e-mails, faxes, and text messages, as well as phone calls; and carries a retail price of approximately \$899.

1994: America Online (AOL) begins selling advertisements and grows to 1 million members.

1994: GeoCities, a virtual community that allows users to create their own Web site, and which was organized around the concept of “cities” based on common interests, is launched in California as BHI (Beverly Hills Internet).

1994: The world’s first blog is created by Justin Hall, a college student; he continues publishing “Justin’s Links From the Underground” for 11 years.

1995: Clifford Stoll publishes an article in *Newsweek* with the headline “The Internet? Bah!” and the subhead “Hype Alert: Why Cyberspace Isn’t, and Will Never Be, Nirvana.”

1996: America Online (AOL) grows to 5 million members.

1996: The search engine Ask.com lets users type in queries using natural language rather than key words.

1996: Stanford University students Larry Page and Sergey Brin create a search engine known as BackRub, with the goal of organizing the huge amount of information available on the World Wide Web; they later rename this project Google.

1997: The term *Weblog* is coined by Jorn Barger.

1997: One million sites exist on the World Wide Web.

1997: America Online (AOL) introduces the stand-alone software Instant Messenger, allowing users to chat over the Internet.

1997: Matt Drudge founds the *Drudge Report* online; the site becomes famous when, in January 1998, Drudge publishes information about an alleged affair between President Bill Clinton and Monica Lewinsky on his Web site DrudgeReport.com.

1998: Open Diary, an online community that allows users to create online journals without needing to know HTML (hypertext markup language), begins operation.

1999: The BlackBerry 850, a two-way pager (not a telephone), is introduced.

1999: Blogger and LiveJournal begin operation; like Open Diary, they allow individuals without technical expertise to create online journals or blogs.

1999: Jon Stewart becomes host of *The Daily Show*, a satirical television program on Comedy Central that becomes famous for criticizing the mainstream news media as well as politicians, and becomes an important source of news for many young adult viewers.

1999: The Federal Election Commission rules that online credit card contributions to candidates in the presidential election are eligible for federal matching funds.

2000: Seventy million computers are connected to the Internet.

2000: Google introduces AdWords, an online advertising program whose revenues will reach \$28 billion by 2010.

2000: Advertising for the Swedish company Ericsson refers to its R380 mobile phone, a flip phone using the Symbian operating system, as a smartphone.

2000: Jef Raskin publishes *The Humane Interface: New Directions for Designing Interactive*

Systems, arguing that current interfaces are inefficient and make it difficult for people to use computers effectively.

2000: Senator John McCain raises over \$6 million online over the course of his presidential campaign.

2000: The policy advocacy group MoveOn.org launches an Internet discussion forum.

2000: AOL acquires MapQuest and merges with Time Warner.

2000: Jimmy Wales and Larry Sanger launch Nupedia, the precursor to Wikipedia, as a forum to publish articles by experts in their field as free content.

2000: Josh Marshall founds the political Web site talkingpointsmemo.com.

2000: The dot.com bubble bursts.

2000: In December, the Pew Research Center announces results from a study showing that one-third of Americans who were online got news about the campaign online, for a total of 18 percent of Americans getting news about the election online (as compared to 4 percent in the 1996 election).

2001: In January, Filipinos take part in a mass demonstration against Philippine President Joseph Estrada, organized in large part by forwarded text messages; a large crowd gathers within a few hours, and grows to over a million in a few days.

2001: Wikipedia, the first online, user-created, open source encyclopedia, begins as a side project of Nupedia. The domain name is registered in January, and over 20,000 entries are created in the first year alone.

2001: Meetup.com, a Web site that helps people arrange in-person group meetings based around common interests, begins operation.

2001: StumbleUpon, a Web site that allows users to vote on content they find compelling, begins operation.

2001: Google buys Deja.com's Usenet Discussion Service, including about 500 million archived Usenet discussions; the service is improved and relaunched as Google Groups.

2002: Markos Moulitsas founds the political blog Daily Kos.

2002: AOL has 34 million members.

2002: The social network site Friendster begins operation and later becomes the first social networking site to attract over 1 million users.

2002: LinkedIn, a professional social networking site, begins operation.

2003: The Controlling the Assault of Non-Solicited Pornography and Marketing (CAN-SPAM) Act creates national standards for commercial e-mail but is viewed as largely ineffective in terms of actually controlling unsolicited commercial e-mail.

2002: In December, Trent Lott, then Majority Leader of the U.S. Senate, makes racially charged remarks at the 100th birthday celebration of Senator Strom Thurmond; the remarks are not covered by the mainstream media until after they are published online by several bloggers, and attract sufficient attention that Lott resigned his post, an event often cited as an early demonstration of the political power then held by bloggers.

2003: In January, a survey by the Pew Research Center shows that about 10 percent of online Americans used the Internet as a principal source of campaign news; the Internet remains a relatively minor player, however, as half of those surveyed listed television as their principal source for campaign news.

2003: Google introduces site-targeted advertising, where ads are placed on Web sites based on matches on keywords, domain names, and so forth.

2003: Wordpress, a free, open source content management system, begins operation.

2003: Linden Lab creates Second Life, an Internet virtual world.

2003: Myspace, a social networking site, begins operation; over 1 million people join in the first month.

2004: Almost one-third of Americans (over 60 million people) reported seeing a political documentary in 2004, according to a study released in January 2005 by the Pew Research Center; in contrast, only 7 percent said they attended a campaign rally, and 16 percent said they read a book about politics in 2004.

2004: Democratic presidential candidate Howard Dean demonstrates that it is possible to raise large amounts of money for a political campaign over the Internet, raising more than \$25 million by September.

2004: Digg, an Internet social news-sharing site, begins operation.

2004: Gawker Media founds *Wonkette*, a satirical online political magazine.

2004: Google reports that its index includes 6 billion items, including 880 million images and 4.28 billion Web pages.

2004: Harvard college student Mark Zuckerberg launches TheFacebook.com, a social networking site originally restricted to students from a few elite colleges.

2004: In October, a study released by the Pew Research Center found that the Internet was a minor player in terms of political advertising during the presidential campaign, with \$330 million spent on television ads versus \$2.66 million on Internet ads between January and August 2004.

2004: Flickr, an Internet photo hosting and sharing site, begins operation.

2004: Marc Andreessen and Gina Bianchini found Ning, which grows by 2012 to become the world's largest platform for creating social media Web sites.

2005: Myspace is purchased by News Corporation, Rupert Murdoch's global media company.

2005: In February, Google announces that it has over 1 billion images indexed in Image Search.

2005: In March, the Pew Research Center releases a report stating that 61 percent of Americans who use the Internet (37 percent of the adult population) used the Internet in connection with politics; specific instances of use include contributing to candidates, volunteering for a political campaign, discussing candidates and issues through e-mail, and getting news and information about politics.

2005: In May, Google releases Blogger Mobile, a service that allows bloggers to post and send photos to their blogs from mobile phones.

2005: Arianna Huffington founds the Huffington Post, a news aggregation Web site and blog; the site is sold to AOL in 2010.

2005: YouTube, an Internet video-sharing platform, created by Chad Hurley, Steve Chen, and Jawed Karim, begins operation.

2006: In April, Michelle Malkin founds the political Web site HotAir.com.

2006: In August, a video of Senator George Allen (R-VA) referring to a young man of Indian descent as “macaca” is widely distributed and damages Allen’s re-election bid.

2006: Google announces it has indexed over 25 billion Web pages and 1.3 billion images and receives 400 million queries per day.

2006: In September, the Pew Research Center releases a report stating that 19 percent of adult Internet users (about 26 million Americans) used the Internet to get information or news about politics and the upcoming midterm elections.

2006: In September, Facebook allows anyone 13 and older to register (i.e., a *.edu e-mail address is no longer required).

2006: In November, Google purchases YouTube.

2006: Twitter begins operation, allowing users to send messages of 140 characters or less.

2006: Spotify, a music streaming and playlist-sharing tool, begins operation.

2006: In December, the Pew Research Center releases a study showing that 64 percent of registered voters reported having received robo-calls (recorded telephone messages) during the 2006 midterm election campaign; in contrast, only 24 percent reported receiving campaign phone calls from live callers and 18 percent reported receiving home visitations in connection with the campaign.

2007: In January, the Pew Research Center releases a study showing that 15 percent of American adults used the Internet to get most of their information about the 2006 midterm election; of those who used the Internet for political purposes, 23 percent report creating or forwarding political commentary or videos.

2007: In February, presidential candidate Barack Obama meets with Marc Andreessen to discuss using social media as part of his presidential campaign.

2007: Facebook begins the Beacon advertising system, using information about user purchases to post targeted advertisements to users; the Beacon system is abandoned in 2009, in part due to objections that it violated user privacy.

2007: Brave New Films, founded by Robert Greenwald, releases its first films, *The Real Rudy* (about Rudy Giuliani) and *Fox Attacks* (about the Fox News Channel).

2007: The social networking, photo-sharing, and short-form blogging site Tumblr begins operation.

2007: In June, Apple releases the iPhone, which features a touch screen and allows the user to make phone calls, browse the Internet, and take digital photographs.

2007: In July, Facebook announces it has 30 million users.

2007: The political Web site Change.org begins operation; it attracts 20 million users by 2012.

2008: In January, the Pew Research Center releases a report stating that 42 percent of Americans age 18 to 29, and 24 percent of adult Americans overall, say they use the Internet to find political information.

2008: Nate Silver founds FiveThirtyEight.com, a blog specializing in statistical analysis of political topics (the name refers to the number of members in the electoral college); the blog became an online feature of the *New York Times* in 2010, and became famous in 2012 by combining and weighting polling data to correctly predict the outcome of the presidential election in 49 of 50 states.

2008: Apple introduces the App Store, a distribution platform for applications for the iPhone and iPad; by 2012, the App Store offered over 700,000 mobile applications, and over 25 billion apps have been downloaded.

2008: Clay Shirky publishes *Here Comes Everybody: The Power of Organizing Without Organizations*, a book that argues that social media tools allow individuals to organize themselves and act collectively in ways formerly only possible within organizations.

2008: Google is the most visited Web site in both the United States and the United Kingdom.

2009: Foursquare, a location-based social networking site, begins operation.

2008: In October, Google introduces the Android operating system and it quickly becomes the dominant operating system for mobile phones.

2009: GeoCities, a California-based Web site that facilitated creation of Web pages by nontechnical users, ceases operation except in Japan; it had 38 million Web pages at the time it ceased U.S. operations.

2009: In April, activists in Moldova use social media, including Twitter, Facebook, and LiveJournal, to organize protests against their government.

2009: In April, the Internet fund-raising platform Kickstarter begins operation; it allows people to

pledge money to support other people's projects, in a manner similar to pledge drives conducted by public radio.

2009: In April, the Pew Research Center releases a study showing that over half (55 percent) of adult Americans used the Internet in 2008 to get information about the election or to become involved in politics, and about one-third used the Internet to share political content.

2009: In June, the death of Iranian protester Neda Agha-Soltan is captured on a cell phone; this video (and links to it) rapidly spreads around the world on social media, including Twitter, YouTube, and Facebook, circumventing Iranian censorship.

2009: Facebook becomes the world's largest social network, with over 200 million users.

2009: Captain Chesley B. "Sully" Sullenberger is forced to land a commercial flight in the Hudson River in New York City after the aircraft struck a flock of geese. The first notice of this event is posted on Twitter by a user who saw the event from a ferry.

2010: Crowdrise, a Web site founded by actor Edward Norton, film producer Shauna Robertson, and online retailers Robert and Jeffrey Wolfe, begins operation; it allows users to create fund-raising pages for free and provides prizes to be distributed among those who contribute to charitable causes.

2010: Apple introduces the iPad, and it becomes the dominant tablet computer.

2010: The term *app* (as in "mobile application") is chosen as "word of the year" by the American Dialect Society.

2010: Clay Shirky publishes *Cognitive Surplus: Creativity and Generosity in a Connected Age*, a book in which he posits that online tools allow people to use their leisure time more creatively and productively than was true in the past.

2010: Facebook has over 400 million users.

2010: The Democratic National Committee hires a manager to oversee President Barack Obama's social media accounts.

2010: An estimated 1.97 billion people worldwide use the Internet, amounting to almost 30 percent of the world's population.

2010: The Pew Internet and American Life Project announces that more Americans get news on the Internet than from newspapers.

2010: Pinterest, an Internet social scrapbooking site, begins operation, and acquires 10 million users faster than any other stand-alone site in history.

2010: Dan Savage and Terry Miller found the It Gets Better Project to encourage gay and lesbian young people. Savage and Miller posted a video on YouTube discussing their early lives and how their adult lives were much better than they could have imagined when they were being bullied and harassed as children, and encouraged others to do the same; the project grew so large that it now has its own Web site, www.itgetsbetter.org, which included over 50,000 videos (as of November 2012) and had been viewed over 50 million times.

2010: In December, a study released by the Pew Research Center indicates that 26 percent of American adults used their cell phone in connection with the 2010 midterm elections, either to get information or to participate in some other way, for instance to tell people they had voted (14 percent) or to pass along information about conditions at their local polling place on election day (6 percent).

2010: In December, video of Tunisian protester Mohammed Bouazizi setting fire to himself is captured by amateur videographers and posted on YouTube, inciting protests that eventually lead to the January 14, 2011, abdication of Tunisian president Zine al-Abidine Ben Ali.

2010–11: Social media plays a key role in a popular uprising in north Africa and the Middle East known as the "Arab Spring," although experts debate whether social media acted as an instigator or merely facilitated the uprisings.

2011: In January, President Barack Obama becomes the first speaker in the YouTube World View speaker series; after his State of the Union address, the president answers questions from citizens.

2011: In January, the Pew Research Center releases a study showing that 73 percent of American adults who use the Internet got news or information online about the 2010 midterm elections and 22 percent used Twitter or social networking sites to connect to a campaign or to the election.

2011: The professional social networking site LinkedIn reports that it has 100 million users.

2011: The Pew Research Center releases a report stating that adults who use the Internet are also more likely to be involved in offline group activities, contradicting the stereotype of Internet users as isolated loners.

2011: Lady Gaga and her mother Cynthia Germanotta found the Born This Way Foundation to work with the Berkman Foundation at Harvard University to promote social tolerance, fight against bullying, and encourage young people to build strong communities.

2011: Android becomes the predominant operating system for smartphones, surpassing Symbian.

2011: In May, U.S. Representative Anthony Weiner (D-NY) sends a sexually suggestive photograph of himself over Twitter; he resigns in June as a result of the outcry from this incident.

2011: In July, Ning claims that it is the world's largest social media Web site, with over 90,000 customers in 223 countries, and 65 million unique monthly visitors.

2012: In March, KONY 2012, a short film about Uganda warlord Joseph Kony, is released; it spreads rapidly over the Internet, attracting over 93 million viewers on YouTube alone.

2012: In May, Facebook announces that it has 901 million users worldwide; at this point, if

Facebook were a country, it would be the third-largest in the world in terms of population.

2012: In June, the Federal Election Commission rules that political campaigns may accept contributions by way of text messages.

2012: In September, the Pew Research Center releases a study revealing that one-quarter or more of those who use social networking sites say they are important for political activities—for instance, 36 percent say social networking sites are an important way they keep up with political news, 26 percent say they are important in recruiting people to political causes, and 25 percent say they are an important way to discuss political issues.

2012: In September, a randomized controlled study published in *Nature* and based on the mid-term elections in November 2010 indicates that messages delivered to Facebook users on election day resulted in a small but measurable increase in voter turnout.

2012: In October, the Pew Research Center releases a study indicating that 60 percent of American adults use social networking sites and that two-thirds of those have used social media for political or civic activities.

2012: In October, the Pew Research Center releases a study indicating that 10 percent of those who contributed to one of the candidates in the presidential campaign did so via a cell phone app or by text message.

2012: In November, a picture of President Barack Obama embracing his wife Michelle became the most retweeted and most-liked post in history; posted early in the morning of November 7, when it became clear that Obama had the state of Ohio and thus had won re-election, it was retweeted almost 700,000 times on that day alone, and a posting on Facebook received over 3.23 million “likes” and over 400,000 shares.

2012: In November, over 31 million tweets related to the U.S. presidential election are sent

on November 7 (election day) alone, making it the most tweeted about event in history.

2012: In November, the Pew Research Center releases a study indicating that over half (55 percent) of registered voters had watched at least one political video online in the period leading up to the election; video news reports were the most common type of video reported (48 percent), followed by recorded speeches, conferences, or debates (40 percent), and issue-oriented informational videos (39 percent).

2013: On January 11, Internet activist Aaron Swartz committed suicide. Swartz, who was active in developing the social Web site Reddit, the organization Creative Commons, and the Web feed format RSS, was facing charges under the Computer Fraud and Abuse Act due to his use of an MIT computer in 2011 to download large numbers of journal articles from the digital library JSTOR.

2013: On July 23, the Web site thedirty.com releases pictures and sexting messages sent by New York City mayoral candidate Anthony Weiner under the alias “Carlos Danger”; although Weiner remains in the campaign, his candidacy is severely damaged by the scandal, and he came in fifth place in the vote.

2013: On August 20, The Qatar-based Al Jazeera Media Network launches a new television channel, Al Jazeera America, with headquarters in New York City and 12 bureaus located throughout the United States.

2013: On September 16, the Pew Internet & American Life Project reports that a majority of the American public owns a smartphone, that 63 percent of adult cell phone owners use their phone to get online, and that 21 percent of all adult cell phone owners do most of their online browsing from their phone, not a computer or other device.

AARP

AARP (formerly known as the American Association of Retired Persons, and now known simply as AARP) is a nongovernmental public interest organization that assists communities and older people with health care benefits, employment security, and retirement planning. Dr. Ethel Percy Andrus founded AARP in 1958 as an extension to her previous organization, the National Retired Teachers Association (NRTA). NRTA assisted retired teachers who were in need of health insurance. AARP is also a powerful lobbying group.

There are two AARP organizations: AARP Services and AARP Foundation. AARP Services offers supplemental insurance and discounts on travel and consumer goods, while the AARP Foundation operates like a charity. They both focus on providing better income and housing and alleviating hunger for senior citizens. The goals behind the creation of AARP were (1) to promote independence, dignity, and purpose for older persons; (2) to enhance the quality of life for older persons; and (3) to encourage older people “To serve, not be served.”

AARP Services provides members with discounts on goods and services such as groceries, dining out, electronics, rental cars, hotels, and airline tickets. It also offers insurance benefits,

such as health, home, and auto insurance. There are AARP credit cards and retirement planning options. These discounts and optional benefits are solely for the members of AARP.

AARP helps organize volunteering in communities across the United States. One of their outlets is Create the Good. This organization has over 2,000 volunteer options. Create the Good allows volunteers to do simple tasks around the community, such as collecting school supplies, as well as help health professionals, assist in classrooms, and read at local libraries. Depending on specific locations of members, options for volunteering are vast.

Branding and Promotion

In order for AARP to promote its name and brands, it has created commercials, magazines, and Web sites. AARP also has several different types of commercials on television. These range from promoting health insurance and life insurance to advocating for older persons' benefits. By promoting their various options for members through different commercials, people looking for diverse facets of AARP will be reached. By using television as a source of recruitment, AARP reaches a broader scope of older persons than it does through its use of Facebook and Twitter.

On its Web site, AARP lays out the key components that older persons are looking for once they

have retired or are looking for what comes next in the steps to retirement. There are links to spotlight stories relevant to topics chosen via links at the top of the page. Each link offers support in areas of member benefits, health, work and retirement, money, home and family, and other issues relevant to the typical AARP member. The site is relatively easy for members to navigate and understand. Another interesting link on the AARP Web site is their game link. These games seem simple enough to the everyday Internet user, but are chosen to help stimulate the brain. Games such as mahjong, bridge, and solitaire are available to be played online. There are also crosswords, black-jack, and even disco bowling.

Social Media

Recently, AARP completed a study examining how adults over age 50 use technology and social media. After gaining a sample of 1,360 adults over age 50, GtK Custom Research analyzed the findings. Results showed that 40 percent of the sample felt at ease using the Internet and many accessed the Internet from their desktop computers. About 27 percent used Facebook for social networking.

One of the best ways of getting the AARP name out into the social media world is through Facebook and Twitter. These two sites are a quick and easy way for people to locate information and collaborate with others in their same situation. On Facebook, members can get information via their state's specific pages, the national page, and a link to the AARP Web site. This is also a great way for AARP to promote events, volunteer opportunities, and specials on memberships. The microblogging site Twitter is also a quick way to communicate with members of AARP. Though Twitter has been dominated by a younger demographic, AARP has numerous state and national Twitter accounts.

Conclusion

Since 1958, AARP has helped popularize the idea of older persons continuing to live very active lives. With the Internet and commercials on television, radio, billboards, and in magazines, AARP has become the widely known option for retired or retiring Americans. Though AARP is not the only option for older persons looking for insurance,

benefits, and volunteer ideas, it is widely recognized as a good option. It is also widely talked about among several age groups.

Activists and Activism, Digital

Activism is engagement in activities designed to foster social change or, alternatively, to resist it. Usually, there is a great deal of conceptual overlap between activism and participation in a social movement, though social movements, by definition, involve participation by collectivities of individuals and organizations. Activism, in some rare instances, may be initiated by individuals or small groups.

Conventional wisdom argues that people participate in collective action and social movements because they have strongly held beliefs or are highly discontented about something. However, a number of social movement scholars have pointed out that discontent or ideological support of a movement's goals are usually not enough to

ensure an individual's engagement in activism. Indeed, the vast majority of people who typically support a movement's goals remain inactive. What is important to whether or not people participate is whether they have social network ties to other participants and become targeted for participation requests.

The scholars Bert Klandermans and Dirk Oegema argue that at the level of the individual, becoming a participant in a social movement can be conceived of as a process with four different steps. The steps are: (1) becoming a part of the mobilization potential (e.g., sympathizing with the movement's goals); (2) becoming a target of mobilization attempts; (3) becoming motivated to participate; and (4) overcoming barriers to participate.

Another factor that influences participation is whether or not individuals are biographically available to participate. That is, are their personal schedules sufficiently free or flexible to allow participation in activism? For instance, full-time employment and child-rearing obligations are two barriers to social movement participation.

Whether or not one participates in activism is also affected by the risks and costs involved. Activities vary in terms of the risks that activists may face such as the likelihood of physical violence. Activities also vary in costs in terms of money and time.

Identity is another important aspect of social movements. Individuals are more likely to engage in collective action if they have a shared collective identity. Social networks provide referent others and groups with whom an individual can make social comparisons in the collective identity formation process.

Individuals who are more embedded in a social network tend to have higher levels of movement identification. This is a reciprocal process. The higher one's identification with the movement, the more motivated one is to make social ties to other movement participants. On the other hand, the more ties one has, the more information one receives about the movement and the more likely one is to receive support for identifying with the movement. Some social movement scholars see collective identification as a necessary condition for collective action. Other scholars see the creation of new

identities as being an outcome of particular social movements.

Social Networks

Social networks are thought to be a key aspect of social movement phenomena. A social network refers to a set of social units (individuals, groups, and so on) and the interrelationships among them. In recent years, social movement scholars have given considerable attention to social networks in social movements.

Digital social networks (such as those created through Facebook or Twitter) are just one mode of social networks. Researchers have long known about the importance of interpersonal networks based on face-to-face interactions and/or joint memberships in groups (such as social movement organizations). In recent years, attention has turned to the role of digital social networks.

In previous studies on face-to-face social networks, the following intervening variables have been implicated as relevant to network mechanisms: (1) communication, (2) recruitment appeals, (3) identification, (4) social influence, (5) incentives and sanctions, (6) social support, (7) socialization, (8) knowledge and information, (9) personal efficacy, (10) norms, (11) subjective interest, (12) beliefs about others' willingness to contribute, and (13) trust.

Social media and related digital technologies may modify these and other traditional social movement processes. For instance, biographical availability is thought to influence participation and, relatedly, to be associated with the costs and risks of participation. But, for some types of activism, social media and other digital technologies may bring down costs, so biographical availability may not be a barrier to the same extent as for some types of offline activism.

Relatedly, the relationship between network ties and identification may be modified in similar ways. Indeed, in offline activism, participation in certain types of activities—such as attending a rally or protest demonstration—involves potentially revealing one's personal identity and the linkage between personal and collective identities. Certain types of social media (such as Twitter, for example) allow one to engage in social movement discourse and other forms of activism without necessarily revealing one's true personal identity.

Digital Activism

Social media is intertwined with the World Wide Web, the Internet more generally, and mobile phones. Many social movement organizations and social movement activists have Web sites where people are invited to follow them via Facebook and Twitter. Many social media posts link to Web sites. Many people utilize social media via their mobile phones. Many social media functions are linked to e-mail. Thus, this suite of digital technologies needs to be considered simultaneously.

Social media and other digital technologies are revolutionizing the way people live and how they communicate and interact with others. They have enabled the development of transboundary social networks, and the speed, reliability, scale, and relatively low cost of digital networks have in turn allowed for an unprecedented expansion in the scope and reach of contemporary activism. Digital activism refers to the use of digital technologies, such as mobile phones and Internet-enabled devices, in campaigns for social and political change. Indeed, contemporary social movements are using these technologies as tools of communication and mobilization and to access alternative forms of media, which serve as both a means and target of social and political protest.

One of the first social movements to use the Internet was the Zapatista movement in southern Mexico in the early 1990s. In this movement, the Internet, along with telecommunications and videos, was instrumental in disseminating information from the Zapatistas to the rest of the world and in organizing a global network of solidarity groups, which helped to create an international public opinion movement that deterred the Mexican government from engaging in extensive repression.

A few years later, antiglobalization protests in Seattle, Montreal, and Genoa were supported by e-mail systems, the World Wide Web, and the short message service (SMS). The use of the Internet and other digital technologies for the purpose of movement activity has increased and diversified in the 21st century, even within the realm of institutional politics. For example, strategic voting emerged as an online movement during the 2000 U.S. presidential election as a way for American citizens to renegotiate their participation in the electoral process by using Web sites that were designed by several individuals and small groups

to allow voters from different states to coordinate their votes. Social media played an important role in Barack Obama's first successful campaign for president of the United States in 2008.

Such examples illustrate the instrumental function of digital technology with respect to social and political activism; it helps communication in information dissemination, networking, and action coordination. Less often discussed—and more contentious, as is discussed below—is the symbolic role that this technology plays in social movement activity. By serving as a potential forum for the development of a sense of solidarity, commonality, and trust, the Internet and other information communication technologies (ICTs) can help build a collective identity among participants and supporters of a movement.

These two major functions of digital technology are copresent to varying degrees depending on the type of activism under consideration. There are four broad categories in which participation using social media and other kinds of digitally enabled social movement activities can be placed. The first entails information distribution through Web sites, listservs, and Internet-enabled devices wherein these technologies serve not as interactive media but as information hubs about causes, social media organizations (SMOs), and social movements.

The second category includes online activities (such as social media) in support of offline protest events such as marches and rallies. Such activities include providing information on, and logistical support for these events as well as recruitment of participants and supporters. Here, too, the Internet does not serve as an independent arena of activism; rather, it is simply a space for organizing and coordinating nondigital activism.

Third, digital activists make use of social media and other online avenues for participation, such as online petitions, boycotts, letter-writing, and e-mail campaigns and more contentious forms of Web site “hauntings” and virtual sit-ins. Last, the fourth category encompasses the organization of entire campaigns and movements online—sometimes referred to as e-movements. In this type of digital activism, all aspects of organizing take place without face-to-face coordination; social media, Web sites, blogs, or listservs are often the organizing centers of protest action.

Effect of Digital Technology

A major debate among scholars of digital activism pertains to the question of whether its fundamental driving processes differ from offline activism. Does utilization of social media and other digital technologies for the purpose of social movement activity amount to a qualitative or merely quantitative shift in activism? Put differently, do these relatively novel technologies have any enduring impact on activism, and if so, do they simply augment activism, or do they alter it in a more fundamental way. The debate on this issue has unfolded among scholars in three clearly discernible camps.

Those in the first camp argue that, over the long term, there will be no real, lasting impact of usage of digital technologies on social movement processes. According to this approach, the digital network is a poor substitute for face-to-face interactions in terms of its ability to foster the enduring bonds of trust and commitment thought to be critical to mobilization. Some within this camp further argue that the digital divide—the uneven distribution of access to, use, and knowledge of ICTs—undermines the impact of the Internet on activism or even risks further disenfranchising those without ICT access.

Scholars in the second camp contend that the differences between online and offline activism are in degree rather than in kind. Along this line of thought, the effects of social media and other digital technology on activism can be considered scale-related effects because ICT usage is seen as simply augmenting or accelerating the processes driving contemporary activism and protest by, for example, enabling a transboundary or fully global reach. Further, although social media and the Internet (more broadly) may allow for relatively inexpensive and quick dissemination of information, they do not change the fundamental nature of the activists, what they do, or how they do it, explain Lance Earl and colleagues in addition to Jennifer Bennett.

The third camp is populated by those who argue that some uses of ICT may in fact alter the dynamics of activism in significant, “game-changing” ways. First, some scholars taking this position insist that the low cost of ICT-enabled social movement activity has significantly decreased costs to the emergence, expansion, and success

of movements. The alteration of resource costs has consequences for the probability of successful mobilization. Second, it is argued that the proliferation of ICT has led to the emergence of new and fundamentally different kinds of social protest activities, bundled together in an emergent “digital repertoire of contention.” The resultant “*new new* social movements” are conceived of as diffuse, relatively unstructured, and capable of bringing together activists with diverse backgrounds in virtual public spheres.

These “internetworked movements” depend more on information exchange and communication than on the support of traditional SMOs, the importance of which has also been undermined more simply by the low cost of online organizing. Therefore, in the modern social movement, social activism is becoming less reliant on institutions as individual activists themselves—movement entrepreneurs—are gaining greater capacity to participate in an increasingly diverse set of movement activities. Indeed, as a result of the proliferation of digital technology, the social movement has been shifting from the “grand coalition” among SMOs toward ad hoc, ephemeral, group-based, “direct action politics.”

Some scholars argue that the meaning and structure of activism have been transformed by the use of social media in particular, which has allowed for small-scale, many-to-many forms of politically oriented communication or “microactivism.” Actions such as the formation of political Facebook groups, retweeting of articles of political interest, and sharing videos of a political nature on YouTube reflect microlevel intentions and are not necessarily geared toward mobilization.

However, while the two latter camps differ with regard to their estimations of the effects of digital technology on activism, they tend to focus on different types of protest. Indeed, the scholars who find that social media and other online technology simply augment or accelerate the drivers of contemporary activism tend to study online activities that support or facilitate offline protest, whereas those who find more fundamental changes have been largely focusing on online mobilizations. In the first case, social media and other ICTs allow for movement-related messages to be spread globally, instantaneously, and inexpensively to gain broader support for a movement

These protesters in New York City gathered in support of Egyptian democracy activists on January 29, 2011, in the early days of the Arab Spring protests. The Occupy Wall Street protest movement, which began in New York City on September 17, 2011, and spread to numerous cities, drew inspiration in part from the Arab Spring movement earlier that year.

but do not thereby alter the fundamental dynamics of the offline struggle.

In the second case, however, the dynamics of online disruption are likely to differ from those of offline protest; for instance, protesters are less likely to be motivated by group solidarity than by the perceived effectiveness of the protest action compared to offline activists. Further, as a result of the speed, convenience, and general appeal of social media and other ICTs, the demographic composition of activists is shifting and diversifying. For example, the technological leap experienced in the developing world wherein most young people own mobile phones even if their homes are without electricity or running water has opened up the world of activism to those who may not otherwise have participated in it. This is also the case with youth in general, among whom the use of digital technology, and social media in particular, is disproportionately intensive and widespread.

Among those who agree that digital technology has changed the game of contemporary activism, there is acknowledgment of both the

benefits and limitations of this technology. On the one hand, the Internet has several advantages as a public sphere; as alluded to above, it opens up space for ordinary citizens and groups typically excluded from mainstream media to gain visibility and forge links across a range of issues. Indeed, those mobilized across digital networks against neoliberal globalization are increasingly afforded greater opportunities to exchange information outside the control of the dominant media corporations.

The emerging digital community and social relations have been characterized as decentralized, democratic, heterogeneous, fluid, open, informal, and in many ways self-governing. In particular, the ease with which individuals can generate and share content via social media is seen by some as indicative of a more democratic and egalitarian society. Social networking Web sites and services provide “radical public spheres” that constitute new forums for the development and expressions of political citizenship, forums that are less subject to elite control.

On the other hand, some scholars argue that such microactivism may do more harm than good. Although social media provide new and open spaces for social and political engagement, the ease with which individuals can create and join communities of interest may in fact detract from more serious and coordinated efforts to bring about social and political change, resulting in weak ties and low-risk activism or “slacktivism.” Liking digital items on Facebook or retweeting a news story demands little effort but the positive feeling derived from engaging in such activity may satisfy one’s need for social connection, negating the drive to interface with formal political power.

Nonetheless, the proliferation of online spaces to craft political identities helps “bind politics to everyday life,” states the scholar José Marichal. Indeed, some scholars have asserted that the proportion of the population (in Western societies) that is considered to be part of a social movement is somewhat exaggerated. This points to one way in which this exaggeration may get fostered: participation in trivial, low-cost, and low-impact activities that participants self-perceive as meaningful social movement activity. Indeed, this insight might serve as a counterpoint to the “social movement society thesis,” that scholars David Meyer and Sydney Tarrow describe as the routinization and institutionalization of social movements and protest in Western societies.

Web-Supported Offline Mobilization: The Arab Spring

In the 2011 Arab Spring protests, social media networks facilitated the rapid collapse of two regimes, Tunisia and Egypt, and aided sociopolitical mobilization in Bahrain and Syria. Protesters used Facebook, Twitter, and YouTube to schedule and coordinate the protests and to share their plight with the rest of the world. Thus, digital media undoubtedly played an important role in the political upheavals in the Middle East, which spawned a revolutionary fervor that spread across regions, countries, and continents. Indeed, Occupy Wall Street, which began in New York City and spread to countless other cities across the globe, drew tactical inspiration in part from the Arab Spring. So, too, did the student protests in Quebec, Canada, organized under the banner of the Maple Spring.

A matter of contention, however, is how significant the role of social media was in bringing about the uprisings in the Arab region. Some skeptics argue that real, progressive sociopolitical change is brought about by high-risk activism, strategic hierarchies, and a precise division of tasks; social media, rather, creates loosely structured and relatively leaderless networks incapable of launching revolutions. Consequently, these networks have a difficult time establishing goals and achieving consensus.

Further, some have argued, the protest movement in the Middle East was ultimately caused by the underlying sociopolitical and socioeconomic conditions in the region. For example, in Egypt, the sociopolitical disparity between the small ruling elite and the masses had long reached critical levels, “prompting most experts on the region to expect a major upheaval at some point,” states scholar Ekaterina Stepanova. Indeed, a variety of cautions have been employed against overgeneralizing about the importance of social media in these cases. For instance, food prices and food shortages played a role. In some countries (such as Tunisia), there was a relatively highly educated and underemployed youth cohort. Further, some scholars have argued that old-school technologies such as fax machines actually played significant roles in some instances. Also, some scholars have noted that Western journalists focused mostly on English-language Twitter posts, blogs, and so on, and this may have distorted the centrality of these technologies to those living in the affected countries.

However, while social media was not the sole cause of these revolutions, it enhanced the ability of citizens to affect domestic politics. Indeed, the fact that the movement occurred and spread as quickly and garnered the participation and support that it did was largely due to the mobilizing effects of ICT and social media tools, access to which significantly lowered the costs of collective action, especially for protesters in Tunisia and Egypt. The use of Facebook, Twitter, and YouTube galvanized the movement by revealing the extent of concern for and commitment to addressing the sociopolitical and socioeconomic issues faced by citizens in the Arab region and, therefore, fostering a “public sense of shared grievances and potential for change.”

For example, before and after the protest events, social media messages about liberty, revolution, and freedom were sent worldwide, and the offline protests often followed sharp increases in revolutionary conversations. Further, Tunisia, with a very large population of Facebook users, and Egypt, with more Internet users than any other country in the region save Iran, experienced greater civil disobedience and pressure toward change. Thus, social media also aided in the organization of the movement by synchronizing the actions of the impassioned public, allowing citizens to unite and coordinate rapidly and on a larger scale than would have been possible in the absence of these media technologies. This function is particularly critical in the context of states that exercise tight control over access to mainstream sources of information and means of communication.

Therefore, although social media may be deemed a “weak activist” tool by some, in the case of the Arab Spring, it was used to encourage and facilitate risky offline activism; protesters filled the streets to demonstrate against—and indeed overthrow in some cases—some of the world’s most enduring and unruly dictatorships. In other words, in the case of this movement, the use of digital media enhanced the scale, speed, and reach of the mobilizations. As such, the impact of digital technologies on activism in the context of the uprisings in the Middle East is illustrative of the second thought camp outlined above.

Online Mobilizations: Hacktivism and Anonymous

Much of the world’s attention has recently been captured by Anonymous, the “rhizomatic, digitally based protest movement,” according to scholar Gabriella Coleman. Although initially a name used to coordinate Internet pranks, Anonymous has become a worldwide, decentralized network of individuals focused on promoting freedom of information, expression, and transparency—even as they remain committed to protecting their own privacy and identities. This clandestine, anarchic online group is steeped in hacktivist culture, which was birthed through the Internet. The term *hacktivism* is an amalgamation of the words *hacking* and *activism* and describes politically motivated hacking. It involves digital

protest activities such as virtual sit-ins or denial of service (DoS) attacks, which entail targeting Web sites or online applications with false external requests so that they are unable to respond to legitimate traffic, as well as defacement of Web sites or “e-graffiti.”

Anonymous emerged out of an extremely popular Internet image board called 4chan, where users engaged collectively in online pranks, says Coleman. Beginning in 2008, some factions of Anonymous began to engage in political action—launching DoS attacks, creating and circulating images and videos, as well as taking to the streets, first protesting against the abuses of the Church of Scientology, then in 2010 against the Motion Picture Association of America in support of the file-sharing Web site The Pirate Bay and against PayPal and MasterCard in support of WikiLeaks, the online organization dedicated to facilitating whistle-blowing and publishing classified materials.

Another turning point in the development of Anonymous as a political protest movement came during the Arab Spring in 2011, when they aided the antigovernment protesters in Tunisia by launching DoS attacks against government and tourist Web sites, circulating videos of the street violence and compiling information packets for Tunisian cyberactivists and protesters detailing how to evade government surveillance, describes Coleman.

While Anonymous has continued since then to engage in a wide range of operations elsewhere in the Middle East as well as Europe, the group has paid particularly close attention to the activities of the U.S. government since the suicide of Aaron Swartz, digital activist and former co-owner of the social news Web site Reddit. At the time of his death, Swartz was facing up to 35 years in prison and a fine of \$1 million for the alleged theft of online journals with the intent to post them on the Internet.

In response, deeming the case against Swartz “a grotesque miscarriage of justice,” Anonymous launched Operation Last Resort, a campaign in protest of the American criminal justice system and cybercrime laws. This operation largely involved hacks on the property and databases of the U.S. government, including defacing the Web site of the U.S. Sentencing Commission, replacing the home page with a video and a message that

read, “The federal sentencing guidelines enable prosecutors to cheat citizens of their constitutionally-guaranteed right to a fair trial”—a reference to the fervent pursuit of charges against Swartz and a justice system whose minimum sentencing laws unduly empower government prosecutors to elicit guilty pleas from suspects afraid of facing hefty prison sentences at trial.

Anonymous is a self-described decentralized network and purports to have no leaders, hierarchical structure, nor any geographical epicenter, according to Coleman. Membership is open to all—Anonymous is a name that any individual or group can adopt as their own. However, even though there are no formal barriers to participation, there are certain kinds of knowledge, skills, and values that lead some and not others to engage in such “electronic civil disobedience.” These include computer programming and hacking skills as well as various digital media literacies, such as video editing, Web design, and the technical capability to use Internet relay chat (IRC). Thus, although Anonymous has no formal leader, the IRC operators hold more authority on the chat and are charged with maintaining order, explains Coleman.

Further, although the group maintains an anti-leader ethic, when it comes to operations like targeting hacking, only a relatively small group of extremely tech-savvy Anons can participate. While the “power to hack” does not translate into the power to lead all actions within the movement, those who have more of a presence on IRC, have put in more work, and have taken greater risks carry somewhat more authority.

Indeed, because what Anonymous and other hacktivists do is in the fuzzy, gray area of legality, if not outright illegal, their brand of social movement activity carries more risk than other forms of digitally enabled protest, such as signing an online petition or creating a Facebook group about a relevant sociopolitical issue, the opportunity costs of which are negligible. To be sure, hackers in general tend to have higher confidence in their approaches to problem solving and engage in more risky behavior than the general public. However, it is debatable whether online protest activities such as targeting hacking carry more risk than traditional forms of protest; nonviolent, offline protests have been historically

Aaron Swartz, the former co-owner of Reddit and a digital activist, in Boston, Massachusetts, in 2009. Swartz committed suicide on January 11, 2013, while being pursued on charges of wire fraud and violation of the Computer Fraud and Abuse Act.

effective because participants faced risks of serious personal harm, either from the violent suppression of opposing authorities or from the participants themselves. Further, as mentioned above, in general, the riskiest hacktivist activities carried out under the banner of Anonymous are performed by only the most technically proficient sects, who are extremely skilled and knowledgeable when it comes to concealing their identities and physical locations, treating anonymity as a political tool to regulate risk as well as accountability. On the other hand, the power structures against which the group organizes are disposed with highly sophisticated and resourced agencies geared toward protecting the digital security of the state apparatus from such threats and identifying the culprits.

At any rate, the disruptive online tactic known as hacktivism and those who perform it such as

Anonymous are strong candidates for elements of contemporary activism, which might be said to be game changers. Indeed, although Anonymous engages in online activities that support offline activism, and participates in the offline protests themselves, the nuance of this movement lies in its use of such digitally based civil disobedience. The dynamics of this kind of online protest likely differ from offline forms, both in their organization and their role in contentious campaigns. By coordinating and carrying out skilled, targeted attacks on the computerized and virtual assets of those in power in the context of a relatively decentralized, faceless global network, Anonymous serves as a compelling illustration of the groundbreaking brand of activism conceived of within the third camp discussed above.

Conclusion

Social media and other digital networking technologies are central to contemporary activism. They can greatly reduce the costs of organizing and increase the efficiency of organizing. Social media and related digital technologies can provide information about events and about substantive and ideological issues. Again, this can be done more efficiently—such as by providing links to uniform resource locators (URLs).

Social media can have subtle effects with regard to interpersonal social networks. For example, social media can provide an indicator of the numbers of others who support or participate in a movement and which, from the individual perspective, may affect the tipping point or threshold for influencing one's participation. Social media can provide reference points for self–other comparisons that are utilized in the formation of collective identities. Indeed, social media can make people's social networks more visible (for instance, by showing the friends of an individual's friends on Facebook, information that is not usually as systematically available for offline social networks based on face-to-face interactions). At the same time, it can also distort perceptions about the composition of a given actor's social network (e.g., when an individual friends strangers on Facebook or starts following unknown Twitter followers).

In *Digitally Enabled Social Change*, Jennifer Earl and Katrina Kimport talk about two schools of thought about the effects of the Web on

activism: (1) supersized—it magnifies traditional processes; and (2) Theory 2.0—it actually changes the processes that underlie activism. These conjectures continue to constitute hypotheses for future research on social media and activism.

Actors and Social Media in Politics

After the 2008 U.S. presidential election, pundits began to describe Barack Obama as the first technological or social media president. While part of this moniker was due to the president's desire to retain his personal technology, such as his BlackBerry and e-mail, after being sworn in, it also referenced his use of social media during the campaign. One of Obama's Web sites, My.barackobama.com, was the hub of a carefully constructed campaign designed to utilize social media for encouraging voter turnout, soliciting campaign contributions, sharing information, and encouraging civic engagement. Celebrities such as Chris Rock, Orlando Bloom, and Matthew Broderick were featured prominently in many of the

social media efforts, especially YouTube videos showing how regular people could help Obama, just like their favorite celebrity, by taking the day off to help on election day or making campaign phone calls. A similar campaign was used in Obama's 2012 re-election effort with celebrities such as Penny Marshall and KaDee Strickland.

Political Campaigns

In addition to showcasing the potential of social media, Obama's 2008 election also heightened awareness and discussion of celebrity endorsements of political candidates. The partnership of politicians/political parties and celebrities is not a modern phenomenon. Warren Harding's 1920 presidential election saw celebrity endorsements from Mary Pickford, Douglas Fairbanks, and Al Jolson. Franklin D. Roosevelt had the support of luminaries such as Judy Garland, Humphrey Bogart, Orson Welles, and James Cagney. President John F. Kennedy was endorsed in 1960 by Sammy Davis, Jr., and Dean Martin. Ronald Reagan, not surprisingly due to his Hollywood background, received support from many celebrities including Frank Sinatra (who personally planned inauguration events after both of Reagan's elections).

In the early days, however, celebrities were more on the fringe of campaigns serving as quiet fund-raisers or doing meet-and-greets. Today celebrities have become actively involved in election campaigns and they are not afraid to voice their opinions. Conversely, politicians have "gone Hollywood" by appearing on entertainment programming (starting with candidate Bill Clinton's saxophone playing on the *Arsenio Hall Show* up to Vice President Joe Biden's appearance on *Parks and Recreation*). While it is clear that politicians rely on Hollywood actors for visibility and fund-raising, any impact that such endorsements have on voting or opinion formation is much less clear.

The 2008 election, however, provided an opportunity to conduct a broader study of the effect of celebrity endorsements on political elections due to the long duration of the contest, as well as the number of celebrities involved, especially Oprah Winfrey. Winfrey is one of the most influential media figures today not just because of her television ratings, but also her ability to influence opinion and purchase decisions. Books selected for her book club become best sellers, including Obama's

Oprah Winfrey at a rally in support of then-candidate Barack Obama and his wife Michelle Obama in December 2007. One estimate found that Winfrey may have brought the 2008 Obama campaign as many as 1 million votes through her endorsement.

book, *The Audacity of Hope*, which was touted on her show in 2006, and her annual list of favorite items drives sales. In addition, prior to 2008, Winfrey had never endorsed any political candidate, which gave her endorsement of Barack Obama additional credibility. Studies of her impact on the election resulted in the discovery of what has been dubbed “The Oprah Effect.” The Oprah Effect is a calculation of how many votes Obama earned due to her endorsement of his candidacy. The formula estimated that over 1 million votes were cast for Obama because of Winfrey’s support. The thought is that if Oprah can bring 1 million votes, other, even lesser, celebrities could have a similar impact, even if it is only thousands or tens of thousands of votes generated.

Platforms

In order for the media or celebrities to have an impact on someone’s point of view, the message must first be created, circulated, and then repeated, usually by opinion leaders (family members, valued friends, or celebrities). In other words, people need to have access to the conversation before the conversation can change their views. This is where social media can heighten the potential impact of a celebrity endorsement. Social media is a global platform for opinion leaders of all kinds. In fact, good use of social media can turn the average person into a world-wide opinion leader. Perez Hilton, for example, began as a simple blogger who was an unknown until he used his social media footprint to build a brand of celebrity gossip that has now become a leading source of celebrity news.

Social media thus becomes another platform for promotion, whether it is the promotion of movies, books, or social/political causes. Celebrities must always ensure that whatever they are posting or supporting works to maintain the brand that the actor and his/her team have carefully created. Branding is not a new concept in the digital age. Fans’ perception of an actor are based on a created image that is devised by an actor’s team, or, in the Golden Age of Hollywood, the studio that owned the star’s contract. Fan magazines, fan letters, and appearances on radio and television used to be the ways in which fans learned more about their favorite celebrity. Now this information is carried (often in real time) through Web sites, Facebook pages, or Instagram. One of the key differences between the traditional media fan/celebrity interaction and social media interaction is that the frequent updates/posts shared through social media convey a greater sense of personal connectivity between the celebrity and the fan. In social media, celebrities are able to control the ways in which they reveal themselves to their fans. It is their choice to say what they want and when they want it. They can let fans see a part of their lives that would otherwise be off limits even to the paparazzi. The result is a sense of greater connection between the fan and the actor.

The current trend of posting “selfies,” or photos of a celebrity that they take of themselves (usually with the help of a mirror) often in a bedroom, bathroom, or behind-the-scenes area, allows fans

into the most private of spaces. Of course, such intimate glimpses of a celebrity's life are only available to fans that have been "invited," by agreeing to follow or "like" the celebrity.

Celebrities are opinion leaders and thus have a greater potential to impact thoughts and decisions, even if the impact is to only reinforce an already held belief. It is not uncommon for a fan to buy a product simply because their favorite celebrity endorses or recommends it. In one study by Ani Istanboulian, 43 percent of respondents indicated that they have learned more about a cause because of a celebrity they follow online.

This is not necessarily unique to social media. In World War II, the government relied heavily on celebrities to help sell war bonds or to create propaganda films that raised the spirits of the troops and citizens on the home front. Actors also worked to reinforce the official government discourse about what was occurring overseas. In addition, celebrities also worked to influence the government's stance on issues relating to how to fight the war. For example, Walt Disney created the 1943 animated/live-action film *Victory Through Air Power* to try to convince the U.S. government to shift its military strategy to dominance in the skies (through war planes) rather than on the ground or sea. The film was a visual adaptation of Alexander P. de Seversky's book and featured de Seversky in the live action portion of the film. Disney was a firm believer in de Seversky's theory of the importance of air superiority and thus served as an endorser of this cause.

Social Media Reach

While politicians or political causes have always looked to celebrities to bring visibility and dollars to their campaigns, social media increases the volume and reach of the conversation. In addition, social media tools create a straightforward system for tracking the potential strength of a celebrity endorsement. The number of followers that a celebrity has on Twitter or Facebook, for example, is a strong predictor of their popularity and potential influence. Lady Gaga has over 38 million followers on Twitter and over 57 million on Facebook. Justin Bieber has over 2 billion views on YouTube and over 40 million followers on Twitter. Oprah has over 19 million followers on Twitter and 8 million "likes" on Facebook.

Conversely, Bill Clinton has less than 800,000 Twitter followers. But how does this translate into influence?

In June 2013, a teenage girl posted an Instagram picture of Justin Bieber—who she happened to be sitting next to at an NBA basketball game. Her Instagram following jumped to over 1,000. However, subsequent pictures showed the young pop star touching her arm (most reports say the touch was accidental contact). Justin Bieber fans viewed the image differently and mistakenly thought that the two were dating. The picture went viral and the "Beliebers" (the name given to Bieber's dedicated fans) began to send the girl death threats and hate posts. As a result, she had to change all of her social media profiles to private settings, as well as leave the game early as she feared for her safety.

While this example is extreme in terms of showing the influence that celebrities can have on their fans, as well as how that influence can escalate very quickly in social media, it also points to the fact that fans can be radical in their feelings about a celebrity. In addition, it shows that age matters in terms of possible impact of a celebrity endorsement. If a voter or consumer is younger, they are more likely to be influenced by a candidate or product endorsed by a celebrity, especially if the celebrity himself or herself is younger. This does not mean that older celebrities are not useful as endorsers, it just indicates that it is important to know the audience that is being targeted when seeking the support of a celebrity. There are some celebrities, however, that have been shown in a study in 2007 by *Forbes* to have a negative influence on opinion: Rosie O'Donnell, Madonna, Jane Fonda, Tom Cruise, and Donald Trump.

Influence can also be seen in a celebrity's Klout score, which tracks influence across eight social media platforms. A Klout score is based primarily on the topics discussed, people's reaction in terms of "likes" and retweets, who posts are shared with, frequency of posts, and number of followers. The highest Klout scores (out of 100) belong to Justin Bieber, Justin Timberlake, and Rihanna with 93. They are followed closely by Lady Gaga, Taylor Swift, Oprah Winfrey, and Stephen Colbert (who helped convince Bill Clinton to join Twitter). An interesting note is the decline of Ashton Kutcher, who was once seen as the pre-eminent social media

user. However, Kutcher suffered very negative publicity over a series of tweets, especially regarding his dismay over the firing of Joe Paterno. After this incident, Kutcher turned his social media accounts over to a public relations firm. As a result, Kutcher's Klout score dropped to a low 87.

Comedians

While Kutcher may not have benefited from tweeting controversial statements, numerous comedians have made their livings by criticizing politicians or social issues in a humorous, but sometimes controversial manner. Bill Maher's *Politically Incorrect* and Dennis Miller, the faux news anchor from *Saturday Night Live* who followed up with his self-titled show, shaped a genre of entertainment in which the lines between comedian and commentator became blurred. Such faux newscasts or talk shows gained tremendous popularity on Comedy Central in the early 2000s.

The Daily Show with Jon Stewart and *The Colbert Report* (both on Comedy Central) have taken the satire and parody of news and politics to new levels. One key difference is that now the politicians are in on the joke and use the shows to promote their agendas. *The Daily Show*'s "Indecision 2008," Stewart's "March to Restore Sanity" versus Colbert's "March to Keep Fear Alive," and Jon Stewart/Bill O'Reilly's "Rumble in the Air Conditioned Auditorium" brought significant attention to the presidential campaigns while providing issue information to the shows' fans. The messages are conveyed through social media with Facebook, Twitter, and dedicated Web sites serving also as platforms for discussion.

It has been noted that younger voters rely more on the above shows for news regarding elections or current events than they do on traditional media. Other comedians, however, have taken a more straightforward approach to message delivery. Victoria Jackson, a former *Saturday Night Live* cast member, is cohost of a Web series, *PolitiChicks*, that provides a platform for her political commentary rather than comedy. Jackson is a supporter of the conservative Tea Party movement.

Other Causes

The interconnectivity between Washington, D.C., and Hollywood is well evident during election years (or the White House Correspondents Dinner,

where politicians try to out-do each other by inviting A-list celebrities). Over the last decade or so, however, celebrities have shown a greater willingness to support a social or political cause that they believe in rather than a political campaign. Supporting the wrong political party or candidate can tarnish a star's brand or decrease their fan base. Supporting philanthropic endeavors is a safer endorsement option. By supporting a cause rather than a candidate, celebrities are able to appear with politicians from both sides of the aisle, which gains visibility for the cause without potentially angering fans who may not hold the same political ideology. For example, Jeff Bridges wrote on his Web site prior to the 2012 conventions that he would be attending both the Democratic and Republican conventions to talk to politicians on behalf of No Kid Hungry, a group dedicated to eradicating childhood hunger in America.

Passion and commitment are key to the success of a celebrity endorsement of either a politician or cause, and can successfully leverage the popularity of an actor's fan base and get fans to participate. Lady Gaga, Justin Bieber, Ashton Kutcher, Matt Damon, Britney Spears, and more have used social media to spread the word about causes they support. Celebrities are able to deliver the message of a candidate or a charity to vastly more people through their social media networks, or reach, which results in increased awareness, as well as more donations of money and time. The collaborations between nonprofits and celebrities are mutually beneficial as the actor gets positive publicity and the cause gets validation. In other words, a fan will see a group as legitimate and worth supporting if an actor they trust is involved in the organization.

Many celebrities want to have part of their brand be identified with political and social awareness and activism. Edward Norton cofounded Crowdrise, which is a grassroots donation platform. Crowdrise allows users to tap into their social networks to raise funds for their charitable causes. Celebrities such as Seth Rogen, Danny Devito, and Will Ferrell all use the site. Crowdrise allows users to create a microsite to raise money for a cause. The microsite can be permanent so that a person who is truly committed to the cause can friend-to-friend fund-raise continually. The better a celebrity is at social media, the greater their chances of soliciting

high levels of donations. Actor Ian Somerhader from *The Vampire Diaries* raised \$120,000 in one month for one of his charities. The additional benefit of Crowdrise is that an actor's public profile allows everyone to see what issues matter to them, important for branding efforts.

Malaria No More is another charity that has successfully leveraged celebrity endorsements to promote awareness of an issue that is not perceived to be of high priority by many in the United States. Malaria No More designed a campaign that used well-known comedians. The results ended up on the popular Funny or Die Web site. The campaign resulted in 300,000 Facebook and Twitter supporters and \$750,000 in donations. In 2010, Lady Gaga supported a campaign to repeal the military's "Don't Ask Don't Tell" (DADT) policy. The social media activists asked her followers to visit the Servicemembers Legal Defense Network and within three days over 100,000 people went to the site. Almost all of those were first-time viewers. Her comments on Facebook resulted in over 50,000 "likes." Senate Majority Leader Harry Reid posted comments to Lady Gaga, through his campaign's Twitter account, about the upcoming vote that would repeal DADT. As a result of the exchange, some of Gaga's followers tweeted their support of Reid.

The recent debate over gun control illustrates how one celebrity can work to influence opinion through social media posts. Dean Cain, who played Superman on the TV series *Lois and Clark*, posted a question on Twitter on April 10, 2013, asking his followers if gun control could work. Along with the post, he shared a link to a video that analyzed the effectiveness of Australia's semiautomatic gun control ban. Cain did not engage in a hard-sell approach, but rather let the video inform his followers so they could formulate their own opinion (or at least feel that they have formed their own opinion rather than being manipulated by the choice of video). Conversely, Jim Carrey took a more direct approach on the other side of the same issue by mass tweeting members of the U.S. Senate. Allowing people to come to their own conclusion, especially if it is the conclusion supported by the celebrity, politician, or advertiser, is an important grassroots strategy. Social media further provides validity to an issue by allowing "regular" people to post their own

stories. In the Dean Cain example, followers from Australia posted in support of the video's message that Australia's gun control laws did not work.

Drawbacks

There are downsides to having celebrity endorsements, especially in the age of social media. Social media allows for a message to be posted and reposted, but the creators cannot control the reposting or the editing of certain content. A recent example was Clint Eastwood's address at the 2012 Republican National Convention. Eastwood has a long political career from his support of Richard Nixon in the 1960s to being mayor of Carmel-by-the-Sea, California. During the convention, Eastwood engaged in a 10-minute debate with an empty chair that was used to symbolize Obama. It became a defining moment in the campaign as the meme "Eastwooding" went viral along with the posting of pictures of empty chairs. In just a few days an "Invisible Obama" Twitter account had over 32,000 followers. Even Obama tweeted an image of himself sitting in a chair in the White House accompanied by the line "This seat's taken."

Other celebrities have changed their support for a cause or candidate. Matt Damon, a strong supporter of Obama in 2008, was extremely vocal in his lack of endorsement in 2012. Damon asserted in social and mainstream media that he felt that Obama had not delivered on his promises. Damon, however, is still active in his support of other causes through social media such as the H₂O Africa Foundation. But even the negative social media case studies demonstrate that celebrities get people talking about the politician or cause.

Another potential concern is the trend of celebrities viewing Twitter or Facebook as a revenue stream rather than a transparent form of communication with fans. Currently, there are a handful of celebrities who are willing to be paid to tweet by an advertiser. The level of payment is based on number of followers. For example, Kim Kardashian is paid \$10,000 per tweet to reach her almost 18 million followers, while Tia Mowry commands \$1,275 per tweet for her just over 1 million followers. The sponsored tweets are apparent, but if more celebrities adopt this practice it may impact the appearance of sincerity of any of their tweets.

Conclusion

While the potential for celebrity influence via social media sounds significant, this is still a new area of study and more long-term research needs to be conducted. In the short term, it appears that having a celebrity who is passionate about the cause or candidate can have a positive impact. They are able to keep an issue in front of the public for a longer period of time, that is, change the story's news cycle, and keep the issue on the cultural agenda. If nothing else, they allow for a broader, cross-platform conversation among a global, activist audience.

culture, pro-environment, activist organization founded in 1989 by Kalle Lasn and Bill Schmalz. The AMF has an anti-institutional ideology that focuses on challenging traditional notions of consumerism, and represents itself as an organization for and by activists involved in building resistance against consumer culture. The AMF is especially critical of the advertising industry, claiming that it is the source of many of society's problems, which, the organization argues, are all worsened through excessive and increasing consumerism.

Characterized by some as anticapitalist, the AMF publishes *Adbusters*, a reader-supported, advertising-free, bimonthly magazine with an international circulation of approximately 120,000 people in 60 countries. *Adbusters* features critical views of consumerism and advertising, as well as criticisms of academia and its impact on public policy decisions. In the place of paid advertisements, *Adbusters* features satirical "anti-ads" that often mock traditional advertisements and promote public service and nonprofit

A protester at George W. Bush's second presidential inauguration on January 20, 2005, holds a satirical "Corporate American Flag" created by the Adbusters Media Foundation that features corporate logos in place of stars and is marked "sold."

Adbusters Media Foundation

The Adbusters Media Foundation (AMF) is a Vancouver-based, not-for-profit, anticonsumer

organizations. In 2013 AMF released a book written by Lasn titled *Meme Wars*, offering a harsh critique of the way neoclassical economics is taught and written about.

A key component of the AMF's ideology and practice is the concept of culture jamming, a vehicle used by many anticonsumer culture movements to advocate for less consumerism through civil disobedience and the interruption of traditional media culture. The AMF believes that culture jamming is the key to deconstructing consumer culture as it currently exists. Participants in these activities are called culture jammers. The AMF's approach to culture jamming is largely inspired by situationist theories, which emphasize the reversal of received messages in order to undermine traditional power structures.

Common culture jamming tactics include refiguring logos, fashion statements, and product images; advocating various forms of hacktivism to overcome traditional cyberspace restrictions; and purchasing airtime on major networks to advocate for anticonsumption ideals. In addition, culture jamming sometimes entails transforming mass media to produce ironic or satirical commentary about itself, using the original medium's mode of communication.

Campaigns

The AMF has launched numerous international anticonsumerism campaigns designed to encourage people to decrease their participation in consumer culture. The AMF created and cosponsored events such as "Buy Nothing Day," "Unbrand America," and "TV Turn-Off Week," which the organization believed would help citizens lessen their involvement in excessive consumer consumption. The AMF has also sold Blackspot shoes, which are made in an "antisweatshop" facility in Pakistan.

The most notable of the AMF's campaigns has been Occupy Wall Street. According to the AMF Web site, along with groups such as Occupy Wall Street, USDayOfRage, NYC General Assembly, Take The Square, and Anonymous, the AMF called for

20,000 people [to] flood into lower Manhattan [on September 17, 2011], set up tents, kitchens, peaceful barricades and occupy Wall Street for a few months.

The AMF promoted the Occupy Wall Street protest with a poster featuring a dancer atop Wall Street's iconic charging bull and the AMF staff created the #OCCUPYWALLSTREET hashtag on Twitter. The movement, which has gone global, was started by the AMF, but the group does not control the movement or its participants.

The AMF has received praise as well as criticism for its opposition to consumer culture. Some claim that it represents a cultural revolution and offers inspiration for the changes needed for a more just world, while others argue that the organization is making a commodity out of cultural resistance and lacks the necessary money or power to create any lasting change.

Addiction, Social Media

Social media addiction is an increasingly popular term used to represent heavy use of social networks that interferes with daily life. Many studies

have shown that social media possess addictive qualities similar to drug, alcohol, or chemical addictions. Terms associated with social media withdrawal, similar to those of other addiction withdrawals, include frantically craving, very anxious, extremely antsy, miserable, and jittery.

Excessive usage of social media is only beginning to be examined in a modern, media-laden world as a possible psychiatric disorder and by-product of the cultural adoption of mediated platforms at an increasing rate. The scope and examination of social media addiction is derived from studies that focus on Internet addiction. Other addiction studies relating to pathological gambling and substance dependency also provide a framework for evaluation. A study by the International Center for Media & the Public Agenda (ICMPA) at the University of Maryland concludes that most college students are not just unwilling but functionally unable to be without their media links to the world. "I clearly am addicted, and the dependency is sickening," says one respondent.

Forms

The six different types of social media outlets from which addiction may stem are (1) Wikipedia; (2) blogs and microblogs, such as Twitter; (3) content communities, such as YouTube; (4) social networking sites, such as Facebook; (5) virtual game worlds, such as World of Warcraft; and (6) virtual social worlds, such as Second Life.

Cell phone addiction is identified as a form of social media addiction. With 6.7 billion mobile subscriptions, 1.3 billion smartphones, 2.3 billion users consuming news on mobile devices, and 4 billion users receiving ads on their mobile devices, the mobile segment possesses a 94 percent penetration rate for the planet and significantly adds to the ubiquity of social media access.

Assessment

Although mobile technology may increase social media addiction issues, some scholars say that engaging social media regularly is an activity that benefits children and adolescents by enhancing communication, social connection, and even technical skills.

Questions of whether social media addicts are addicted to the platform of social media or the associated content have become an area of

increasing debate among psychological communities. Scholars identify that social media users become addicted to different aspects of media usage. One of the first studies to assess Facebook addiction was crafted by Cecilie Andreassen of the University of Bergen, Norway. She identified addiction occurring more regularly among younger users than older users. Andreassen also identified that people who are anxious and socially insecure use social media more than others, possibly because those who suffer from social anxiety find it easier to communicate via social media than face to face.

It has also been found that organized and more ambitious individuals tend to be less at risk from social media addiction as they will often use social media as an integral part of work and networking. People scoring high on narcissism tend to be more active on social network sites as those sites provide opportunities to present oneself in a favorable way in line with one's ideal self.

Research that evaluates gender and the usage of social media has indicated that women are more at risk of developing social media addiction, which many scholars believe is a result of the social nature of interacting with the media.

The five-factor model of personality, also known as the Big Five, assesses broad domains or dimensions of personality that are used to describe human personality and has been used as a tool to understand addictive tendencies and their relation to personality type. The model focuses on personality assessment based on five main dimensions: (1) extraversion (being outgoing and talkative), (2) agreeableness (being sympathetic and warm), (3) conscientiousness (being organized and prompt), (4) neuroticism (being nervous and moody), and (5) openness to experience (being creative and intellectually oriented).

Social media addictive tendencies have been reported to be positively related to extraversion and negatively related to conscientiousness. Scholars have reported that extraversion, neuroticism, and openness to experience were all positively associated with frequency of social media use. It has been suggested that extroverts use social media for social enhancement, whereas introverts use it for social compensation, each of which appears to be associated with elevated use. People who score low on conscientiousness are assumed to use social

media as a way of procrastinating; hence, conscientiousness is assumed to be negatively associated with social media use. Neuroticism is assumed to be positively related to use of social media as it may be a way of seeking support. In addition, social media gives people with high scores on neuroticism more time, compared to face-to-face interactions, for contemplation before acting.

Andreassen's Bergen Facebook Addiction Scale is based on six basic criteria, where all items are scored on the following scale: (1) very rarely, (2) rarely, (3) sometimes, (4) often, and (5) very often:

- You spend a lot of time thinking about Facebook or plan use of Facebook.
- You feel an urge to use Facebook more and more.
- You use Facebook in order to forget about personal problems.
- You have tried to cut down on the use of Facebook without success.
- You become restless or troubled if you are prohibited from using Facebook.
- You use Facebook so much that it has had a negative impact on your job or studies.

Andreassen's study shows that scoring of often or very often on at least four of the six items may suggest that a person is addicted to Facebook.

There have been other measures to assess social media addiction, including the Facebook Attitude Scale. This scale has six items for assessing attitudes toward Facebook. Each item is rated on a 5-point scale with anchors of 1 (strongly disagree) and 5 (strongly agree). Higher scores then reflect positive attitudes toward Facebook, according to N. B. Ellison and colleagues.

The Online Sociability Scale is comprised of five items, each pertaining to frequencies of different uses of Facebook, such as comments on photographs or sending private messages. Scores are rated on a 9-point scale using the anchors of 1 (less than once per year) and 9 (more than once daily). Higher ratings reflect high frequency of Facebook use.

The Addictive Tendencies Scale has three items representing salience to, loss of control of, and withdrawal from Facebook usage. Each item

is rated on a 7-point scale with anchors of 1 (strongly disagree) and 7 (strongly agree). High ratings indicate high addictive tendencies.

The NEO-Five Factor Inventory is a short, 60-item version of the NEO Personality Inventory-Revised, which provides a brief, comprehensive measure of the domains of the five-factor model of personality: neuroticism, extraversion, openness, agreeableness, and conscientiousness.

The BIS-BAS scales assess behavioral inhibition using seven items. Focus is on measuring predisposition to avoid threatening or punishing stimuli. The BAS scale of 13 items assesses predisposition to approach appetitive stimuli.

Conclusion

Overall, the swell of social media prominence and its associated addictive qualities is an area of increased investigation from academic, corporate, and technological orientation. As media increases bandwidth, cell phone networks continue to stream faster data, and device capacity increases, the end user is interacting with more complex information becoming traded on social media spaces. This exchange of information continues to situate technology and the end user in an increasingly complex relationship, with addictive tendencies seemingly on the rise.

Advertising and Marketing

Increasingly social media is the first thing that people check when they wake up in the morning and the last thing that they check before they go to bed. Staying connected via smartphone or tablet (the PC is rapidly being replaced globally as the device of choice for accessing the Internet) is not restricted to teenagers or young adults, although they are still the heaviest users of social media. Worldwide, one out of seven people had a Facebook page in 2013 (approximately 1 billion people or more than three times the population of the United States, with 680 million of those being mobile users), and close to four out of five people visit social networks or blogs on a regular basis. Twitter doubled its user base in the last six months of 2012 and has surpassed 200 million active users. YouTube has 4 billion views per day with 72 hours of content being uploaded every minute, and Flickr provides users access to over 8 billion photographs. While these numbers are impressive, the figures will continue to increase as consumers turn more to second screen (mobile) devices to not only stay connected through social media, but also to watch and discuss the majority of their entertainment and news programming. As the eyes of consumers turn more and more to social media, companies look increasingly to social media as a key platform for delivering advertising messages.

By 2017, it is predicted that social ad spending will rise to \$11 billion, up from \$4.7 billion in 2012. The importance of such high connectivity for social media advertising and marketing is magnified, because social media sites are able to collect tremendous amounts of both demographic (age, sex, race, income) and psychographic (values, beliefs, desires, consumption patterns) data. Such market research is referred to as “netnography.” In spite of these values, companies have been slow to incorporate social media into their advertising mix. This is due in part to a lack of clear understanding regarding how social media fits into a traditional integrated marketing communication (ICM) plan, as well as an inability to effectively measure the metrics that demonstrate a return on investment. In spite of the concerns,

advertising through social media can offer companies unique opportunities to engage with their customers through open communication, collaborative information creation, and rapid feedback. Also, social media advertising has shown promise as a way to influence product awareness, opinions and attitudes, information seeking, purchasing, and postpurchase discussion. This is the case even if—perhaps, especially if—the “product” being marketed is a political candidate, an advocacy agenda, or a particular ideological stance on a salient social issue. These benefits of social media advertising will become clearer as social networking sites continue to refine their advertising and marketing platforms.

According to a Vizu study in October 2012, 75 percent of advertisers are using social media, shifting budgets from offline to online to do so, as they recognize the need to create advertising campaigns for both traditional and social media. Social media marketing (SMM) involves both paid and unpaid practices. Unpaid platforms can be corporate Facebook pages, blogs, YouTube channels, or Twitter accounts. These are all clearly identified as being created and maintained by a corporate entity, as transparency is very important in social media advertising. Paid platforms involve ads on any of the above sites or the sponsorship of blogs. The paid portion of social media efforts are a relatively small percentage of advertising budgets, with 70 percent of advertisers only spending between 1 and 10 percent of their budgets on social media. It is anticipated that this percentage will continue to rise, as over 64 percent of companies plan to increase their social media advertising spending in 2013.

By 2017 social media advertising may account for almost 20 percent of a company’s total advertising budget. Of the money being spent, over 50 percent of advertising dollars are going to Facebook ads, with Twitter and YouTube a distant second with 13 percent. But SSM spending is not consistent worldwide. North America dominates social media advertising spending, accounting for almost half of all ads globally. Western Europe and Asia each spend approximately one-fourth of all global social media advertising dollars, while the Middle East and Africa combined account for less than 1 percent. These figures do not match with social media and Internet use as the United

States ranks fourth in social media use behind Indonesia, Argentina, and Russia.

The primary area for paid advertising on social media is through what is known as native advertising. Native ads are ones that are extremely relevant, that is, targeted to specific users and embedded within news streams on Facebook, Twitter, or LinkedIn. Native ads could involve video or interactive content, but the goal of native advertising is to find commonalities between target audiences and advertising to bring the two together. This is where social media excels, as individuals seek out social media sites or groups that match their own interests. The search for commonality can lead to the creation of brand communities where consumers gain information, share ideas, play games, and more. Advertisers need to find, or occasionally create, such sites to reach their target audience(s). Such targeting is engaging, relevant, and fosters word-of-mouth or viral spread of the advertising message. Social media sites have been creating multiple ways to assist companies in the distribution of native advertising and the formation of brand communities, as can be seen in the sampling of techniques and platforms that follow.

Google

One of the earliest advertising services on the Internet was Google AdWords, which launched in October 2000. Through AdWords a business creates an ad and then identifies key words related to the business. Whenever a potential customer performs a Google search using one of the key words, the business' ad might appear. The system worked on a pay-per-click basis (also known as cost per impression or CPM): companies were only charged if someone clicked on the ad that directed them to the advertiser's Web site, and prices per click were relatively low, with many at \$0.25.

In 2002, AdWords was switched to an auction model where companies have to bid in order to receive key placement and a greater chance of their ad being shown. This has resulted in significant price increases, with some searches costing \$100 per click in order to receive the highest placement on Google. Placement does matter, as advertisements in the top positions receive 10 times as many clicks as ads that are in side locations. While Google AdWords is very profitable for Google, and 2012 revenue increased 35 percent to \$12.21

billion (97 percent of that revenue is from advertising), return on investment for the companies placing the advertisements has decreased due to increased cost. However, businesses still see profitability, as there is an average \$2 return for every \$1 spent through Google AdWords.

Facebook

Facebook, a company that posted \$305 million in advertising revenue in 2012, is constantly updating and expanding its tools for advertisers. In July 2012, the company launched page post targeting enhanced, which allows organizations to target their page posts based on key demographic and psychographic information such as "likes," gender, relationship status, and more. This then helps

Industry representatives gathered in Facebook's booth at ad:tech London, an event for online marketing and advertising specialists in September 2010. By 2012 Facebook's advertising revenues had exceeded \$300 million.

to drive traffic to a company's Web site by collecting user information on the Facebook domain based on the clicking of the "like" button. This was followed in August by Pages You May Like, paid-for sponsored stories, and Sponsored Results, ads that display near searches as well as more refined ad targeting techniques. Facebook's tools are not limited to large companies. Page Like Ads are designed to assist small businesses in creating ads for either the mobile or desktop platforms.

More recently, Facebook added Partner Categories to track user data across the Web as well as outside the Web. Previously, advertisers only had access to data in a person's Facebook profile. With the Custom Audience feature, advertisers receive not only Facebook profile information, but also offline information such as purchase history, job category, and lifestyle. While there are many privacy concerns with such tactics, as will be discussed later, Partner Categories do not share information about one specific Facebook user. Rather, they create categories that show advertisers the number of users who fall into them, such as dog owners. If that is a category that a company's advertisement appeals to, then the Power Editor tool will allow a target message to be driven to those Facebook users. All of these advertising features, as well as a tool to set the advertising budget, are easily accessed through the Ads Manager button on a company's Facebook page. Advertisements on Facebook must be kept simple, as the ad headline can be no more than 25 characters and the text is only 90 characters. An ad may feature an image, but that image will then be the thumbnail everyone sees on the company's Facebook page.

Twitter

Twitter began to refine its advertising options in 2010 with Promoted Tweets, Promoted Trends, and Promoted Accounts. These types of promoted advertisements are clearly labeled as such, but can be targeted to relevant users and thus appear in their timeline. Users can click on the tweet, trend, or account for more information or they can dismiss the information out of their timelines. However, users cannot opt out of receiving future promoted items. Prices for Promoted Trends are \$200,000 a day, and Twitter recommends a cost-per-click bid of at least \$0.50 for Promoted Tweets, but in order to receive a higher placement

rate the recommendation is \$1.50. Companies that want to increase their chances of having their tweets appear can bid more. In addition, companies can pay a recommended \$2.50 per new follower to have their company included in the "Who to Follow" box on the Twitter home page. Facebook also allows companies to push coupons or promotions to potential customers through Facebook Offers. Offers can be shared with other users and will appear in a user's timeline.

In February 2013, Twitter bought Bluefin Labs, a company that captures social media analytics, which resulted in the launch of Twitter TV Ad Targeting. This service allows television advertising campaigns to be synced to Twitter ad campaigns. The service tracks when an ad runs on television and then who tweets about the show. While there is no guarantee that a tweet about a TV show means that a person saw the ad, it does indicate a higher level of engagement. Companies can build in interactivity, and there is an increased possibility of consumer-to-consumer communication. The goal of all of Twitter's advertising platforms is to help businesses target individuals who will more likely become customers, and conversion rates can occur for as little as \$0.60. The strategy appears to be working. In just two years of offering paid advertising, Twitter's advertising revenue grew 213 percent to \$139.5 million in 2011 and \$288 million in 2012.

Another trend for advertising on Twitter makes use of the high number of people who follow tweets by celebrities. Fans like to feel that they really know their favorite celebrity and posts on social media allow this to occur (although many posts are made by public relations firms rather than the celebrities themselves). Companies are beginning to pay celebrities to tweet about their product or service. For example, Kim Kardashian is paid \$10,000 for a sponsored tweet to reach her over 17 million followers. Charlie Sheen joined Twitter and quickly was paid \$9,500 to tweet about internships.com. The site received over 95,000 clicks in one hour. Such sponsored tweets are akin to having paid celebrity endorsers, but it is not always clear to readers that the tweets are being sponsored.

YouTube

YouTube also has a booming advertising business, showing in 2012 a 60 percent increase in

revenue over 2011. Advertisers paid over \$4 billion to YouTube; this will likely increase because of new revenue-sharing programs. The new programs eliminate the need for content creators to seek YouTube's permission to pair their videos with a sponsor. There is now a simple "monetize" button that permits content creators to connect with a monetizing partner almost seamlessly—although some users do report glitches, delays, and even interruptions in monetizing through the "green button" function. Content creators keep roughly half of all of the revenue. Ads can occur before the video or on the home page. YouTube's Ads Leaderboard allows possible advertising creators an opportunity to view which ads are currently the most popular. YouTube's advertising processes are tied to Google's AdWords through TrueView suite.

Integrated Marketing Communication

Regardless of which social media platform(s) a company selects to advertise on, the advertising messages must be part of the company's overall marketing plan (IMC). Integrated marketing communication is a process in which companies create a coordinated plan across all aspects of the marketing mix in an attempt to control and unify the messages distributed to consumers about an organization's objectives or goals. Traditional IMC plans rely on managers to carefully control what is being said and how it is being said. Since social media is heavily consumer-generated, companies lose part of that control. That does not mean, however, that social media cannot be incorporated into an IMC plan.

Companies need to recognize the unique nature of social media in order to utilize it effectively. For example, companies need to talk to, not at, consumers, as well as listen to what the consumers are saying. Hard or direct sell tactics are not the most effective in social media ads. This is due, in part, to the multiple communication channels seen in social media: company to customers, customers to company, and customer to customer. While this does shift the balance of power toward the consumer, social media-savvy companies realize that this is the new landscape consumers operate in. Consumers trust social media sites for providing unbiased information, although this may not be a correct assumption, and turn to them more

frequently when they are seeking out information on a company or product.

A company's social media sites should become the primary place that consumers go to seek out information. Because companies cannot control all of what is being said about them in social media, they do need to monitor on a regular basis what is being said about their products or services. The comments, if positive, can be used to help promote the company through sharing the posts across social media platforms or to implement a predetermined communication plan to deal with negative posts. All companies need to have social media policies and plans in place.

Another drawback to social media marketing is a lack of effective metrics to measure success of advertisements. Therefore, many companies utilize social media primarily as a way to build brand image and awareness, which is measured using pins, "likes," views, click-throughs, shares, and retweets. Advertisers would prefer to find a way to assess brand lift and sales through social media marketing. Without an effective way to gather this data, greater use of social media as an advertising platform will continue to be limited. Many companies are working to develop effective metrics, and a beta test by Twitter of one such metric demonstrated that promoted tweets had a 22-percent higher message association.

The potential downsides of social media advertising do not outweigh the potential benefits. Companies who use their social media walls to push their advertising messages witness strong conversion rates, clicks that result in sales, sign-ups, time on-site, or other tangible activities. Unpaid social media ads can also result in strong referral traffic such as sending potential customers to company-sponsored blogs. Regardless of what a company uses, either paid or unpaid, it is important to use social media as a way to help customers as much as possible. As with traditional advertising, social media ads need to show how a company or product can solve a problem that a customer is facing. If a company can convince that targeted individual that their product will most successfully correct the problem, then a sale can occur. In social media, however, such successful problem solving can go viral and be spread to thousands, if not millions, of other people. It is word of mouth on a digital, global scale. In addition, social media benefits

from the fact that all posts, whether advertising or not, appear organic and thus, people are willing to share those posts with others, especially if they involve a good success story.

There are many other strategies for how to effectively use social media marketing as part of an IMC plan. Experts consistently reference social media's ability to easily track consumer preferences through what they "like" or follow. Companies can use this information to seek out the sites that bring customers together based on common interests related to a company's core business. These sites provide engaged potential customers that should be more receptive to related advertising messages, whether sponsorship of a site or a banner ad. Shared interest also allows for feedback that the company can use to improve its messages or the products themselves. In addition, allowing consumers to share what they are "liking" throughout their entire social media presence makes consumers feel like they are part of the process (or dialogue), while also becoming another form of unpaid advertising.

Customer Participation

Research has shown that social media advertisements that encourage some level of customer participation or interaction are also effective. Examples include loyalty programs, online voting (especially for social causes to receive funding), or gaming. Games may not appear to be an ad, but if created properly they can be an effective way to promote a product. Movie companies have embraced this form of online advertising. These examples tie into the need for companies to think outside the box of what an advertisement should look like, as well as a willingness to be a bit outrageous in the creative content of an ad. For example, Dove's "Evolution" campaign featured a short video that exposed the make-up and Photoshop tricks used to make models appear more conventionally beautiful. The video was designed to encourage discussion about distorted body image and issues of self-esteem. The video was viewed over 44,000 times the first day and 12 million times within the first year. The bigger benefit for Dove is the estimated \$150 million of free advertising the campaign created due to viral spreading of the video that resulted in mainstream media discussion of the ad.

Other Issues

It is important to note that there are other issues that companies need to be aware of when they are creating a social media marketing plan. Many of these are legal issues that relate to privacy. Over the last few years, there have been increasing numbers of lawsuits aimed at clarifying the relationship between the types of information that social media sites gather about their users and what they can provide to advertisers. Learning such personal information is key to the ability to use social media to effectively target the consumers advertisers are trying to reach, but is this a violation of user privacy?

California now requires that all apps (either on the Apple App Store or the Android Store) have a privacy policy that is available to consumers prior to downloading an app. Other states and Congress are currently looking into privacy issues and more regulation will be likely in the future. Regulation regarding collecting personal data from children has already changed as a result of an amended Children's Online Privacy Protection Act (COPPA) of December 19, 2012, by the Federal Trade Commission that seeks to limit the information a company can collect and share about children under the age of 13 without parental consent.

Conclusion

Regardless of how social media is used as an advertising tool, businesses need to keep in mind that some aspects of good advertising do not change. First, companies need to clearly define the objects that they wish to achieve through social media. Advertising is driven by assessment and accountability. Companies need to know that they are receiving return on investment as well as meeting all of an IMC plan's goals. Clearly defined outcomes will help a business to carefully select the marketing channels that best fit their corporate message, since there are too many social networking sites to utilize them all for each campaign. Companies need to pick the ones that best match with the marketing objective. Regardless of which traditional or social media platforms they select, all advertising messages must be kept consistent and straightforward. Effective social media marketing campaigns should be simple, show a product's advantage of price and quality over the

competitors, contain an engaging or fun advertising message, and clearly convey the unique selling proposition of the product or service.

Advocacy Groups, Political Branding of

Advocacy groups, or interest groups, are specific actors that undertake a systematic effort to further or achieve specific policy goals, to some extent, through the influence on public opinion; therefore, their impact in the development of political, economic, and social systems is undoubted. Advocacy groups might include nongovernmental

organizations (NGOs), lobby organizations, pressure groups, activist groups, or social movement organizations. Advocacy groups may differ by size and objectives—either long-term impact or short-term response to the issue in focus. The range of issues addressed by various advocacy groups covers issues addressed by local, state, and federal governments, as well as issues that are not addressed by government, but are of interest to a specific community. This range can cover labor, civil rights, democracy, education, health care, the environment, commerce, religion, or the justice system. Motives may vary from political and religious to commercial spheres. Methods used by groups for advocacy activities include lobbying, media campaigns, publicity stunts, polls, research, and policy briefings. Some groups are supported by powerful business or political interests and exert considerable influence on the political process; others have few such resources.

Some groups have developed into important political institutions or social movements. Powerful lobby groups are sometimes argued to be manipulating the democratic system for commercial gains; therefore, lobbying activities have become strictly regulated in some countries as a result. Advocacy groups with less financial resources may use direct action, protests, and riots as a form of civil disobedience; therefore, in some countries they are accused of being a threat to the social order as "extremists."

Advocacy groups can initiate policy changes through various channels apart from government or the political structure, such as media messages along with public opinion campaigning. Groups will generally use two distinct styles when attempting to manipulate the media—they will either put across their outsider status and use their inability to access the other channels of influence to gain sympathy, or they may put across a more ideological agenda. Examples of such groups were the trade unions that would campaign in the form of industrial action and marches for workers' rights, gaining much media attention and sympathy for their cause. The activities of advocacy groups with less or no financial resources for campaigning are especially interesting with respect to assessing opportunities for the use of social media to facilitate civic engagement and collective action.

Social Media and Political Branding

The whole idea of “branding” products, services, or ideas is about communication with a target group. Advocacy groups, especially those formalized as NGOs or lobby organizations, aim to address policy issues, and therefore may need to interact with their target communities through a political brand.

The use of social media is a feature of political and civic engagement for millions of people around the world. The survey conducted by the Pew Research Center’s Internet and American Life Project in the United States in 2012 discovered that around 60 percent of American adults use social networking sites like Facebook or Twitter, and that 66 percent of those social media users—which is about 40 percent of all adults in the United States—have done at least one of eight civic or political activities with social media. The following figures from this study also support the statement that political branding of advocacy groups through social media is essential nowadays: 38 percent of those who use social networking sites or Twitter use those social media to “like” or promote material related to politics or social issues that others have posted; 34 percent of social media users have used the tools to post their own thoughts or comments on political and social issues. Also, 21 percent of those who use social networking sites or Twitter belong to a group on a social networking site that is involved in political or social issues, or that is working to advance a cause. There are no major differences by ideology or partisanship when it comes to using social media this way. About 31 percent of social media users have used site tools to encourage other people to take action on a political or social issue that is important to them.

Advocacy Groups and Social Media Use

Advocacy groups are using the Internet to accomplish organizational goals, and have been doing so for more than 10 years. It has been suggested that the Internet has had a positive impact on the activities of social movement organizations by increasing the speed, reach, and effectiveness of communication and mobilization efforts. Assessing the extent to which social media can facilitate civic engagement and collective action requires a broader and deeper understanding of how social

media are being used and perceived by groups who strive to accomplish certain goals.

A study on the use of various social media engines by advocacy groups was conducted in 2012. According to its outcomes, advocacy groups of different political and ideological orientations operating in the United States are using social media to interact with citizens every day. A survey of 169 representatives from 53 national advocacy/activist groups operating in the United States assessed the extent to which these groups perceive and use social media as tools for facilitating civic engagement and collective action. To assess how members of advocacy groups perceive social media as tools that can facilitate civic engagement and collective action, social media/communication directors were asked to rank five social media technologies (Facebook, Twitter, YouTube, blogs, and e-mail discussion lists) in terms of their effectiveness in facilitating various advocacy-related tasks.

Quantitative results reveal that all groups are using a variety of social media technologies to communicate with citizens almost every day. Facebook received the strongest scores overall, with Twitter and e-mail discussion lists often being noted as other strong options. YouTube was overwhelmingly regarded as the worst or among the worst in most cases. Among the larger groups, other applications being used include Flickr, Tumblr, Foursquare, Identi.ca, Picasa, and Vimeo. Medium-sized groups reported that they use Vimeo as well as Jumo, Diigo, and Constant Contact. Of the small groups, some use Flickr and also Joomla, JamSocial, Myspace, and Atheist Nexus, a social media site for the Atheist community.

Qualitative results suggest that groups believe that social media can facilitate civic engagement and collective action by strengthening outreach efforts, enabling engaging feedback loops, increasing speed of communication, and by being cost-effective. As noted in the study,

... while some groups raised doubts about social media’s ability to overcome the limitations of weak ties and generational gaps, an overwhelming majority of groups see social media as essential to contemporary advocacy work, and laud its democratizing function.

Individual Engagement

Social media provide considerable impact on initiating and proceeding with the political communication campaigns that engage individuals with advocacy activities. The branding of political messages is a powerful networking tool. Moreover, branded political communication helps activists gain access to the mass media on terms far more favorable to activist messages than if those messages were packaged in more conventional ideological terms.

Activist networks using branded communication strategies can sustain long-term political initiatives even in the absence of the strong central coordination and the organizational resources that seem to be required for success in more conventional advocacy politics. At the same time, there may be political disadvantages in loosely networked consumer activist campaigns that lack the decision-making capacity and strategic coherence of more conventional campaigns run by NGO advocacy organizations.

Individuals disconnected from traditional social and political institutions can therefore join advocacy campaigns through social media. For increasing numbers of citizens—especially younger generations—politics in conventional (collective, government-centered, electoral) forms has become less salient.

The campaign as a permanent basis of political organization can be traced directly to the changing social conditions of globalizing societies and their weakened group, party, and ideological bases of political organization and mobilization. Campaigns in such social contexts thus serve more than just the purpose of communicating political messages and achieving political goals. They also become mobilizing and organizing devices in contexts that lack more fundamental organizing mechanisms such as strong parties, formal interest groups, or ideologically defined social movements.

The Internet in general and social media in particular are actively used in global activism for reasons far beyond reducing the costs of communication. The Internet uniquely facilitates the loosely structured networks and affinity ties of this brand of late modern politics. Electronically driven stories contain the potential to scandalize a campaign target with a blitz of electronic information

that rises from an activist information chain to more general Web sites (blogs and social networking sites), and then appears in the mainstream press that monitors and may even own such Web sites. Many news stories may first appear in social media as catchy phrases and anecdotes that take on a life of their own when thousands and even millions of networked citizens hit their send or forward keys.

The place of the Internet and social media in the structure of global issue activism activities is rather central with respect to the relations among different players. Some authors argue that the importance of social media as a means of mobilizing action increases with such characteristics of the social movement as the number of actors and organizations in a network, the diversity of issues and goals, the geographical reach, or the length of run time for a campaign. Another prediction is that the stability, effectiveness, and strength of member identification with complex (multi-issue, multi-goal) campaigns increase with the emergence of network coordinating hub organizations that use e-mail and Web news to keep dynamic networks in communication over time.

Another angle of using social media by advocacy groups and activists is that the alternative movement opposed to branded products or companies can become strong and influential in social media. Some multinational companies have been developing their brand histories for decades; therefore, to confront them advocacy groups may need to create alternative branded campaigns, especially when arguing about particular policy changes.

One of the recent studies of the social media effect in advocacy campaigns and global activism analyzed a case involving Nike in which one activist network was aiming to pressure the multinational company to join standards monitoring systems. The advocacy group and activists did that independently of government brokering. The case reflects the perception of many activists that international labor standards regimes have largely slipped past governmental regulation and that organizations such as the International Labor Organization are ineffective advocates. As a result, many sweatshop activists seek to create labor standards monitoring systems that must be sustained and enforced through consumer

pressure. Combining the low cost and global reach of social media with the public salience of logo campaigns (that might begin on the Internet and spread out in the mass media), sustainable activist networks have developed successful political strategies based on targeting companies and their brands.

Africa, North

The 21st century has seen social media in north Africa play an important role in politics. Various social media platforms have been used for political organizing and outreach, have been co-opted by mainstream media and citizen journalists alike, have allowed a means to circumvent government censorship, and provided people a place to debate issues of social importance. The use of social media in politics in the region has blurred national borders and to a large degree torn down political information silos.

Political Outreach and Organizing

Political movements, parties, politicians, and activists use social media to reach beyond those who already support their cause or party and seek to further gain support. Social media have been useful tools for political outreach in north Africa, with political messages reaching populations that were not particularly politically active and drawing those people into political activism. For example, in Egypt, young people were galvanized to move into the streets to protest in 2011 because calls to action were heard through Facebook and through the messages of popular bloggers.

In Algeria, particularly in the south of the country, organization of youth activism around issues of social and economic justice have been enabled in part by the use of social media. Protests in several cities in March 2013 demanding a more equitable distribution of wealth in Algerian society received wide coverage on social media. Part of political organizing is mobilizing supporters. In Libya, when activists and those fighting the revolution in 2011 were running from the Libyan army or had no access to state controlled media, they took to using social media platforms as one method for reaching their supporters to inform and mobilize them into action.

The most obvious demonstration of social media's importance in politics in north Africa can be seen in the popular uprisings that took place in Tunisia, Egypt, and Libya. While the precise importance of social media's roles in those uprisings is still being debated, it is clear that social networking sites like Facebook and Twitter were used as means for citizens to speak out and as a vehicle to gather in virtual space. These gatherings in virtual space often translated to political gatherings in physical space, like in Tahrir Square in Cairo, the site of the most visible symbol of the Egyptian revolution.

Politicians in north Africa, particularly after the revolutions in that region, recognize the importance of social media in communicating their political messages. The Egyptian military began to use Facebook to communicate with Egyptian citizens after the uprisings and the fall of President Hosni Mubarak, clearly indicating they recognized the utility of that social media in political outreach.

Social media play an important role in north African politics during elections. For example, in both rounds of the 2012 presidential election

Thousands of people fill Tahrir Square in Cairo, Egypt, on July 29, 2011, during a protest called the "Friday of Unity." Social media, including not only Facebook but also YouTube video and Flickr pictures taken from within crowds like this one, are thought to have encouraged even more Egyptians to join their fellow citizens in publicly protesting years of authoritarian rule during the Arab Spring.

cycle in Egypt to elect the first post-Mubarak leader of Egypt, candidates and political parties had a social media presence, having learned the efficacy of communicating through social media with supporters, the general public, and mainstream media from the experiences of the revolution. Both Mohamed Morsi and Ahmed Shafik, the two Egyptian run-off presidential candidates in the May 2012 elections, maintained a presence on Facebook. Smaller parties in the 2011 Tunisian election cycle used Facebook to recruit supporters and train poll station observers. In an Associated Press interview, Tunisian election observer University of Washington Professor Philip Howard noted that female candidates in that election seemed particularly inclined to use Facebook.

Not only do politicians and political parties use social media in north Africa for organizing and outreach, but so do citizen activists. For example, a young Egyptian female online activist,

Dalia Ziada, has used blogging to organize both online and street protests over several years during Egypt's transition from authoritarian rule to a new regime.

Citizen Journalism

It is through social media in north Africa that major political events are being written about, recorded, and filmed in real time by ordinary people acting as citizen journalists as those political events unfold. Twitter feeds from the revolution in Libya, Facebook posts in Tunisia, YouTube videos uploaded and blogs written in Egypt are all stories from a citizen's perspective, often appearing as the events take place or very soon thereafter. It is hard for a government and its political leaders to deny a story that is politically damaging when there are people's own experiences of that event online for citizens and people around the globe to see, read, and hear.

Social media coverage by citizen journalists of major political events that include visual images often strike the strongest political chord with audiences. YouTube video and Flickr pictures from within the crowds at Egypt's Tahrir Square encouraged people to come out onto the streets in protest and join their fellow citizens in showing their anger and frustration with years of authoritarian rule. Facebook and other social media images of street vendor Mohamed Bouazizi's self-immolation in Tunisia in protest of the confiscation of his goods by municipal authorities brought Tunisians onto the streets in angry protest.

Whether it was witnessing other citizens' political actions in the Egyptian revolution, or seeing a graphic demonstration of the results of government agents' disregard for an ordinary man in Tunisia, social media serve as a galvanizing political force when used by citizens to document their own or others' experiences.

Social media platforms like Twitter and Facebook have also been used by citizens to document important political occasions or milestones. During the Egyptian elections in May 2012, for example, citizens were using social networks to document their voting experiences. People posted pictures to Facebook of voting, of waiting in lines to vote, and even of the ballots. They tweeted accounts of the day on Twitter, enabling records of that historic event to be captured for themselves, their friends, and followers. This personalizing of political discourse and experience in north Africa is made possible by the capabilities of these social media.

Censorship

Due to state control and censorship in the north African region, social media capabilities allow for citizens and opposition groups to find ways to communicate political messages through mediated channels that are not blocked. Many governments in the region do not have good records of respecting media freedom. In their 2013 ranking, Reporters Without Borders ranked north African countries like Morocco, Libya, Tunisia, Egypt, and Algeria with relatively low scores in respect to media freedom. Social media provide a platform for voices to be heard who have no other media outlet or limited media choices.

One example of the use of social media to get around government censorship efforts was seen in Libya in January 2011. In the wake of the Tunisian uprising and some riots in Libya sparked by housing concerns, Libyan opposition Web sites were hacked (as many political scholars and media professionals suggest, by Libyan government agents) so that their sites had pro-Muammar Qadhafi messages in place of their regular content or had been taken offline. In response to this censorship, opposition groups switched to social media platforms like Facebook until they could get their Web sites up and running again. This allowed them to be in contact with their supporters who had access to those social media and get around the censorship efforts of the Libyan regime.

Another example that demonstrates north African government recognition of the importance of social media can be seen in the Egyptian government's attempt to block access to the Internet in January 2011. This censorship was a crude attempt to silence multiple avenues for dissenting voices to protest and organize on social media.

Mainstream Media's Use of Social Media

Mainstream media, both within north African countries, as well as internationally, make use of politically important news about north African politics found on social media. This use may sometimes be to supplement the professional reporting gathered by a mainstream source, but is also sometimes used as primary reporting material.

One example of this mainstream media use can be seen in footage of the Libyan revolution unfolding in the streets shown by Al Jazeera television provided by social media sources. Citizens took the video footage on their cell phones and then posted that video to social media sites. During the Libyan revolution, activists like Danya Bashir used Twitter to provide journalists, especially journalists outside of Libya, information about what was taking place around them, so that information could be reported internationally. This was a deliberate strategy of using social media to connect with mainstream media.

Mainstream media use social media as political news dissemination channels in north Africa as well. For example, international news organizations like CNN and Al Jazeera used Twitter in the coverage of the Egyptian revolution, and their

tweets were influential. Their tweeted reports on the Day of Rage protests in Cairo, the limiting of Internet access by the Egyptian government, or the resignation of President Mubarak influenced what was trending on Twitter.

Forum for Debate

Social media play a critical role in politics in north Africa as they provide citizens with a mediated forum for discussion and debate about issues of importance in their societies. It is important to note that political discourse often takes place on social media before, during, and in the aftermath of important political events.

For example, political discussion on blogs was taking place before the revolutions in Tunisia and Egypt on topics of concern like liberty and democracy. Through discussion on social media, citizens who were opposed to the leadership in their countries were able to discuss what concrete goals should be achieved in order to bring about political change.

Blurring National Boundaries

Social media enable political messages and discourse to cross geographical and national boundaries in north Africa. This development allows people in the whole region to see how political groups organize, to hear their messages, to gauge the effectiveness of political strategies, and to anticipate governmental responses to political movements.

Researcher and communication professor Philip Howard of the University of Washington and his team analyzed over 3 million tweets, YouTube content, and blog posts and concluded that discussion on social media played a role that was central to shaping political debates in the revolutions across north Africa. As Howard states,

Our evidence suggests that social media carried a cascade of messages about freedom and democracy across north Africa and the Middle East, and helped raise expectations for the success of political uprising.

Limitations of Social Media

While social media play an important role in politics in north Africa, it is important to realize that there are limitations to social media's

impact. First, social media exist in conjunction with mainstream media, and do not serve all the functions nor have all the conventions of the mainstream press. For example, journalists are trained, and taught how to tell stories and report on situations objectively, something that is not expected of a person in the midst of a protest in Morocco or fighting in Libya.

Second, the populations in north Africa have social, political, and economic grievances and concerns about governance that stretch back decades, and so the power of social media in changing governments through revolution, or changing long-standing political patterns should not be overstated. Third, social media enhance rather than replace more traditional forms of political organization in north Africa like door-to-door campaigns, radio and television advertising, and speeches at political rallies.

Africa, Sub-Saharan

The objectives of disseminating knowledge, ideas, and news and the sharing of common feelings, concerns, and thoughts with large groups are as old as human existence's dependence on collective aspirations and efforts. In view of the industrialized nations' leading role in advancing the technological and sociopolitical infrastructures of communication and interaction, sub-Saharan Africa's participation in this global new medium has been greatly undervalued or outright dismissed as inconsequential. But understanding the transformation in the context of the realities of the region is vital to developing a fuller appreciation of a global phenomenon.

Background

Sub-Saharan Africa has lagged behind the world in its industrial and technological developments in the modern era. The continent's limited access to electricity, technology, and software, combined with poverty and restrictions to freedom of expression and free flow of information, have been given as explanations for its lack of vigorous social media. Yet, many traits such as low level of economic development and technological advancement, and persistence of political and social structures of authoritarian governance, are shared by other regions. While the drawbacks of limited institutional and social barriers have some validity in constraining social media, the overall determination of the people coupled with alternative ways of communication and organization leave a great deal of room for the viable development of social media. Social media may be a new means of laying the foundation of information exchange and shared learning that could lead to building freer and more prosperous socio-political communities.

As of mid-2012, only around 15 percent of Africa's population had access to the Internet. However, this statistic hides an underlying reality in which social media is playing a significant role in influencing politics on the continent. Mobile phone subscription in the region, estimated to be as high as 750 million, is believed to provide access to information and communication for individuals, movements, and institutions, proving in many cases to be a crucial component in

improving political stability and security, as well as contributing to a growing sense of government as being accountable to the governed, as indicated by citizen satisfaction measurements. As in much of the world, patterns of voting, governance, and monitoring the works of public servants have been reshaped to demand ethos of transparency, accountability, and pluralism in politics. Government leaders, civic groups, and movements for change in Nigeria, South Africa, Zambia, Sudan, Côte d'Ivoire, Senegal, Uganda, and many other countries in the region have been forced to alter their platforms and political behavior patterns in line with international calls for high standards of democratic rules. Internet access, Facebook, Twitter, Flickr, LinkedIn, and countless venues of information currently avail themselves to the hopes and aspirations of Africa's youth eager to play important roles in their nation's futures. Public servants such as the national leaders in Nigeria, Kenya, South Africa, and Rwanda joined international trends of having open lines of communications with hundreds of thousands of their people following their ideas on Facebook and Twitter.

Adapting the Medium

Clearly, Africa's less developed socioeconomic and political structures have not offered ideal conditions for the use of social media to realize accelerated transformations. The creative adaptation of information technology to sub-Saharan Africa's realities has brought about significant changes for the region. Innovative approaches to overcoming the challenges include using mobile technology to compensate for the high costs and limited availability of computers.

A major factor in the relative narrowing of the gap has been the sharp rise in access to mobile services. In contrast to fixed landlines, over 60 percent of people in Africa are estimated to use mobile phones. Mobile broadband services requiring less electricity and technical know-how have consequently been introduced to the region, offering opportunities for easier and more user-friendly access to populations that might not have adequate literacy.

Through the spread of mobile telephony that provides connections to the Internet, growing numbers of Africans have been able to take advantage of both local and global social media for gaining

While only about 15 percent of Africa's population had access to the Internet in mid-2012, over 60 percent of people in Africa are estimated to use mobile phones. These Kenyan students played a game on a smartphone in August 2012.

access to information and communicating their ideas. Pay-as-you-go airtime models and inexpensive handsets have also widened mobile phone use. These practical applications of information communication technologies (ICTs) in addressing the continent's unique conditions have led to greater qualitative use of social media despite limited technological and economic structures.

The suspension of mobile communication is believed to have been instrumental in the revolt and riots in Togo where protesters, using camera-equipped mobile phones, succeeded in putting international pressure on the repressive government. Similarly, demonstrators in Côte d'Ivoire gained international sympathy for their cause by exposing violent reprisals with their cameraphones and lively blogging platforms in Abidjan. André-Michel Essoungou has underscored the view that African bloggers are charting new courses for democratic society. Greater access to the public square is being built with alternate media such as the Congoblog and Ushahidi in central and east Africa.

From Senegal to Angola and Zimbabwe to Sudan, activists from below and government officials from above continue to wage contests to win public opinion through the use, blocking, or negotiation of social media as a tool understood to have a profound impact on local, regional, and global politics. Facebook, Twitter, YouTube, texting, and other venues are used for civic engagements, political mobilization, and dissemination of ideas and information. Public servants and heads of government including Raila Odinga, prime minister of Kenya; Jonathan Goodluck, president of Nigeria; Lindiwe Mazibuko, leader of the opposition in the parliament of South Africa; Paul Kigame, president of Rwanda; David Coltart, leader of the New Party in Ghana; and others maintain Twitter accounts for communication by the government and political parties. Opposition groups also use social media platforms to inform their followers and influence opinion.

Social Media and Politics

Social media, largely understood as the alternative mode of communications fusing human and technological dimensions of communities, has clearly had a strong impact in Africa with the myriad aspects of health, agriculture, security, business, and leisure all affected by its advent. The political component linking the headline-grabbing upheavals of the Arab Spring and other regions has not been as glaring and noticeable. Still, for observers who look deeper, the effects have been remarkable. The circular causality of the dynamics is evident in the ways state and nonstate actors have sought to respond to the effects resulting from the use of social media. Issues of governance, accountability, openness, and human security are raised by the global phenomenon of social media pertaining to sub-Saharan Africa. Movements for greater democratization, human rights, and social justice have adopted varied programs of change in different parts of the region.

Reflections of the global and local in the region are indicated by the fact that Facebook has become the most visited Web site, with more than 17 million users and Swahili, Hausa, and Zulu languages incorporated into the medium. The fact that President Goodluck first announced his candidacy in Facebook similarly underscores the depth of the change in the continent.

In Uganda, groups opposing inflation, corruption, and political mismanagement mounted campaigns on Facebook, Twitter, and blogs culminating in walk-to-work protests believed to have been stopped by the government jamming of the use of all social media. The government of Mozambique also sought to quell food riots by blocking the tools of dissent. While technologies, economic opportunities, and economic infrastructures in sub-Saharan Africa might fall short of those of the affluent world, the consequences of the spread of social media and their impact on politics is, however, as profound and enduring.

Age

Just over half of all Americans (56 percent) have a social media profile and about half of Americans are active users. But more than four out of five young adults are on social media (83 percent, ages 18–29) while less than a third of the oldest Americans are (32 percent, 65 and over). This is the inverse of traditional news use and political participation by age; that difference has fueled a robust body of research on the role of social media in democracy. Much scholarship has found that those who follow news and politics in social media or have friends who do so are better informed, more engaged, and more active in politics, but a competing hypothesis is that social media displaces traditional news use, limiting engagement and participation.

Traditional media use, methods of civic engagement, and political participation are all down substantially since the 1960s, and many of these declines are generational. In the 1960s, the youngest and oldest Americans read a daily newspaper at nearly the same rate. The oldest Americans, those now of retirement age, still largely read a daily print newspaper, belong to a social or fraternal organization, union, book club, or sports league—and more than two-thirds of them vote. Americans under 30, on the other hand, are much less likely to follow news in print or on TV, to join an organization, or to vote. They are more likely to be online than the oldest Americans and much more likely to be active in the social media space. In fact, social media have been described as the new inbox for young adults. The results are promising, but mixed, as to whether social media or online engagement complements or displaces traditional political participation.

Social media and politics intersect in four important ways: As a conduit for the dissemination of information from political leaders and candidates; as an aggregation and distribution source for opinion leaders to attain and share knowledge; as a platform for the manifestation of

pure, participatory journalism and democracy, in which anyone can share knowledge with (potentially) anyone; and as a digital town hall, in which citizens can directly converse with leaders, candidates, and each other. Much of the motivation for the first and fourth forms—for politicians to engage in “direct-to-consumer” contact with the public through social media—is to reach young potential and actual voters.

The scholars danah boyd and Nicole Ellison define social network sites as online communities that allow users to (1) build a public profile, (2) connect with selected users, and (3) peruse and interact with content created by those users. The fact that users define their own communities means that social media connections are networks of peers, and tapping into this peer-to-peer architecture is how things go viral. Politicians and other political actors, and members of advocacy organizations and other nonprofits, greatly employ Facebook, the microblogging site Twitter, and the video sharing site YouTube in their public outreach, beginning in earnest in 2008 but diffusing widely since then. As an example, both MoveOn.org on the left and the National Rifle Association on the right are highly active on all three platforms, which are then used to interact with each other. The federal government’s antibullying arm, stopbullying.gov, embraces Facebook, Twitter, Tumblr, and an active blog expressly to reach teens who are most at risk to be involved with bullying.

The reason for social media outreach is clear: Young adults in the United States follow the news at about half the rate of their elders and even the migration to news online has been led by adults in their 30s and 40s. Ever since the Baby Boomer generation reached adulthood in the 1960s, they, and each subsequent generation, has been less informed, less civically engaged, and less politically involved than the generation before. Social media seems a rich environment in which to reverse this.

Age, Media Use, Civic Engagement, and Political Participation

Robert Putnam painstakingly detailed the generational decline in news use, civic engagement, and political participation. Active leadership in neighborhood and fraternal organizations is half

what it was in the 1960s; union membership, signing petitions, and church attendance are all down dramatically and newspaper readership has dropped by half. All of these factors are age-related—the oldest Americans, those of retirement age, are still much more likely to participate in these ways. Sixty percent of adults aged 65 and older still read a newspaper regularly and 69 percent vote; 22 percent of those under 35 regularly read a newspaper and half vote. While all Americans are more likely to get news online, Americans over 30 are much more likely to get news online than those under age 30. In fact, Pew data shows that online news use is up 51 percent among 18- to 29-year-olds but it is up 140 percent among 60- to 64-year-olds. Pew also found that teens are increasingly likely to be adding Twitter, Instagram, and Tumblr accounts while losing a little affinity for Facebook.

Age and Social Media in Politics

Social media use in political campaigns first appeared in meaningful numbers in the 2006 mid-term congressional elections, when about one in six candidates from the Democratic and Republican parties populated Facebook pages. By 2008 it was more than half. In both of those elections, population age was a strong predictor of Facebook use in the campaign: Candidates running in districts with a large population aged 65 or older did not use Facebook; those representing younger constituents did.

President Barack Obama was a pioneer in targeting young voters online in the 2008 presidential election, when he won the most lopsided margin of young votes (70 percent voted Democrat) since 1976. The race was called the social media election and *U.S. News and World Report* referred to the victory as the Facebook election and the Facebook effect: 2008 was the first year in which candidates truly engaged in a social media conversation with citizens through Facebook and Myspace; it was when Facebook partnered with mainstream news organizations, including ABC News and CNN, and was the first time CNN employed YouTube to integrate citizens’ questions into presidential debates.

By 2010, the lesson had been learned as the Republican Party (GOP) took the lead on Facebook and Twitter, outspending and

outperforming the Democrats in midterm congressional races, which went overwhelmingly to the GOP. Voter turnout among young adults, 18 to 29, was 20 percent; but this time only 58 percent voted Democrat.

The Two-Step Flow of News

Columbia University scholars Elihu Katz and Paul Lazarsfeld found that news did not reach all people in the same way but that news reached some people (opinion leaders) who then curated and disseminated it through their networks. This happens robustly in online social networks but the important political variable is whether there is a high-information node in a network, sharing news with peers. A seven-nation study of youth-oriented civic engagement Web sites throughout Europe found that social identity, online and off, was a major predictor of civic engagement and efficacy among young adults. Shakuntala Banaji and David Buckingham, education scholars in London, learned that having older adults positively engaged, online and off, helped inspire young adults and teens to believe that they could successfully become engaged in political discussions and actions. A lack of personal modeling or engagement, on the other hand—the lack of a peer opinion leader—failed to deliver the same engagement.

Competing Hypotheses

There are two competing hypotheses regarding social media use, civic engagement, and political participation, and age is highly predictive of which is dominant. One body of literature suggests that traditional, offline habits, like news use, talking politics, and voting, migrate nicely into the social media environment and, in fact, may be improved, especially among active users, who tend to be young. Another recent area of study argues that time spent with social media may displace time spent on traditional civic activities like following the news, spending time with neighbors, and heading to the polls.

Homero Gil de Zúñiga and his colleagues have repeatedly found that migrating traditional news and political values into social networking, like seeking and sharing political information, increases civic engagement and political participation. Among those who are active in information

gathering and sharing, and in civic engagement online, political participation increases both online and off. Young adults who share news and political opinions through social media are more likely to correspond with candidates and representatives; contribute, volunteer, or contact a news outlet online; and to vote offline. Another recurring finding is the importance of internal or self-efficacy—the belief that one can influence the political process. Since efficacy is an established, predictive variable of both civic engagement and political participation, it has often been measured in social media. Behaviors that have long been known to support civic engagement and political participation offline, like news consumption and self-efficacy, have repeatedly been shown to do the same in social media. Young adults who are exposed to political news through social media are more likely to engage in political activities like volunteering, donating, and voting. Older adults, who are more likely than the young to follow the news and be engaged and politically active, are also more likely to migrate those behaviors into social media. These findings support a complementary hypothesis, in which social media sharing serves as an adjunct or able replacement for diminished use of traditional news media. Given the sparse use of media by young adults in comparison to their elders, this complementary hypothesis offers reasons for optimism.

A competing hypothesis comes from Putnam, who suggested the decline in civic participation is because entertainment media, especially television, is displacing time that used to be spent engaging in social activities, like bowling leagues and fraternal organizations. This time-displacement hypothesis may also apply to social media use. A 2011 study found that college students who were highly active on social media (spent the most time, visited the most frequently, considered it highly important, and had many friends) were less informed and less likely to follow political news. Those students who were active news seekers were more highly informed and more likely to share news through social media. But they were also much less likely to spend time with social media than those who were not as well informed.

Another important variable in social media research is ambient exposure to news. It is hypothesized that those who score highly on social

media involvement will be more likely to be accidentally exposed to news through that channel as their friends share news. What occurred, instead, is that large networks of young adults, who are the least likely to follow news and politics, were also the least likely to share these items through social media. This tends to support the displacement hypothesis. This finding has been countered somewhat by Gil de Zúñiga and others who have found that, among people who do follow news, large networks contribute to civic engagement and political participation.

Youth, Social Media, and Activism

Students have been leaders in the use of social media, especially Facebook, Twitter, and YouTube, for organizing major social movements. Notable examples include the 2006 immigration protests, especially in California; support for voting, especially for candidate Obama in the United States and against copyright reform in Canada in 2008; protests following the Iran election in the summer of 2009; tuition hike protests in the United Kingdom in 2010; and the Arab Spring early in 2011.

Paolo Gerbaudo, in *Tweets and the Streets, Social Media and Contemporary Activism*, writes about some pitfalls at the intersection of social media, youth, and politics. In the Egyptian uprising which began the Arab Spring in January and February 2011, Egyptian leaders had taken a hands-off approach to limiting access to social media for the strategic purpose of winning over young, middle-class Egyptians. This was the cohort by far the most likely to be online and to be active in social media. In fact, they became known as shabab al-Facebook and they emerged as a powerful source for information and instigation in the spread of the Arab Spring.

Conclusion

The complexity of the social media environment, news, and political involvement is largely explained by age because age largely predicts media use, which predicts civic engagement and political participation. The oldest Americans are the most likely to follow news in print; those of middle age, on television; but those in their 30s and 40s—not their teens or 20s—are the most likely to follow news online. For this reason, the

social media environment, where the youngest adults dominate, remains an important space in which to try to reach young adults.

Aggregation

The term *aggregator* refers to a person or service involved in the collection, refinement, and indexing of information from a variety of online sources. This term has been used on the Internet for years, based on the idea that the Web functions to combine a variety of distinct sources of information into a single coherent form. In the most general sense, a search engine functions as an aggregator, scanning Web pages and producing indexes that can be efficiently surveyed as a form of extractive media. Search engine results and

other aggregated media are intended for browsing rather than immersive reading. There are a number of types of aggregator Web sites, ranging from those that collect pictures to economic data. News aggregators and poll aggregators are distinct. The differences between news and poll aggregation can be used to understand aggregation as a general concept.

News Aggregators

News aggregators collect materials from a number of news sources, providing direct links to the original material and possibly brief summaries of content from a number of sources. The interfaces provided by aggregator Web sites allow users rapid access to information that has been refined and indexed. The particular methods for refinement and indexing explain the differences among aggregator brands. An aggregator might rewrite headlines to emphasize a particular argumentative perspective in order to better serve a market segment. A popular culture aggregator might include news items but only in the sense that they fit with the overall theme and style of the brand. A political aggregator would likely not include the funny pictures of cats that have come to typify pop culture aggregators in favor of poll results and analyses. Functionally different aggregator sites segment the market similarly to cable television channels.

Aggregators typically eschew the traditional news schedule, releasing material as it is collected or created. This draws users regularly as the pages include a much larger range of regularly updated information than a single news source. For readers, the appeal is clear: Aggregator sites provide quick access to a large amount of information that has confirmation from multiple sources. Nonlinearity is a major advantage for aggregators as users can access different news stories at random outside the narrative context of traditional news that might provide occasions for advertising. By removing material from the context in which it is presented alongside advertising, news aggregators have been accused by content providers of damaging their businesses. The relationship between aggregation and newspaper revenue is complex. Some content producers have argued that aggregation deprives their sites of traffic and thus revenue. Content aggregators respond that a

large number of clicks on headlines on aggregator services leads to users reading full articles, serving as a major source of online traffic for newspapers. The *New York Times* has demonstrated that paywalls (methods of requiring users to pay for online subscriptions after reading small samples of articles) offer a way of using aggregation as a form of advertising and securing revenue.

Poll Aggregators

Poll aggregators work in a similar but distinctly different way. A Web page that aggregates poll data does not collect material from legacy news sources but information from a variety of sources that needs an effective index. Several sources provide real-time aggregation of Twitter output and trending topics. These collected measures provide users a refined sense of what is happening on social networks in concrete terms. More sophisticated aggregation systems, such as those used for tabulating aggregated election statistics, employ algorithmic technologies to create value-added indexes for a number of quantitative data sources. By synthesizing inputs from a number of sources, aggregator Web sites provide a more robust form of information.

Poll aggregation Web sites played a major role in the final weeks of the 2012 presidential election. When major information aggregators' projections tended to show a substantial lead for President Barack Obama, the use of aggregated data became a news story in itself. Aggregators provide important forms of public information in that they present information coherently through an objective process over traditional, highly impressionistic forms of political reporting. This has been described as providing what has been termed *big data* in the world of journalism. Aggregators provide a site where dialectical processes are applied to data before public consumption, providing aggregators credibility beyond narrative journalism beholden to a fragmented public sphere. In this sense, arguments are pre-debated to create coherent results that are judged to be the best from an objective standpoint. The importance of data aggregation for social media-enmeshed publics will likely increase as the rapid argument presentation and testing on social network sites will require increasingly comprehensive forms of data for users' needs.

Poll aggregation offers a major source of value for news agencies or news aggregators as the concept of aggregation solves major issues for publishers. Managing relationships with aggregators can be a complex matter as management methods are mixed: Some rely on human editors, while others function through user preferences or other automated means. The importance of the integration of mechanical elements should not be understated—if an aggregator uses a publicly accessible method for collecting and analyzing data, the relative credibility of the aggregator can be substantial and can be inoculated against arguments of bias.

In terms of aesthetics, aggregated information functions as a sort of collage. Instead of presenting a single argument or perspective at one time, aggregation allows users to see a number of perspectives to evaluate simultaneously. Google News, for example, uses a juxtaposition of different popular articles covering an event, providing a rapid glimpse of multiple possible readings and sources the reader can choose among. Other aggregators carry articles that cover a number of topics and ideas with looser organization. In poll aggregation, information converges. Instead of presenting a sea of numbers, refinement techniques allow the aggregator to present a single representation of a current fact or stream of online social activities. Typically, additional information is available for more interested users. Aesthetically, these methods for managing the arrangement of information are a form of rhetorical activity.

Conclusion

Aggregation provides opportunities for users to gain rapid access to refined indexes of information. As a form of computational reasoning, this gives aggregated data sets credibility for use in public argument. News and culture aggregators have effectively produced a form of continuous, in-the-moment information uniquely suited for persons using social networking systems. Aggregators are likely to increase in importance as their capacity to drive traffic to news sites with paywalls becomes more apparent and as the cultural logic continues to provide substantial gains for collections and collages of news over singular news sources.

Al Gore's Penguin Army

On May 24, 2006, the same day that Al Gore's *An Inconvenient Truth* was released, a two-minute video titled *Al Gore's Penguin Army* was released on YouTube. The video sparked a series of controversies as many viewed the video to be a product of astroturfing by a major company to dispel any potential truth from Gore's movie. The video has a definitively amateur feel with very low production quality. The drawings are primitive, and the sound effects seem to be more in tune with middle-school projects than professionally developed marketing tools.

The *Wall Street Journal* found the release date curious and chose to investigate the video more closely. They ultimately traced the video back to the DCI Group—a Republican public relations and lobbying firm that represents both General Motors and ExxonMobil. While many in the public believe either company could be behind the video (although most seem to believe Exxon is responsible), to this date the actual developer has yet to be identified, and DCI refuses to release the information. As of today, the video has been watched 630,426 times while collecting 1,410 thumbs-ups and 4,003 thumbs-downs.

At the beginning of the video, a penguin carrying an umbrella and designed to look like Al Gore leads a group of other penguins into a lecture hall where he presents a talk on global warming. As his audience grows increasingly bored with his presentation (which attempts to link global warming to the Middle East crisis, the latest Lindsey Lohan scandal, and even the Red Sox winning the World Series), the Gore penguin uses a twirling motion of his patterned umbrella to hypnotize the others. Once hypnotized, the background changes to something called Red State Theater. At the theater, there are long lines of penguins waiting to see the X-Men movie, while less than a handful are waiting for Gore's movie. While the penguins at X-Men have a great time, those at *An Inconvenient Truth* are sleeping.

After the movie scenes, the video returns to the classroom setting where Gore tells the sleeping penguins they must take action to stop global warming. He fails to even realize that the audience has failed to hear his point—let alone become willing to act on it. The screen then proceeds to provide a series of recommendations on how citizens can stop global warming. The list includes not exhaling, being a vegetarian, walking everywhere, and taking cold showers. At the very end of the YouTube video, a shark eats a penguin and the screen flashes “The End” before Gore opens his umbrella and begins attempting to hypnotize the audience.

While the video is somewhat humorous, it has a homemade quality. At first viewing, it seems more likely to be the product of a college student creating a quick video satire in his or her dorm room than a professionally done video with an explicitly political message. Most viewers believed the individual who posted the video (Toutsmitth—a 29-year-old claiming to be from Beverly Hills) was exactly that.

Of the initial watchers, few felt there was any mass conspiracy behind the video or effort to influence public attitudes through the video's posting—it was simply viewed as a humorous satire. *Wall Street Journal* reporter Antonio Regalado, however, noticed a peculiarity. Despite being a very low-quality YouTube video, it was the first sponsored hit in Google when searching for Al Gore. This suggested someone (or some group) had spent a large sum of money on search engine optimization and to buy ad space for the video.

Former vice president and Nobel laureate Al Gore speaking on climate change and poverty in Davos, Switzerland, on January 24, 2008, at the annual meeting of the World Economic Forum.

Curious as to who or why, Regalado e-mailed Toutsmitth and found that he was working from a computer associated with DCI.

DCI refused to discuss the linkage, citing client confidentiality in their defense. Yet, after Regalado's communication, the sponsored links on Google were removed. The video contains no actual information and instead focuses on simply attempting to discredit Al Gore and *An Inconvenient Truth*. Assuming DCI was responsible for the creation of the video, it is clear they were building on America's distrust of the mainstream media. Rather than presenting an op-ed, they posted the video on YouTube in an effort to get citizens to buy into the content and presentation. With social media, however, this is becoming an ever-increasing concern. If citizens are unwilling to trust mainstream media and believe any presentation of fact is largely based on some biased opinion or attitude, they will turn toward sites such as YouTube, which permit individual citizens

to create their own accounts and videos. But, sophisticated lobbying and media relations agencies have quickly realized that these mechanisms can be successful and have started taking strides to infiltrate the medium. What they learned from the *Al Gore's Penguin Army* video, however, is the need to dot all the I's and cross all the T's. If not for the Google search purchases, the farce would have likely been successful.

To date, Exxon, General Motors, and DCI have all refused to acknowledge the controversy and the party responsible for the creation of the video and purchase of the Google-sponsored ads remains a mystery. The video has had little impact on the climate debate—as evident by the failure to reach a million hits in over five years. Yet, the work of Regalado helped to protect social media sites like YouTube from poorly conceived efforts by political players to falsely represent their funders and goals in posting content.

the transformative influence of the Al Jazeera satellite TV network on international and regional politics, it also connotes new media in general, including various state-funded broadcasters and the assortment of Web and mobile information and communication technologies (ICTs). New forms of media and news sources are changing politics because they "altered the dynamics of influence" such that "states, media organizations, and political actors cannot set agendas or establish boundaries of discourse" as effectively as they once could. This, of course, comes with several caveats.

Seib proposed the Al Jazeera effect as a parallel to the CNN effect, which asserted that media coverage of overseas events or issues could compel governments to act, leading to less governmental autonomy in foreign policy. Taking a different course to the same long-studied question of the power of media in politics, Seib asserts that governments are losing control over news and information and are forced to compete with new types of actors, including nontraditional news organizations, citizen journalists, bloggers, insurgent media, social movements and nongovernmental organizations (NGOs). New media are "superseding the traditional political connections that have brought identity and structure to global politics."

Seib's description of the Al Jazeera news channel's impact on Arab politics shows why the Qatar-based network's name is borrowed for the term. Although it is a relatively young station, founded in 1996, one of its biggest "strengths" was to inject "contentious debate into an Arab news business that was previously known for its drab docility." The effect is about the disruptive power of a more greatly distributed media ecosystem in the political realm.

Seib proposes the "virtual state" as an emerging counterweight to the primacy of the territorial states that made up the world system. This new form is an ICT-based community that actualizes what Seib calls "imagined" comradeship, borrowing on Benedict Anderson's "imagined communities." The "virtual state" gives cohesion to collective identities that lack what states are premised upon, the physicality of a defined territory. These are formed by deeper affiliations than the types of connections the more commonly used term *network* denotes. Seib holds out as an example

Al Jazeera Effect

Philip Seib employed the term *Al Jazeera effect* to describe the impact of the global proliferation of emerging news organizations and communication channels on world affairs. While inspired by

the assemblage of Kurdish Web sites, chatrooms, TV stations, and press that manifested a “Kurdistan” when none existed on the map. This Kurdish identity, which draws together a multilingual people whose homeland overlaps with contiguous regions of Turkey, Iran, Iraq, and Syria, presents a particular challenge to the governments of each state. They still operate on a traditional concept of sovereignty to repress expressions of Kurdish nationalism, with varying degrees of success.

Another example of a “virtual state” exemplifies the “dark side” of the effect. Al Qaeda and its affiliates’ effective use of media and communication to recruit “citizens” to its ideology undermines the traditional state system. With franchises in Iraq, north Africa, and supporters elsewhere in the world, Al Qaeda uses violence to pursue its transnational objectives in defiance of governments. In Al Qaeda’s war, the realm of media is a crucial battlefield. Al Qaeda’s media production unit released videos to news organizations and its Web sites are intended to further their cause and weaken their enemies.

The Al Jazeera effect, however, could be most pronounced in shaping global politics, where it gives more connective form to the great supranational identities. A global Muslim *ummah*, or community of followers, could start to articulate itself more completely through wide use of ICTs. Though the concept is in the Koran, the Muslim holy book, numerous national, ethnic, and sectarian divisions brought fragmentation of the more than 1 billion people in the world calling themselves Muslim. While only a possibility thus far, the unification of the *ummah* could fundamentally transform global geopolitics and push states to submit their foreign policies to pursuit of a popular, pan-Islamic agenda. While Seib admits this is speculative, it demonstrates how a dramatic shift in world affairs is made possible.

Domestic Politics

New media not only alter international affairs, but also redirect domestic politics in all but the most destitute and isolated countries. Many politicians embrace changing media environments, using ICTs, for example, to present themselves “unmediated” to potential donors or fund-raisers. This is more revolutionary than the introduction of television, which made candidates’ telegenics

in political campaigns of central importance. Politicians adjust and politics changes to meet the demands of new media.

In authoritarian states, the emergence of media outlets challenges governments that resist reform and control the flow of information. New sources of information are more likely to let the public discover the failings of official state media that stick closely to the government’s line. Citing China as an example, citizens in constricted political systems are finding ways to get news the ruling powers seek to block. China, like many countries, faced the dilemma by which Internet access is important for economic development—since international business requires it—while stimulating internal dissent seen as a threat to the reigning political order. Within this balance, China’s many censors play a cat-and-mouse game to block Web content while activists and interested citizens find new ways to circumvent them.

Still, Seib recognizes the growth in communication avenues involves negative consequences beyond the added benefit to terrorists, scammers, and others with nefarious motives. With so much information out there, people struggle to determine what is valid, amounting to an inaudible “cacophony.” Such overload can be worsened as greater circulation is given to falsehoods, especially as the gatekeeping functions of traditional news organizations weaken. With greater competition, the economics of media may shift, and shriveling advertising and subscription revenues do not sustain operations. Also, many emerging news organizations are more like political actors, affiliated with states or nonstate movements, making them active participants in conflicts. They may advance particular agendas and become targets of military attacks as quasi-combatants.

For all the potential of new ICTs, they clearly will not solve some of the most pressing social problems, Seib admits. In societies failing to meet basic living needs, their potential to improve political processes is highly unlikely. Even in places and geopolitical fields ripe for social and political change, communication and media as forces for change compete with many other, sometimes more powerful factors. The Al Jazeera effect is therefore limited and conditional.

Overall, the tide of new information sources is uncontrollable and that can make predicting the

success of democratization and peace-building difficult. Seib is still cautiously optimistic that the Al Jazeera effect can engender greater transparency and “intellectual independence” among the public. The public will more easily make demands on state officials and agencies that are finding it harder to ignore popular will. New media empower democratization movements and amplify voices seeking reform. Seib argued this would likely materialize in the Middle East, but he could not say when. As popular uprisings raged across the Middle East in 2011, many observers have debated the role of media in fermenting them—the question at the heart of the Al Jazeera effect.

source they follow closely and trust, they assess allegations of bias on any source that fails to adhere to their personal views of the world. It was with this in mind that Clay Shirky—a professor of new media at New York University—suggested in November 2009 that the nature of authority is up for grabs in the current news environment. Shirky argues that new classes of aggregators (such as Google, Wikipedia, and even Facebook) are eroding the institutional monopoly of authority previously held by large corporations. With the advent and further development of social media, the reliability of these new aggregators has become even more important. After all, whether we can truly believe everything we read on the Internet ultimately depends on where we’re reading it.

When we give a source authoritative status, it demonstrates a few things. First, it says that we trust the particular source of information. Not everything posted on the Internet is true. Countless examples exist of individuals pulling information from the Internet and declaring it fact, only to be proven incorrect. It is why academics resist the urge to cite sites like Wikipedia, despite the information provided. But, most important, authoritative status tells us that others accept the information presented by a particular source as correct. This explains why students may opt to not cite Wikipedia as their faculty members may give little credence to information from the site. Even if students believe it to be true, whoever they are reporting to must share that faith before the source is viewed as authoritative.

Shirky defines algorithmic authority as:

. . . the decision to regard as authoritative an unmanaged process of extracting value from diverse, untrustworthy sources, without any human standing beside the result saying “Trust this because you trust me.”

In his characterization, Shirky presents three key elements of algorithmic authority. First, Shirky asserts that the algorithmic authority takes material from multiple sources. Of these sources, none are widely regarded as being universally trustworthy. No single person ever is tasked with indicating the results are valid (or reliable) before the information is published. Ultimately, such functions

Algorithmic Authority

Most Americans, it is often argued, have become distrustful of the mainstream American media today. While many citizens have a particular

exist widely on the Internet. Google does this for PageRank, and Wikipedia largely does the same through its transparent postpublication review.

The second key element according to Shirky is that the algorithm must produce good results. By producing these sound results, people learn to trust it. At this point in the process, the aggregator becomes an information tool—but it is still not an authoritative source. The third characteristic demonstrates the development of the aggregator as an authority. When people become aware of their own trust along with the trust of others, an authority is born. Think about Wikipedia as an example. If an individual trusts Wikipedia, but those the individual is talking to do not trust Wikipedia, citing the site will not gain the individual credibility. If they do trust Wikipedia, however, the individual will be able to relay any information from the site to the people he or she is speaking with, and no one will question the information presented.

Shirky discusses how the development of algorithmic authority is both similar and different to how we have always derived authority. Most important, however, is that authority is a social arrangement, not a cultural fact. As a result, authority runs on a wide spectrum. As Shirky explains, some forms of authority are respected enough to settle a bar bet, while others should be included in congressional speeches or dissertation defenses. At present, algorithmic authority seems to be more closely aligned with the bar bet pole, but as sites like Wikipedia have begun focusing on validity and citations, it has grown in authoritative value. For Shirky and others who now study the idea of algorithmic authority, the key take-away is that the concept is at least being placed on the spectrum and seen as a potential authoritative source moving forward.

Algorithmic authority is not universally viewed as authoritative yet for myriad reasons. First, the authority status can change daily. Some elements may be authoritative, while others are not (consider the difference between YouTube and the YouTube Government channel). Second, they can still be manipulated almost as easily as the megacorporations they are potentially replacing. And third, some types of information and knowledge are not able to be measured for accuracy. Nevertheless, algorithmic authority allows individual users to judge the validity of information

presented unfiltered. No longer does an institutional monopoly serve the role of determining what information is correct or incorrect and presenting it as so.

A-List Bloggers

See Alpha Blogger

Alpha Blogger

In a broad sense, an alpha blogger can be considered someone with a highly respected opinion within a specific community in the blogosphere. But, in a networked media system, any message in the blogosphere (as well as in other social networks) can be quickly spread to other media spaces, platforms, and communities. Therefore, the message must be a respected opinion that was created from blogs, and it can be easily expanded to other media systems, such as the mainstream media. This opinion leader is not just respected

within a blog's community. An alpha blogger's message can be used in other media spheres, and this coverage has consequences, such as the change of media agenda or even the pressure over politicians, companies, and other public actors.

The concept of influence is a key point, at least in terms of generating echo and debate, and therefore, it is important to underline that not all widely read authors can be considered alpha bloggers. Many bloggers have good search engine optimization and huge statistics of unique visitors, but their articles and opinions are not taken into consideration by the people who are interested in that topic. This point leads us to a second characteristic of an alpha blogger: His or her influence is over a specific theme, such as technology, fashion, media, education, or politics.

Initially, the first alpha bloggers were identified within the media tech agenda. The first alpha bloggers showed a growing influence over tech media thanks to reputation, novelty, and a special way of reporting in their articles. Due to the small size of the blogosphere during the first years of this community, identifying alpha bloggers was not complicated. People like Dave Winers, Doc Searls, and Robert Scoble became alpha bloggers; they knew how to become heavy influencers within specific topics.

Before taking into account the personal influence of some bloggers, it is important to remember that the blogosphere itself is a sort of community that has gone through different stages. The first was the appearance of bloggers in 1999; the second lasted until 2004, when the blogosphere attained popularity in the media; and the beginning of the third stage occurred in 2005, when blogs became a sort of professional media with commercial operations such as the purchase of Weblogs Inc. in October by America Online (AOL) for \$25 million. In this deal, the media group AOL acquired 85 blogging sites about many different topics, from technology to movies and travel. This event proved media were aware of the influence of many bloggers.

In every one of these stages are examples of how bloggers became individual influencers within specific topics. Today, the blogosphere is no longer a new network and its growth has slowed, but its maturity as a social network allows analysis with more perspective.

Social Media as Surveillance and the Influence of Blogs

Within a scenario of growing surveillance of social media over actors such as politicians, companies, and media, there is no doubt that bloggers have become some of the most active watchdogs of the media landscape. And, following the work of Hugh Hewitt, there are several examples of this surveillance.

Journalists themselves are under surveillance by the blogosphere. Dan Rather of CBS News is a high-profile example who suffered from its impact. In September 2004, some messages were published on forums at FreeRepublic.com discussing the validity of the documents used by CBS to show the alleged privileges of President George W. Bush during his tenure with the Texas Air National Guard. This was the beginning of a blog campaign against Dan Rather, signalling the beginning of his fall, which concluded when it was demonstrated that the documents Rather reported were forgeries. In this case, blogs such as PowerlineBlog.com, WizBangBlog.com, and RatherBiased.com can be identified as strategic nodes that developed the story that finally ended with Dan Rather's resignation. These blogs, in collaboration with others, got the proof necessary to demonstrate that the documents were false, and they got the story to the mass media. Based on the Rather incident, Matthew Sheffield (RatherBiased), Paul Mirengoff (Powerline), and Kevin Aylward (Wizbangblog) can be considered alpha bloggers. They changed the media agenda and public opinion, resulting in the fall of Dan Rather.

In another political case, the resignation of U.S. Senator Trent Lott from Mississippi is a paradigmatic example of blogger political surveillance. Lott made some racist statements at the end of 2002 at the birthday party of Senator Strom Thurmond. The tipping point was the fact that prestigious media like the *Washington Post* did not mention the controversial and racist comments. But, Josh Marshall, with his blog Talking Points Memo, started a conversation around the issue.

Josh Marshall covered what the professional media had missed. This case is one of the earliest examples of the power of the blogosphere to modify the mainstream media agenda and to force the media to report on issues they may not want to. Although mainstream media reported almost

nothing of Trent Lott's segregationist statements, on the Internet, the news was quickly spread by hundreds of blogs.

Alpha bloggers are no more than the channels for collective intelligence, tipping points on the Web that give relevance to those issues that should be part of the mainstream media agenda. Alpha bloggers are not the cause of this visibility, but they accelerate it. The reason for the effectiveness of alpha bloggers lies in the credibility they gain over long terms on the Web, their ability to tap resources and acquire proof that professional media did not obtain, and their independence from large media groups and political and business lobbies. This independence is perceived by bloggers as their best advantage.

Today, becoming an alpha blogger is more difficult than during the first years of the blogosphere. Now, the community is much bigger, the media ecosystem is more complicated and interlinked, and there are more social networks (microblogging) that are competing for attention in a crowded marketplace.

American Debt Crisis and Twitter

The American debt crisis refers to the 2011 financial scare when Republicans threatened to obstruct

legislation required to raise the debt ceiling if the Democrats did not agree to sweeping spending cuts. The debt ceiling is a distinct piece of legislation that is ancillary to the budget process, requiring congressional approval and a presidential signature. The debt ceiling is viewed largely as a formality required to continue the Congress's and the president's economic agenda. Failure to raise the debt ceiling could result in a financial calamity, sending the United States and possibly the world economy into an economic depression.

Despite the real and measureable consequences attached to the debt ceiling, congressional leaders used its built-in sense of urgency as a rhetorical and political tactic. These debates took place in the context of what many economists call the worst economic recession since the Great Depression. Nervous investors worried that failure to act swiftly could cause credit agencies to downgrade the U.S. credit rating, which would instigate a double dip recession.

Similarly, frustrated citizens took to social networking sites, like Twitter, to express their discontent. Here, the aggregated voices of citizens inaugurated a new regime of public participation in economic policy as Twitter changed the nature of the debt ceiling debates. This entry traces the relationship between the American debt crisis and social media—from its origins in the dot-com bubble of the mid-1990s to the debt ceiling debates and the public's response on Twitter.

History

The story of the American debt crisis begins in the late 1990s with the dot-com bubble and subsequent collapse. While the harbinger to the Internet, Advanced Research Projects Agency Network (ARPANET), was developed in the early 1960s, it was not until the early 1990s—with the introduction of Netscape's browser Mosaic—that the Internet fully entered the public's imagination.

By the mid-1990s, Internet industries began posting record profits by trading on the public's high expectations that everything from banking and investment to travel and entertainment would now become digital. Corporations ranging from Netscape to eBay pioneered new revenue streams grounded in what became termed as the "attention economy."

Public reaction to the American debt crisis and the resulting debt ceiling debates included both street protests and innovative use of social media. These marchers carried banners referencing the housing crisis at an Occupy Wall Street protest against the Bank of America and its foreclosure policies on March 15, 2012. The event included a symbolic "occupation" outside of a bank branch office.

The premise of this attention economy is information overload, which envelops consumers in a flood of goods and services. In this environment, the material production of goods is secondary to securing the antecedent conditions for consumption—mainly capturing attention through advertising. Unlike traditional economic models that privilege supply over demand, the attention economy privileges demand over supply. As the volume of goods increasingly exceeded demand, consumption became less of an automatic process and more an act of strategic decision making on behalf of the consumer. In short, people's attention became another commodity that was bought, sold, and traded. In the dot-com bubble, it was the shiny, new technologies that entranced investors and begot rapid speculation over future earnings.

Unfortunately, the good times proved unsustainable because a schism grew between the actual value of Internet start-ups (use value) and their speculative representations in public culture (exchange value). Netscape, for example,

had no proven earnings yet grew exponentially from its initial set price of \$28 per share to \$71 in a matter of months. The dot-com boom, as it is called, earned savvy investors millions. As G. Thomas Goodnight and Sandy Green note in their essay "Rhetoric, Risk, and Markets," the growth of Netscape was premised almost entirely on assumptions about its future earning potential. Whereas previously, companies such as Microsoft had to prove their earnings through years of operational experience, Netscape and countless other dot-com start-ups traded exclusively on their perceived capacity to produce massive revenue. Goodnight and Green suggest that this sort of behavior, which produced the dot-com bubble, as the hope of new communication technology, rapidly surpassed its material capabilities. The bubble burst on Friday, March 10, 2000, when the National Association of Securities Dealers Automated Quotations (NASDAQ) tanked and drew into relief the differences between use and exchange value.

The dot-com collapse, as Joshua S. Hanan observes in his essay “Home Is Where the Capital Is,” forced Wall Street to find new financial outlets for profit-making. The same year that NASDAQ witnessed major declines, Wall Street lobbied Congress to pass the Gramm–Leach–Bliley Act (GLBA), which repealed some of the consumer safeguards codified in the Glass–Steagall Act of 1933. Congress reasoned that gutting some of the post-Depression era protection would invite a swell of capital and resuscitate the United States’ ailing economy. The passage of GLBA dissolved the regulations that separated investment from commercial banks, allowing Wall Street to participate in practices previously reserved only to commercial banks—such as credit default swaps (CDs) and collateralized debt obligations (CDOs).

In addition to Congress’s deregulation of Wall Street, the Federal Reserve also felt compelled to intervene by lowering national interest rates to unprecedented levels, hovering around 1 percent by 2003. This move prompted mortgage lending institutions to offer home loans at historically low rates and made home equity lines (which are contingent on the federal interest rate) increasingly appealing. At Congress’s and the Federal Reserve’s behest, financial institutions also began offering products aimed at giving low-income families the means to secure homes. This new kind of loan, dubbed subprime mortgages, had lax qualification standards and was not insured by the federal government. Banks compensated for the risky investment by charging higher interest rates and deferring their risk to the new securitization processes opened up by CDOs.

Housing Bubble

All across the United States, people felt compelled to buy up homes with a fervor never before seen. From home valuation Web sites such as Zillow.com to television shows like *Flip This House*, a larger cultural trend emerged that conceptualized the home as an investment more so than a residence. Rather than serve merely as an adequate representation of home values across the United States, Zillow.com helped produce such values by virtue of the site’s linguistic organization. By entering a number of complex debates centered on the present economy, countless renters,

homeowners, and real estate professionals perceived their discourse as an instrument that could reflexively manipulate the invisible hand of the marketplace. Unfortunately, this irrational exuberance could not be maintained as home prices began appreciating at unsustainable rates. By late 2005, the United States replaced dot-com speculation with a housing bubble. As huge deficits began mounting on Wall Street and Main Street, the pocketbooks of the federal government ultimately became infected. By late 2007, America was embroiled in the worst financial crisis since the Great Depression.

Crisis

As a response to the crisis largely attributed to President George W. Bush, U.S. citizens elected Democrat Barack Obama as president and charged him with the task of fixing America’s financial woes. His first policy directives included passing the \$800 billion American Recovery and Reinvestment Act of 2009, or the economic stimulus, as it is more frequently referred. Almost immediately after Congress ratified the stimulus, conservatives expressed concern that it was counterproductive and reckless. If irresponsible spending created this mess, Republicans reasoned, more spending certainly would not help the problem.

Many citizens agreed with the conservative critique of Obama’s fiscal policy, and they gave Republicans control of the U.S. House of Representatives during the midterm elections in November 2010. This afforded conservatives leverage in the upcoming budget negotiations due to occur that summer. In April 2011, Obama gave a national address on the budget, which outlined \$4 trillion in cuts to nonentitlement programs and defense spending over the next decade as well as tax increases on those making over \$250,000 per year. Republicans scoffed at this legislation, suggesting that it relied too heavily on taxing the rich and failed to include enough spending cuts.

In May 2011, Secretary of the Treasury Timothy Geithner announced that the government was quickly approaching its debt ceiling, and while the Treasury could take some measures to prolong the time before the United States passed its borrowing limit, legislation was needed before August 2, 2011.

Republican Speaker of the House John Boehner seized this opportunity to force the Republican agenda and argued that neither he nor any Republicans would support the upcoming debt limit increase without deep spending cuts. Annie Lowrey, writing for *Slate*, described the debt ceiling as a “political football” that oppositional parties—both Republican and Democrat—have used to advance a partisan agenda. Republicans held the debt ceiling hostage until their demands were met. For example, Lowrey reported that Representative Michele Bachmann advised Congress to immediately slash \$125 billion a month in spending rather than lift the debt ceiling. The debt ceiling debates, as the media came to call them, became a proxy battle for broader economic stewardship. Each side adduced a fiscal agenda on how to handle the United States’ massive debt moving forward.

The Debt Ceiling Debates and Twitter

The public reacted to this impasse by taking to the streets and various social networking platforms. Jeff Jarvis, a prominent U.S. blogger and journalist, took to Twitter to express his frustration. He tweeted, “Hey, Washington assholes, it’s our country, our economy, our money. Stop fucking with it,” and “People, it’s time to get fucking pissed off.” The next day, Jarvis exclaimed “FUCK YOU WASHINGTON. C’mon, people. Let’s hear it.” On July 24, 2011, “#FuckYouWashington” trended on Twitter and generated 20,000 hits in under an hour. In response to this new trending top, Jarvis joked, “I do hope Twitter doesn’t have a prissyfilter for trending. #FuckYouWashington.” Beyond frustration with partisan bickering, the Twitter flow portended a broader public concern for America’s standing in the international economy. Whereas America was historically viewed as the global debtor state—with its currency functioning as the gold standard up until the early 1970s—citizens worried that America, “the shining city on the hill,” was dimming. Jarvis’s digital act of defiance demonstrates the complex relationship between social media and the American debt ceiling. Not only were social media responsible for the origins of the crisis (through the dot-com bubble), but they also became a powerful medium that created a temporary space for disagreement and dissent regarding

proposed solutions. Indeed, the more individuals expressed their concern about the debt ceiling, the more attention it received. This process is theorized at length by Damien Smith Pfister who notes in his essay, “The Logos of the Blogosphere,” that blogging platforms, such as Twitter, allow the public to shape deliberation.

Pfister outlines three overlapping ways social media shape matters of public concern, such as the American debt ceiling. First, social media grant the public a new voice by allowing them to circumvent the gatekeeping of traditional media outlets that set the agenda for matters of national importance. Indeed, it is highly unlikely that an editor would allow #FuckYouWashington to appear in a periodical. Twitter bypasses this traditional sieve, favoring the aggregate (or trend) to dictate which conversations will be seen by the public. Conventional news outlets are then forced to reflect on the discourses as the tweets become ubiquitous in the public sphere. For instance, on July 25, 2011, the newspaper periodical *Reuters* published an article on the #FuckYouWashington Twitter feed that highlighted the nation’s anger with an increasingly dysfunctional political system. Many other news outlets followed suit shortly after.

Second, bypassing the gatekeeping function allows for a diversity of views that facilitate the production of novel lines of argument, or topoi. In contrast to the media’s coverage of the debt debates that focused on the partisan bickering, Jarvis injected his frustration and citizen’s discontent. Third, Twitter enables instantaneous and continuous publishing of arguments, thoughts, claims, and gripes, which accelerates and diversifies the number of arguments available. While old models of media require publication time—printing, editing, and so on—Twitter is instantaneous. As such, it provides an excellent platform for citizen participation because it provides an outlet that can keep pace with a rapidly changing debate. In short, microblogging platforms provide a communication medium that truly brings ordinary citizens into the public sphere.

The nation’s reaction to the American debt crisis on Twitter offers an interesting example of how social media have transformed the ways citizens participate in public policy—particularly in regard to economics. Whereas economic policy

has historically been relegated to the deliberative expertise of economists, congressional leaders, and the likes of the Federal Reserve, social media have carved out a space for citizens to engage in these increasingly pressing matters. As the #FuckYouWashington Twitter feed demonstrated for so many, social media are increasingly breaking down the meditational buffer between citizens, public representatives, and economic valuation. Unfortunately, such dissent was not enough to halt Standard and Poor's August 5, 2011, decision to downgrade the United States' credit rating from an AAA to an AA.

American Enterprise Institute

The American Enterprise Institute (AEI) bills itself as a nonpartisan think tank composed of scholars and supporters who are committed to supporting the advancement of "liberty, increasing individual opportunity, and strengthening free enterprise." It is one of the most powerful and influential think tanks in Washington, D.C., and boasts a staff of over 185 employees and 50 adjunct fellows. It should be noted that its nonpartisan stance does not mean it avoids taking sides on political issues. Generally, its views are closely aligned with the business/economic wing of the Republican Party, though it does not generally comment on social issues that energize other portions of that party's base. The institute has seven focus areas for its research: economics, foreign and defense policy, politics and public opinion, education, health, energy and the environment, and society and culture. Not only does it widely publish its reports on a variety of related issues, but it also has become an important online presence and favorite source of information for American conservatives. Its *AEI Ideas* blog has daily traffic that sometimes exceeds 40,000 visitors and its online magazine *The American* also maintains a prominent place on the Web, in part because of its American.com Web address.

A brief look at the history of the AEI shows that it traces its roots back to the 1938 founding of the American Enterprise Association (AEA), in an age when economic issues were very much a part of politics as evidenced by Franklin Roosevelt's New Deal policies and the efforts to recover from the Great Depression; yet at the same time economists played almost no direct role in the government or major advocacy groups. AEA began its academic and advocacy role in 1943, when its members wrote a series of 50 analyses of different bills before the U.S. Congress. These analyses were meant primarily to assist legislators in understanding how a given piece of legislation might impact the business and economic interests of the United States and particular industries. The following year, the AEA established another important piece of its ongoing identity and role in the Washington, D.C., power structure when it created a board of several eminent academics, including people like economist

Milton Friedman and political scientist James Q. Wilson. By the 1960s, the AEA became more of a force in wider American society. In addition to continuing to publish its legislative analyses, which according to its own bookkeeping had been consulted by 85 percent of senators and 73 percent of House members, it also created materials for use in school debate programs. In 1962 it changed its name to its current American Enterprise Institute.

One of the most unappreciated aspects of its history is AEI's role in creating daily press briefing materials for Congress. This practice was so beneficial, that soon the White House began releasing its own daily press summary in order to provide its take on the day's news. In essence, it was one of the world's first news aggregators. Furthermore, it was one of the earliest research/advocacy groups to incorporate computer technology in order to process more data, in this case regarding the U.S. federal budget. From the 1970s onward, AEI would host some of the most famous economic and political scholars in the United States, many of whom had served or would go on to serve in the administrations of Ronald Reagan, George H. W. Bush, and George W. Bush.

AEI scholars, including Irving Kristol, have even been credited with launching the neoconservative political movement, though others like Norman Ornstein are openly more centrist or liberal and are also allowed to publish under AEI's auspices. In recent years its activities with the more Democratic Party-aligned Brookings Institution have produced notable publications on the process of political campaigns and public engagement and the role of the various institutions of government in providing access points for the public to interact with the state. It is in this sense in particular that one sees that its claim of nonpartisanship is given actual funding and support in its research activities.

Social Media

For social media users, AEI's online magazine and blog are clearly two of its most popular tools for quickly disseminating information and encouraging public advocacy on behalf of certain laws and causes. *The American* was begun in 2006 and took the legacy of AEI's earlier print magazines online. It uses Rich Site Summary (RSS) feeds to push content directly to its subscribers. The magazine

mainly uses the form of news essays to provide more detailed accounts of various items that have recently been in the news, and to provide political analysis in line with AEI's research specialties. Articles range from foreign policy to monetary policy to popular sports. Many of the articles contain an element of advocacy and offer various policy prescriptions to problems with economic development, political disputes, or other issues. As is standard, each article can easily be shared on all the major social networking sites by readers, making it easier for a story to go viral. On the whole, the articles evidence a leaning toward fiscal conservatism, an emphasis on American interests in the conduct of foreign policy, and a strong focus on the economic implications of various regulatory policies. However, a look at the site's archive reveals that many articles express disagreement with both major U.S. political parties on a host of laws and issues, which burnishes the AEI and American.com's credentials as an independent think tank.

AEI's blog AEIdeas is another essential element of its social media strategy. Its daily traffic numbers are among the highest of any think tank, and testify that not only does the blog generate interest, but also readers return to it as a trusted source of information. Under the banner Freedom Opportunity Enterprise, the blog hosts a number of columns that are devoted to AEI's research divisions. There are also columnists who make regular contributions on dedicated pages. These articles are quickly searchable by topic and interest area. They are also written by people who are well-known area or issue specialists, giving them additional credibility. Subscribers to the blog can get daily updates on Afghan/Pakistani politics, U.S. economic policy, and a host of other issues tailored to their interests.

Its 75 years of traditional research and advocacy, or think tank, operations when combined with its formidable online presence featuring dozens of the most famous public policy analysts in the United States places the American Enterprise Institute in the clear position of one of the most influential think tanks in Washington, D.C., and one that looks likely to maintain this position for the foreseeable future.

Amplification

In the past two years, social media marketing has begun to focus on the concept of amplification. Amplification with social media involves taking some positive action or statement and then sharing it far and wide across social media platforms. Politicians have utilized such ideas in the past, but not in the concentrated way they are used through social media. If we look at George W. Bush's 2000 election strategy of enrolling volunteers to call their friends in support of his candidacy and then asking those friends to call 10 of their own, we see how word-of-mouth endorsements from individuals we already know can make for a successful campaign strategy. As a result of the new potential presented to amplify via social media, it is important to understand how it can become a politically viable means of quickly passing along information.

When purchasing ad space on any type of social media (Facebook, Twitter, YouTube, etc.), there is a limit as to how many ads a person can buy since he or she pays per click. On Google, for example, the purchaser buys per paid search; on Facebook, the buyer pays per display. But with social media, everyone that becomes involved in a person's particular network has a network of their own that their activities are shared with. So when John Doe "likes" a person's post, his network of friends is exposed to that person's post because of John Doe's action—and the person is not responsible for

paying for that. If John Doe has 1,000 friends or followers and combined they have 1 million friends and followers, a person's reach can exponentially grow from the actions of John Doe.

Amplification is the rate at which individuals who follow you take another individual's content and share it across their own personal networks. On Twitter, this focuses on retweets. Facebook and Google+ look at the number of shares per post. YouTube and blogs look at the number of share clicks per video or post. Analytically, the information gleaned from measuring amplification can be quite useful. First, one can determine what types of posts or videos are most likely to penetrate into one's second- or third-level network. Further, one can examine what times of day lend themselves to amplification, which can help shape one's social media scheduling. If one's messaging is truly successful, the hope is that one's network will grow as second-level individuals ultimately choose to become first-level supporters.

As amplification has become more widely recognized as an important social media metric, more sophisticated efforts at increasing amplification have been developed for various forms of social media. On Facebook—which has always presented the most opportunities for sharing and endorsing—Sponsored Stories have been created that allow companies to pay to repost any action an individual takes regarding them. These stories show up in the far right column of a person's friends' feeds, thus appearing as a personal endorsement from that person. Further advancements are permitting payers to place the sponsored stories directly into your Newsfeed. Twitter has a similar ability through the use of embedded tweets. This feature gives someone the option of embedding a tweet onto a Web site, consequently allowing followers to spread a message in other mediums.

From a political standpoint, we know that politicians have become increasingly curious about social media since Howard Dean's 2004 primary campaign and Barack Obama's successful utilization in both the 2008 and 2012 presidential campaigns. Through amplification, a message can reach a large audience very quickly at very little cost and lead to more first-level connections. The downside, however, that is largely ignored in the current literature is that as quickly as a candidate or campaign can share good news with

large numbers, others have the same capabilities to share bad news. Thus, the idea of amplification can work for or against a politician depending on the news being shared. While a campaign can control the content of information sent over social media from their own handle, they lack the ability to control whatever anyone else has to say. In this way, amplification has quickly become a double-edged sword for political consultants and politicians as unsatisfied citizens have the same tools at their disposal (although with a presumably smaller audience, at least initially).

Annette Strauss Institute for Civic Life

The Annette Strauss Institute for Civic Life aims to shed light on how new technologies of communication and innovative outreach can be used to increase political understanding and participation. Most of the institute's research efforts are therefore dedicated to applied research. Founded in 2000, the institution was named in honor of Annette Greenfield Strauss, a former Dallas

Student activists speak with an educator at an event in a series called "Why Bother? Engaging Texans in Democracy Today," cosponsored by the Annette Strauss Foundation in 2012 and 2013 to address low civic engagement in central Texas.

mayor, community leader, and philanthropist who devoted most of her life to helping others.

At the heart of the University of Texas at Austin, the institute is aligned with the university's public role of designing and testing new ways of increasing civic involvement. It benefits from the collective expertise of scholars who are nationally renowned for their contributions to the study and development of civic participation and the conditions that give rise to or suppress engagement. Through nonpartisan research, education, and outreach, the institute seeks to understand and overcome obstacles to civic engagement.

Programs and Activities

Among the current programs related to social media and politics, the institute's New Politics Forum is one of the most prominent. The forum focuses on engaging college-age adults by either providing the necessary skills to become effective as citizens, or by sharpening and honing their abilities and talents to take leadership roles in their communities. The New Politics Forum increasingly relies on social media tools to more efficiently communicate with its targeted audience, and to more readily engage youth in civic activities.

In fall 2011, the New Politics Forum organized the 21st Century Civic Engagement Conference, offering an overview of new online platforms that

citizens use to engage with politics and government uses to engage citizens. Based on the premise that there exists a new landscape in civic engagement, the focus of the conference was, in essence, how citizens can talk to each other to increase engagement and improve governing. Speakers from some of the most innovative efforts to use digital technologies to engage citizens (such as Code for America and SeeClickFix) discussed new platforms, social innovation, and global citizenship.

In spring 2012, the New Politics Forum hosted The White House Youth Town Hall in partnership with the White House Office of Public Engagement. The town hall focused on how young people can engage their government and each other to address community problems. This event leveraged several interactive technologies, including a statewide conference call, a moderated Twitter feed, and LinkedIn groups created during the town hall. Thereby, social media and communication technologies allowed viewing groups around the state to interact directly with Ronnie Cho (of the White House Office) and to discuss collectively through Twitter hashtags and LinkedIn groups the problems addressed by the event.

Every spring, the Annette Strauss Institute offers the Campaign Boot Camp, an intensive course on how to be effective working on political campaigns, and how to use social media for political organizing and mobilization. Also, the Executive Communication Training Seminar, usually offered once a year, always includes a component on social media. All activities organized by the institute encourage the use of social media, and engage external audiences by posting videos, uploading pictures, and using Facebook pages and Twitter hashtags to disseminate events.

Finally, the new initiative of the institute, called “Why Bother? Engaging Texans in Democracy Today” comprises a series of public dialogues and news stories produced in partnership with KUT Radio and KLRU-TV. This initiative is not aimed in particular at young people or college students, but instead at all citizens of central Texas, in order to discuss new forms of engagement, exploring ways to inspire more people to get involved.

“Why Bother?” has included an active social media presence. The most recent public dialogue, about how citizens can effectively engage state legislators, was also shown over Ovee (<https://>

ovee.itvs.org), a platform that allows for online interactive viewing with panelists chatting in response to viewer comments, including a “like” function. The goal is to let people have more than one option for engaging with events.

Research

The Annette Strauss Institute conducts research that furthers scholarly and public understanding of media, politics, and civic participation. In the field of digital and social media, there are several concurrent projects being conducted, one of the most prominent being the Engaging News Project. The goal of this project is to provide practical, research-based techniques for engaging online audiences in commercially viable and democratically beneficial ways. The project is directed by Natalie Jomini Stroud, associate professor of communication studies and assistant director of the Annette Strauss Institute.

Given the increasing influence today’s digital media landscape exerts over citizens’ civic lives, the Annette Strauss Institute recently housed and launched the new Digital Media Research Program (DMRP) led by School of Journalism Associate Professor Homero Gil de Zúñiga. This newly added research unit will develop a systematic research program generally aiming to address the influence of new technologies use in people’s daily lives, as well as the effect of such use on the overall democratic process. More specifically, the DMRP will shed light over the impact of new communication technologies use (i.e., social media), and user-generated content with respect to several benchmarks of a healthy democracy: citizens’ political knowledge, political discussion, and overall civic and political engagement.

Anonoblog

Blogs are conceptualized as tools that have been designed to promote immediate interaction between the host blogger and blog visitors. Blogs feature artifacts such as comments, trackback, blogrolls, and archives. Furthermore, blogging culture embraces a particular set of norms that encourage linking to other blogs and sharing via comments additional information regarding any subject being discussed. However, there has been an emergence of the anonoblog. The anonoblog, which is also referred to as a ghost blog, is an anonymous, easy-to-use publishing platform that arranges entries in reverse chronological order. This program is a simple content management system with a number of practical benefits, among them the automatic creation of Rich Site Summary (RSS) feeds so that readers can subscribe and get information automatically rather than visiting an actual Web site. The fascinating aspect about ghost blogging technology is that it allows anyone with Internet access to have a Web presence to create, publish, and update material on the Web without knowing HTML, CSS, PHP, XML, or any other programming languages. Therefore, if individuals can write e-mail messages, they have the ability to develop an anonoblog post; and many blogging programs actually allow an individual to post by sending an e-mail. However, anonoblogs are primarily characterized by a tension between ethics and identity.

Ethics

Contemporary media ethics scholars have discussed how new technologies have enabled deception. They have written about technologies such as very small recording devices that are easily hidden and digital editing technologies that make it easier to manipulate how information is presented and processed. The ability to verify what is true or factual in the blogosphere is threatened when opinion is misrepresented as fact, when bloggers plagiarize, when conflicts of interest are not disclosed, or when a blogger lies about his or her identity, especially when the identity of the blog host is not identified from the start. Furthermore, with the advent of Web 2.0 and applications that assist in facilitating interactions among users, increased collaboration and information sharing have raised more privacy concerns in relation to regulation and enforcement. Ethicists have discussed the potential of new communication technologies to threaten transparency and accountability. For example, the following considerations must be analyzed in relation to blogging and ethics; scholar Richard Johannesen notes the following in regard to ethics:

- What is the communicator’s intent, and what is the audience’s degree of awareness?
- Does the communicator use ghostwriters to make him or herself appear to possess personal qualities that he or she does not have?
- What are the surrounding circumstances of the communicator’s job that make ghostwriting a necessity?
- To what extent does the communicator actively participate in the writing of his or her own writing?
- Does the communicator accept responsibility for the message he or she presents?

Identity

Social media communications are rarely unilateral. Social media sites make it easy for people in vast geographical areas to leave blog comments, for example, sending Facebook or Twitter messages. As anonymity or pseudoanonymity are common online, it is not always possible for an individual to know where the initial communication originated

because the speed of this social networking system has the possibility to facilitate referrals, advice, and the formation of relationships with a few clicks of a mouse, and in this arena, casual interaction sometimes cannot be distinguished from more formal relationships. The frequent use of anonymity and pseudonymity online also can give rise to inadvertent conflicts of interest as bloggers unintentionally develop relationships with parties who have interests that are adverse to those of the initial blogger. For example, the initial blogger also may state a position on an issue that is adverse to the interest of another party and inadvertently create an issue conflict. Those most opposed to ghost blogging would argue that those who use the anonoblogging format should reveal their identities as much as possible (name, photo, background info, etc.), reveal their personal affiliations and conflicts of interest, and cite and link all of their sources referenced in each of their posts. In many social networks, this concept is still being negotiated.

Anonymous

Anonymous is an Internet meme that represents the concept of a decentralized online community acting anonymously—as an unnamed collective—in a coordinated manner, usually toward a self-agreed goal. In its early form, Anonymous was identified with a fringe group of law-breaking pranksters. The Anonymous collective has become increasingly associated with hacktivism—the use of computers and computer networks as a means of protest to promote political ends. It strongly opposes Internet censorship and surveillance, seeks mass awareness, and aids revolution against corrupt entities. For many, Anonymous has become the faceless face of the new cyberwar against oppressive governments and all-powerful corporations. Anonymous is responsible for raids, invasions, activism, protests, and public defamation via both legal and illegal means, with intentions both good and malevolent.

Anonymous's origin is attributed to 4chan.org, an English-language image board that started in 2003. Unlike many Web forums, 4chan does not have a registration system. Blog entries, files, and information are posted anonymously; posts are signed with the Anonymous moniker, and the pseudonym Anonymous is used during chats. The general understanding on 4chan is the term *Anonymous* does not stand for a single person but rather a collective of unidentified users. In 2006, the Anonymous meme emerged on 4chan from this idea of a collective of unnamed individuals with a shared identity.

Anonymous now consists of users largely from multiple image boards and Internet forums. Several wikis and Internet relay chat (IRC) networks, such as AnonOps, AnonNet, or Voxanon, are maintained to overcome the limitations of traditional image boards. The group is banded together by the Internet through 4chan, 711chan, Encyclopaedia Dramatica, IRC channels, YouTube, and Facebook.

Anonymous has no leader, no ranking or controlling party, and relies on the collective power of its members—Anons—acting in ways that benefit the group. An image commonly associated with it is the suit without a head, representing a leaderless organization and anonymity. Anybody who wishes to join can be an Anon and work toward a

Protesters wearing the Anonymous group's iconic Guy Fawkes masks at a demonstration against the Church of Scientology in Los Angeles, California, on February 10, 2008. The 2008 demonstrations were the group's first mass protests in the physical world and involved thousands of people in North America, Europe, New Zealand, and Australia gathering in front of Scientology churches.

set of goals. Anonymous contains a wide range of beliefs and lifestyles spread over many media and languages. The views of the loudest members of Anonymous are not necessarily the views of the rest of Anonymous. Members usually have agendas all agree on and coordinate and act upon, but all act independently toward them.

One of the trademark symbols associated with Anonymous is the Guy Fawkes mask, which is a stylized depiction of Guy Fawkes, the best-known member of the Gunpowder Plot, an attempt to blow up the English Palace of Westminster, London, in 1605. The mask portrays a white face with a subtle smile and red cheeks, a wide moustache upturned at both ends, and a thin, vertically pointed beard. In late 2006, stick-figure comics depicting a character bound to fail at everything started to appear on 4chan and became known as Epic Fail Guy (EPG). On September 30, 2006, a thread was posted in which EPG found a Guy Fawkes mask similar to the one in the movie *V for Vendetta*. Thereafter, many EPG threads appeared depicting him with the mask. Anonymous's

preference for the Guy Fawkes mask is believed to have grown directly from the EPG meme.

In 2008, Anonymous launched Project Chanology, a protest movement against the practices of the Church of Scientology, its first widely noted raid and first protest in the physical world. This started in response to the church's attempts to remove material from a highly publicized interview with Scientologist Tom Cruise from the Internet, claiming it was unfairly edited to misrepresent the religion and was intended only for current members of the church. On January 21, 2008, Anonymous responded with a YouTube video, *Message to Scientology*, showing it views the church's actions as Internet censorship and asserting its intent to expel the church from the Internet. It stated, "We are Anonymous. We are Legion. We do not forgive. We do not forget. Expect us." Also, thousands of protesters took to the streets in North America, Europe, New Zealand, and Australia in front of Scientology churches. As part of Project Chanology, many Anons sported Guy Fawkes masks to draw

attention to their identity as Anonymous as well as visually telling Scientology it was an “epic fail.” Anonymous has since adopted the Guy Fawkes character for its wider protests against authority.

In its initial years, Anons gathered in virtual space created by IRC, where they discussed technology, politics, and activism, sometimes with a dose of sexual banter and lulz, a play on LOL—laugh out loud—that describes the thrill of mischievous and even nasty pranks. With high-profile campaigns centered on distributed denial of service (DDoS) attacks that knock target Web sites offline, Anonymous then transformed into an international movement that draws new recruits by the thousands. Operation Payback was launched in 2010, and one of its extensive, collective operations involved a series of DDoS attacks targeting companies that cancelled services to the whistle-blowing Web site WikiLeaks, including PayPal and MasterCard.

Today, Anonymous’s rapid rise to becoming a catalyst and nerve center for real-life revolutions has taken even some of its own members by surprise. Tunisian Anons collaborated with their international counterparts on Operation Tunisia, launched on January 2, 2011, well before most Western media outlets realized there was a revolution underway in the Arab world. Anonymous launched a series of DDoS attacks against Tunisian government Web sites. Additionally, Anonymous provided protesters with documents required to take down the incumbent government and distributed a care package, translated into Arabic and French, offering cyberdissidents advice on how to conceal their online identities to avoid detection by the regime’s cyberpolice. They also aided in passing information about the protests in and out of the country. After Tunisia, Anonymous’s interest in the wave of protest movements in other Arab world countries, such as Libya, Algeria, and Egypt, did not wane.

Antibullying Efforts

In late 2012, Anonymous voiced support for victims of nonconsensual pornography or “revenge porn.” Hunter Moore, considered a revenge porn entrepreneur, and dubbed “the most hated man on the Internet” by *Rolling Stone* magazine, created his now-defunct Web site, Is Anyone Up, in 2009. It bared revealing photos and videos of

people linked to their social networking profiles, thus exposing them to unwanted publicity and large levels of abuse. This explicit private material that had once been captured during intimate moments appeared on Moore’s site as form of “revenge.” Though this Web site attracted a great deal of attention, some salacious and mostly condemnatory, Moore trolled critics and rarely took legal complaints seriously. After facing legal trouble he shut down Is Anyone Up, only to go bigger and bolder with a new site, HunterMoore.tv, that not just published nude photos of private citizens but also offered details of where they lived.

In reaction to this, Anonymous launched a campaign against Moore—to hold him accountable and protect those victimized by this sort of cyberbullying. Using the method of doxing—getting information about an individual using the Internet and social engineering techniques—Moore’s personal information, such as Social Security number and home address, was published in a Pastebin doc as part of #OpHuntHunter, an offshoot of the antibullying operation #OpAntiBully. Anonymous initially launched #OpAntiBully as a response to the suicide of Amanda Todd, a 16-year-old Canadian teen who took her life after years of being bullied online.

Anonymous also took down HunterMoore.tv via a denial-of-service attack; they hacked into Moore’s servers and defaced the site. Additionally, Anonymous published a second Pastebin doc that includes a link to Moore’s FTP site, which he uses to upload files to HunterMoore.tv, and his login information. Anons also compromised Moore’s SoundCloud account and registered a premium product with his credit card information.

Criticism

Anons have been called criminals and terrorists; many traditional activists have criticized Anonymous for its methods. Also, for Anons, personal privacy is not always sacred, as the public punishing of security firm HBGary in February 2012 demonstrated. The firm’s Web site was defaced, and Chief Executive Officer Aaron Barr had his social media accounts hijacked and personal information leaked online, all in retribution for threatening to reveal the identity of leading Anons.

Yet, there has never been, nor has a desire been expressed for a large-scale diabolical Anonymous

operation. Rather, using tools of disruption and spectacle, Anons may have unwittingly redefined civil disobedience for the digital age. In the electronic landscape that has exploded with largely unchecked intrusion and surveillance, many social media scholars and practitioners argue that Anonymous has made the case for “anonymity,” although many others maintain that the group may have outlived its useful function in bringing a healthy dose of anarchy to the online political landscape. In either event, the organization reminds the digital public, on a regular basis, of the need to revisit and perhaps reinvent the very concept of “privacy” in the new media environment.

Antibullying Campaigns

Bullying is the use of influence or power to degrade others, sometimes with the intent of

forcing the object of bullying into changing a specific behavior. When it migrates to the ubiquity of social media, bullying can have a political as well as a social component. Research shows that those being bullied are more likely to skip school or avoid work, may find it difficult to concentrate on schoolwork or work-related tasks, are more likely to use drugs or alcohol, tend to have more physical health problems, have lower self-esteem, and may even be likely to bully others when they feel they are in power. Many people tend to characterize bullying as an intentional act, but many who are enacting bullying behaviors do not realize that they are bullying. Bullying is also social, and so those who are not directly enacting the bullying behaviors do not realize that they are often perceived as a negative part of the bullying experience, too. Unfortunately, if someone confronts a bully’s behavior, then he or she risks being bullied in retaliation.

As digital technologies have continued to allow personal information to be spread to more people more quickly, perhaps not coincidentally, bullying behaviors have received increased attention from traditional media outlets, concerned parents, education administrators, and the public at large. Given that social media may have allowed bullying behaviors to be more prevalent and accessible, it is appropriate that many social media campaigns have been formed to combat bullying—usually bullying that is aimed at children or young adults. These campaigns often embrace multiple platforms including Facebook, Twitter, YouTube, e-mail, and interactive Web sites. Even campaigns that are not facilitated through social media outlets often include social media awareness and education as part of their aims.

Cyberbullying

Many antibullying campaigns have given special attention to cyberbullying, or bullying that happens through social media sites, via text messaging, or even by means of specially created Web sites. Cyberbullying has allowed bullying behaviors to be more pervasive, as what was once limited to face-to-face interaction with a bully or bullies is now less restrained as to when and how the bullying can happen. In addition, digital technologies allow for messages to be sent more quickly and for new forms of bullying to happen,

such as the digital manipulation of a photo. Messages or images that were meant to be personal can also be used by bullies to control or humiliate an individual.

Once bullying behaviors are enacted online, they also become more difficult to control. Whereas teasing or taunting is somewhat ephemeral in nature, once a picture is distributed or a hateful remark posted in a public forum, it may be impossible to stop the picture or message from being further distributed by others. Cyberbullying also has the potential to be anonymous, something that might make a bullied person feel insecure and afraid, and something that may make it difficult for parents, authority figures, or law enforcement to intervene. Because it can be so difficult to confront bullying behaviors or to identify those who are bullying, many antibullying campaigns have been aimed at understanding and prevention. Others have focused on providing emotional support for victims of bullying.

It Gets Better Campaign

Probably the best known antibullying movement is the It Gets Better campaign. In response to a large number of suicides related to young people being bullied for being perceived as lesbian, gay, bisexual, or transgender (LGBT), media personality Dan Savage and his husband, Terry Miller, created the campaign in 2010. Initially, the campaign featured a YouTube video calling for LGBT individuals to share how their lives got better after they left bullying environments. Within the first week of the campaign, more than 200 inspirational stories were posted in response. By the end of the second week, the YouTube channel associated with the campaign reached its 650-video limit. Soon, a Web site was created, the It Gets Better Project, which eventually hosted 30,000 entries from individuals with a variety of backgrounds and across diverse genders and sexual orientations (including individuals who identified as straight).

More than 40 million viewers have watched It Gets Better videos, and the Web site received the Academy of Television Arts and Sciences Governor's Award at the Creative Arts Emmy Awards ceremony in 2011 in honor of the campaign's use of media to educate and inspire others. President Barack Obama created a video for the site, as have a variety of other politicians, celebrities, and

personalities, including Kermit the Frog. Though it originated in the United States, the campaign has found success in several countries on five different continents. The campaign seems to have inspired other campaigns that confront bullying on a more general level, such as the Sears Team Up to Stop Bullying Project and the I Choose Anti-Bullying Campaign. Much like the It Gets Better Campaign, the projects use Web sites to provide information and educational resources to help confront bullying as well as personal stories of being bullied.

Stopbullying.gov

Another popular antibullying campaign is the U.S. Department of Health and Human Services platform stopbullying.gov. The Web site is especially aimed at the bullying of schoolchildren. In characterizing bullying, it points to aggression, power imbalance, and specific behaviors such as threats, rumors, physical and verbal attacks, and exclusion. It is careful to separate bullying from behaviors such as stalking, hazing, or other aggressive behaviors that may not necessarily involve bullying. In addition to tips for interacting with children, parents, teachers, and school officials about bullying, the Web site also offers extensive considerations about preventing cyberbullying behaviors.

In particular, it suggests that parents be aware of the Web sites their children visit and other online activities they engage in. It also warns that parents should not avoid the social media platforms and online domains that their children use, even if they are not of interest. Having a sense of how such Web sites or platforms work and what they contain or facilitate can help a parent to contextualize any talk about interaction that may take place via the outlets. The campaign also suggests that parents ask their children for any online passwords, promising to use them only in an emergency. Parents are also encouraged to friend their children on Facebook and to follow them on Twitter so they know what kinds of online behaviors are happening. Some children fear that, if their parents know about others cyberbullying, their parents will become upset and take away online or mobile device privileges even if the children are not directly involved. Parents are encouraged by the stopbullying.org campaign to tell their children

that they always want to know when someone is being bullied and that they will not take away any privileges if such behavior occurs.

Born This Way Foundation

In addition to celebrities contributing to antibullying movements through videos or promotional appearances, some have made more enduring contributions. Perhaps the most notable of these is the Born This Way Foundation (BTWF). Founded in 2011 by popular musician Lady Gaga and her mother, Cynthia Germanotta, the organization has a mission of inspiring youth and building supportive communities. The title of the organization coincides with the title track of Gaga's *Born This Way*, an anthem that encourages individuals to accept and celebrate their diversity. BTWF is a partnership with the Berkman Center for Internet and Society at Harvard University, the California Endowment, and the John D. and Catherine T. MacArthur Foundation. It was also established with the help of media personality Oprah Winfrey. Although helping the bullied is a big part of its mission, the Web site and accompanying social media features are also used to boost the self-esteem of potential bullies so as to minimize the need to judge or pick on others and to encourage general acceptance. The organization has won awards including the LennonOno Grant for Peace from Yoko Ono, demonstrating again its widespread support.

Rankism and Workplace Bullying

While the It Gets Better, stopbullying.org, and Born This Way campaigns work to stop bullying aimed at children, teenagers, and traditional college-aged students, other campaigns offer support and interaction specifically for adults. Although social bullying is something that may happen to an adult, many times the bullying that occurs will be as part of his or her work life. Sometimes, this bullying happens from a superior in a work situation. This is often referred to as rankism, or an individual using superior rank to manipulate, punish, or humiliate someone. When peers in a work environment bully each other, that is often referred to as workplace bullying. Many times, this bullying happens when an individual feels as if he or she is being blocked from a professional goal, although it may happen for other reasons as well.

Although social media campaigns to prevent or correct bullying situations at work are not as widely known as those that are aimed at helping youths, many options are available. For example, the Workplace Bullying Institute offers a Facebook page, interactive blog, and Web site to help individuals (both employers and employees) navigate bullying situations. The Facebook page allows users to post educational videos about identifying and dealing with bullying, inspirational quotes or graphics that encourage people to keep positive attitudes if they are being bullied, and links to other resources about bullying. The Facebook page also provides information about the development of antibullying laws in workplaces and allows participants a space to tell their individual stories. The interactive blog provides news stories and opinion pieces, sometimes illustrated with YouTube videos or enhanced by links, to further information, and users can respond to the blog posts and discuss them with each other.

Effect

Although antibullying campaigns have been effective at raising awareness about bullying and helping individuals to respond to bullying behaviors, critics have warned that antibullying campaigns tend to deal with proactive bullying, or bullying that is premeditated and intentional, rather than reactive bullying, or the kinds of bullying that emerge out of heated interactions. Specifically, individuals might be taught that bullying is wrong and warned against picking on others or trying to make others feel bad about themselves, but such teachings do not necessarily recognize that, when someone is interacting with others and not getting what he or she wants, more temporary bullying behavior may emerge until he or she is satisfied. Because this kind of bullying is more of the moment, it may be harder to recognize and correct.

Antibullying campaigns enacted through digital platforms have been particularly effective at moving the focus of bullying from punishment to prevention, even if there is much work to be done. Being caught in a moment of bullying can be awkward and humiliating, whether one is being bullied or observing it. Antibullying campaigns have instilled a stronger sense that what is happening should not be the norm and that bullying behavior is wrong. In addition to sensitizing

people toward recognizing the behavior, antibullying campaigns also help individuals to develop empathic skills to consider how others may feel in bullying interactions. Even when watching videos such as those in the It Gets Better Project, where individuals being bullied are encouraged not to take their own lives and to look forward to a brighter future, viewers of the videos will likely come to see those who are targets of bullying as feeling human beings. Unfortunately, antibullying campaigns have yet to develop effective ways of correcting bullying that go beyond punishment of the bullying individuals. That limitation is not so much a result of ineffective campaigns but rather a lack of development of research regarding how bullying interactions can be prevented.

Antislavery Campaign and Social Media

There are an estimated 27 million slaves around the globe, many of them victims of human trafficking within national borders or internationally. They

are forced into agricultural fieldwork, mining, the production of over 100 everyday consumption items, or sex trade. As Kevin Bales states, they are "disposable people," who are bought and sold, exploited and coerced, often subject to brutality and violence, and paid little to nothing for their servitude. Given the magnitude of the problem, in the past several decades numerous organizations and individuals have been engaged in antislavery and antitrafficking campaigns intended to raise awareness and identify solutions. The Internet and more recently social media have been instrumental in such campaigns.

An array of scholars and activists have highlighted that, unlike antiquated versions of slavery that entailed legal ownership of humans recognized by certain governments, the contemporary variant of slavery is deemed illegal by governments worldwide that no longer permit one individual to claim ownership over another. This legal framework that criminalizes slavery is grounded in fundamental human rights principles, yet in the lack of a viable set of practices to reinforce the principles it benefits slaveholders rather than slaves. Without legal recognition and government oversight, slaves remain as much outside of the rule of law as slaveholders, and thus the precarity of their livelihoods and the threat against their lives increase, whereas the possibility of tracing them and the capacity to offer help to them decrease.

Because of such circumstances, present-day slaves are often hidden in plain sight. Emma Thompson became involved in the antislavery cause after she found out that a young woman named Elena had been held as a sex slave in a massage parlor a few blocks away from the actress's residence in London. Elena was smuggled from Lithuania into England with the promise of a service job, but instead she was sold to sex traffickers and forced to serve 20 to 30 clients a day. Many slaves are held in locations as visible as the one where Elena was held yet remain as invisible as Elena was. They are often women and children, and often migrants, and they become slaves because they are given away by a spouse or a parent for money, are lured with promises of a better life, or are kidnapped.

Antislavery Groups

National authorities are primarily in charge of protecting the human rights of their residents; however,

the global nature of contemporary slavery and the previously described legality issues leave many governments incapacitated in this regard, whereas red tape and corruption within many governments on all continents only add to the problem. Under these circumstances, the involvement of international bodies as well as of grassroots groups is key for endeavors against slavery.

In 2007, the Global Initiative to Fight Human Trafficking (GIFT) was launched by a partnership formed of the International Labor Organization (ILO), the Office of the United Nations High Commissioner for Human Rights (OHCHR), the United Nations Children's Fund (UNICEF), the United Nations Office on Drugs and Crime (UNODC), the International Organization for Migration (IOM), and the Organization for Security and Cooperation in Europe (OSCE). This initiative strives to create a multistakeholder strategy, which builds on national efforts throughout the world, by means of providing technical assistance and promoting effective responses.

Additionally, advocacy groups such as the U.S.-based Alliance to End Slavery & Trafficking (ATEST) or the United Kingdom-based Helen Bamber Foundation, and political and artistic personalities from Hillary Clinton and Barack Obama to Angelina Jolie and Ricky Martin, have generated and supported antislavery and antitrafficking discourses and activities. For example, ATEST has sponsored a Modern Day Slavery Museum, a mobile exhibition that allows visitors to interact with the reality of slavery in the Florida tomato industry, and the Helen Bamber Foundation has sponsored the Everyday Project, a live broadcasting of musician Phil Knight's two weeks of solitary confinement inside an iron-clad shipping container that resembles those in which many slaves are transported. Celebrity power has helped reinforce appeals to citizens and civic groups to be mindful of the existence of contemporary slavery and to join the cause of stopping slavery.

Social Media

New technologies and new media have been important aides for such initiatives and activities, which have been publicized through Web sites and blogs and more recently through social media such as Facebook and Twitter. The Web sites of GIFT and ATEST provide visibility to these

entities and resources for antislavery advocates. The Web sites and Facebook pages of other global antislavery groups such as Anti-Slavery International and The No Project add research support and artistic expression to the efforts against slavery. A well organized Web site, containing action tools, an activist map, and a resource library, as well as a strong presence on Facebook and Twitter, are contributing to the success of another growing global antitrafficking coalition, Stop the Traffik, which tries to involve businesses, charities, faith groups, schools, universities, and community groups in the attempt to combat contemporary slavery. The Products of Slavery Web site offers an interactive map, locating items produced through forced labor and outlining statistical data related to these items, as well as a shopping hub, sharing opportunities to purchase products that have not been made by using forced labor. The Teens on Trafficking Web site is aimed at educating teens about the dangers of becoming enslaved by means of Internet safety tips, movie and link lists, and testimonies from teens, as well as by encouraging teens to take a stand against slavery. The Free the Slaves (fts) blog comprises an array of documents including rescued slave stories, policy proposals, and information about antislavery actions and tools.

The antislavery interactive art exhibit in New York titled *The Journey*, cocurated by Emma Thompson, as well as the antislavery concept music album *Just Enough for the Real World*, coproduced by Emma Thompson, were made widely known through various Web sites, the fts blog, and several powerful public service announcements featuring the actress and posted on YouTube. Phil Knight's solitary confinement also turned from a local event into an international one through live video streaming on the Just Enough for the Real World Web site.

The Internet and social media can provide not only opportunities for international organizations and national bodies to coordinate their actions against slavery and trafficking, but also for regular people to contribute their capabilities to fight these problems. In an article published in *The Judges' Journal* in 2013, Judge Herbert B. Dixon, Jr., shares a case in which crowdsourcing through social media networks functioned as a technique of rescuing people under threat of becoming slaves. In

2010, an antislavery activist was made aware that two women from Russia traveled to the United States after one of them had paid approximately \$3,000 to an exchange program for a promised job in Washington, D.C. The activist learned that the exchange program contact changed the details and directed the women to travel to New York for work as hostesses at a lounge.

The activist suspected the two women were being lured into a human trafficking operation, but as he was unable to convince them not to travel to New York he posted an online plea to an anti-slavery discussion group describing the situation and asking for help. Within minutes, discussion group members offered information and support, called human-trafficking hotlines and the Russian embassy in Washington, D.C., offered places for the women to stay, researched the travel agency and the lounge where the women were promised work, and volunteered to meet them at the bus depot. One member of the discussion group met the women at the bus depot in New York and ultimately succeeded in convincing them to not meet the exchange program contact.

As Judge Herbert B. Dixon, Jr., asserts, such a massive mobilization of non-law enforcement and nonmilitary personnel in numerous locations in such a short interval to assist and protect these two traveling women would have been impossible without the Internet and access to an online discussion group. In this case and in similar cases, the Internet and social media can foster alliances between individuals and groups interested in making slavery truly a thing of the past.

Antiwar Protesting

Antiwar protesting is any form of expressed opposition to a state's explicit declaration of war or threat of impending war. Protests can include tactics ranging from public education and debate to sabotage, assassination, and self-immolation, as well as conventional political activity such as direct action and civil disobedience. Marches and protests have become one of the major forms of antiwar protesting because they provide a demonstration of the social movement's legitimacy, unity, size, and commitment. Additionally, they create an oppositional consciousness and solidify

activist identities through the creation of an “us-versus-them” mentality.

History

Antiwar protesting is a separate phenomenon from the larger “peace movements,” which have a more expansive goal of ending war in general and promoting world peace. Antiwar protesting has its roots in historic peace churches such as the Quakers, the Church of the Brethren, and the Mennonites, which advocated peace as part of a larger faith-based platform. In the United States and Britain, the antiwar position began to grow between the War of 1812 and the Civil War, resulting in many propeace publications during this time, as well as speakers and politicians publicly advocating abstention from war. Several riots also occurred in response to Abraham Lincoln’s attempt to draft citizens to fight in the war.

With the dawn of the 20th century and the impending World War I, a growing antiwar sentiment in the United States began to manifest itself. Started by groups such as the U.S. Fellowship of Reconciliation (FOR) and later spearheaded by the Socialist Party of America, led by Eugene Debs, the antiwar protests in the United States took place both through public media channels and through direct action. Socialists banded together with labor activists and anarchists to spur protests and riots opposing the war, claiming that the war was an affront to the “working-man,” who was being used to protect the interests of wealthy manufacturers.

The anti-World War I sentiment also saw the beginnings of the conception of antiwar protests as part of a global movement. Where previous antiwar protests would take the form of appeals to the host state, protests against World War I took place across international borders. FOR was one group to begin this process, sending delegates to other countries and meeting with other antiwar advocates to promote peaceful relations. Likewise, the Socialist Party saw the workingman on each side of the conflict as part of the same system of oppression.

After World War I, groups such as the Women’s Peace Union (WPU) protested war within the governmental system, lobbying Congress to outlaw war, and organizing antiwar demonstrations, marches, and meetings. Other groups like the War Resisters League encouraged people to “register”

for peace instead of registering for military service. This era of antiwar sentiment also saw the rise of the America First Committee, an antiwar organization that had the largest registered membership ever in the United States. Where the antiwar protests during World War I had a global focus of creating peace between international entities, the U.S. antiwar movement between the world wars attempted to foster an isolationist attitude, advocating peace while also advocating noninterventionist policies.

Once the United States entered World War II, vocal opposition to war declined though it was not erased entirely. With the dropping of the atomic bomb, antiwar discourse began to focus on how to deal with nuclear weapons. Antiwar groups were not explicitly against nuclear weapons: they instead advocated public education programs. There was little agreement as to what type of policy should be put in place to deal with these weapons. Some groups argued for disarmament, others for an international system for controlling the weapons, and still others wanted two superpowers to control the weapons.

Protests at this point took place through public discourse and education programs, as well as individuals as a part of the system providing some pushback. Scientists working on the bomb attempted to share technical information with their allies to reduce the threat of a single nation wielding the weapon for its own purposes. Other activists such as United World Federalist cofounder Cord Meyer, Jr., even went so far as to join the CIA in an attempt to promote peace from within. All of these protests, however, met with opposition in the form of a growing Cold War and McCarthyist fear of security and any form of action that could be taken as “anti-American.”

At the end of the Korean War and the subsequent censure of Senator Joseph McCarthy, a space for debate opened up and government policies could be questioned much more easily. Appeals to the U.S. government came not only internally, but also through international channels such as marches staged by the British Campaign for Nuclear Disarmament and statements by Pope Pius XII, Jawarharlal Nehru, and the British Labor Party. Public demonstrations, education campaigns, and civil disobedience culminated in government officials investigating the possibilities of a ban on testing nuclear weapons.

Once the Test Ban Treaty was ratified in 1963, the focus on regulating nuclear arms began to shift. As U.S. involvement—and the resulting media images of deployed troops and casualties—in Vietnam in the 1960s increased, so did antiwar sentiment. College campuses began as a locus of this sentiment, housing the vehemently antiwar Students for a Democratic Society (SDS). SDS began by mobilizing college students and advocating tactics of civil disobedience. This included draft-oriented methods of protest: refusing to register for the draft, burning draft cards, or fleeing the country to avoid the draft. More radical methods that often included violence, such as attacks on selective service centers to disrupt drafting, were also carried out. Additionally, SDS organized massive teach-ins and protests that would rally large numbers of people.

The protests against Vietnam proved to have more of an effect on policy than many previous protests. By creating a coherent and visible opposition to the war while simultaneously engaging in actions that increased the cost and difficulty of recruiting people to fight the war, the protests help draw attention to U.S. foreign policy. Eventually this scrutiny led to the withdrawal of troops; it also resulted in “Vietnam syndrome,” political and public discourse emphasizing a less interventionist foreign policy and more widespread acceptance of peaceful means of negotiating in place of war. When the Vietnam War ended in 1975, active protests began to dissipate, but the movement left behind many groups that could be easily mobilized when necessary.

At the outbreak of the first Persian Gulf War as a response to Iraq’s invasion of Kuwait in 1990, groups left over from the Vietnam era mobilized to articulate an antiwar response. Because of this networked system between activist groups, demonstrations on both the local and national levels were organized before forces were deployed. Where previous protests had been largely in response to military operations already in place and a current or inevitable war, the protests against the Persian Gulf War were pre-emptive and sought to defer full-scale military action in favor of economic sanctions.

Lessons from the Vietnam War protests were also put into practice by the government. In anticipation of the mobilization of activist groups and

Antiwar protests in the United States diminished after President Barack Obama’s 2008 election, but still occur. These protesters wore the Guy Fawkes masks of the Anonymous group at an antiwar rally in New York City on April 9, 2011.

widespread demonstrations, the George H. W. Bush administration carried out the war in a way that did not appear unilateral by bringing in European allies, as well as using a large-scale deployment of troops to minimize U.S. casualties and make the war as brief as possible. Where Vietnam resulted in prolonged engagement and, consequently, allowed time for antiwar sentiment to grow and manifest through demonstrations and actions, the actual full-scale war part of the Persian Gulf War was conducted in little over a month, not giving the antiwar movement enough time to generate widespread opposition.

The next decade saw a continued decline in antiwar protests but, as with the end of the Vietnam War, activist groups continued to operate and exist within a network that allowed large-scale demonstrations and actions to be put together quickly. The threat of military action by the United States in Afghanistan proved to be the catalyst that pulled together these networks in expressions of coordinated action.

Afghanistan and Iraq

As with the Persian Gulf War, demonstrations against the Afghanistan War began to occur before the U.S. military actually invaded Afghanistan. The protests were “antiwar” in the sense that they advocated the use of nonviolent means of negotiation, rather than opposing a current war. Protests against the Afghanistan War proved to be much smaller than those of Vietnam and were quickly put down in the presence of both domestic and international support for the war stemming from the September 11, 2001, attacks on the World Trade Center. Additionally, the antiwar movement did not have many allies in top-tier political positions and there were no apparent political divisions that could be exploited over whether or not to go to war.

Though the antiwar protests surrounding the Afghanistan War were brief, actions in opposition to the Iraq War were more widespread due to a more questionable reasoning for military action. These protests, along with others that occurred before and during the invasion of Iraq, did not explicitly prevent or shorten the war. They were, however, able to put pressure on the governments involved in waging the war so that they became politically cautious.

The actions against the Iraq War also saw an increase in global coordination between activist groups. Protests were not only organized along regional and national levels, but also on international levels. International protests for U.S.-led wars had occurred previously, but the Iraq War protests were unique in that they created large-scale, simultaneous actions around the globe. February 15, 2003, saw the largest protest in history, a synchronized demonstration that took place in over 600 cities and 60 countries in the face of an impending invasion of Iraq, which would occur a month later on March 20, 2003. Millions of people were involved and some of the largest numbers came from European cities, though they were protesting an American war.

The Afghanistan War protests found a new articulation of how protesters identified themselves as part of a global consciousness. Where pre-Vietnam protests focused on whether the United States should pursue isolationist policies and Vietnam-era protests focused on the draft and U.S. foreign policy, the Afghanistan War

protests began to show the emergence of a global consciousness and an appeal to a sense of belonging to a global community that possesses fundamental rights and suffers common injustices.

New Technology and Social Media

In opposition to both the Afghanistan War and the Iraq War, new technologies allowed for an ease of organization unparalleled in previous spikes in antiwar protests. The Internet has broadened the reach of communications, allowing international organization to take place more easily and for more politically empowered groups to reach out to less developed groups in other countries. Additionally, the Internet and the World Wide Web have allowed groups to disseminate information and create a political structure focused on grassroots activism and identification with a global sense of justice that has multiple and flexible interpretations, where previous activist organizations have had to rely on tapping into potential participants' identification with class struggles and issues.

Contemporary networks of communication have also allowed protests to include the sharing of stories and information from the soldiers themselves. Though not the politically tied allies of before the 21st century, these soldiers have provided a weight and legitimacy to activist groups and have articulated an antiwar position rooted in firsthand experience. Moreover, by bringing the soldiers themselves into the collective identity of antiwar protesters, family members and other traditionally prowar but nonmilitary individuals are also brought into the fold.

The incorporation of technology into protest has also been criticized as creating isolated groups that encourage pre-existing ideas rather than bringing in new members. Listservs and message boards have the dual danger of attracting only individuals who already agree with the positions advocated and of creating a system that installs new forms of control through moderators and list managers who can censor undesirable opinions. This results in the closing down of a public space for debate. It has also led to “slacktivism” whereby individuals can share information via social media instead of participating in demonstrations and marches.

Even with the possibility of congealing pre-existing, radical opinion, the scope of potential

antiwar protest participants did expand during this period. Where Vietnam-era protests were primarily led by the radical left and student organizations in the United States, protests of the early 21st century have attempted to appeal to people with diverse cultural, ethnic, and national backgrounds, as well as members of mainstream society who were not particularly politically radical. This has resulted in protests gaining more credibility, legitimacy, and support than many pre-21st-century protests.

With the election of Barack Obama in 2008, antiwar protests have begun to subside. Speculation as to the cause of this is varied. Some believe that the perception of Obama as a liberal have overshadowed the reality of his prowar stance. Others have posited that the lack of a draft has caused the war to be felt less in the United States and other countries, failing to spur the same response that Vietnam did. Still others have pointed to the large amount of money that the defense industry pours into various communities through government contracts as a reason why people are reluctant to speak out against the war. In each case, direct action and marches have gone by the wayside, but the activist networks and global connections fostered in recent years have held, and protest in the form of written and spoken criticism has not disappeared.

Apple v. Does

Apple v. Does (O'Grady et al. v. Superior Court, May 2006) was a California Court of Appeal case that dealt with the scope of journalistic shield laws and whether those laws applied to "online" journalists involved in the unauthorized disclosure of corporate trade secrets. The appellate court, reversing the decision of a Santa Clara County Superior Court trial judge, held that trade secrets do not fall outside the protections of the First Amendment, that there is no substantive distinction under the First Amendment between print and Internet journalism, and that Apple's attempt to subpoena the identities of the journalists' sources violated the Stored Communications Act.

The petitioner, Jason O'Grady, owned and operated "O'Grady's PowerPage," which was described as an "online news magazine" that focused on information about Apple computer products. O'Grady, along with the unidentified publisher of Apple Insider, another Apple online news magazine, published a number of articles in 2004 about an upcoming Apple product release called Asteroid or Q97. The new item was a FireWire breakout box for GarageBand that allowed users to produce digital audio recordings. The articles included diagrams of the device and details about its functionality. The articles were published under pseudonyms by several different authors.

Apple filed a complaint against the unidentified Web authors, claiming that they had illegally published classified trade secrets without Apple's authorization. According to Apple's attorneys, the descriptions and diagrams of the new product were very similar to internal presentation files at Apple, with the exception that the statement "Apple Need to Know Confidential" had been removed. Apple also sought subpoenas to compel the publishers to disclose the names of the individuals who had provided the unauthorized information.

O'Grady and the other petitioners responded by seeking a protective order against Apple's

discovery. They argued that the identities of the sources were protected under the California Constitution's reporter's shield, that the sources were further safeguarded under the First Amendment's protection of reporter's privilege, and that the sources could not be disclosed without violating the Stored Communications Act. Apple's attorneys responded that reporter's privilege did not apply to trade secret infringement and that the California reporter's shield was not applicable to requests for discovery or to anonymous speech on Internet Web sites, which did not constitute journalism. The trial court found in Apple's favor and denied the petitioners a protective order. O'Grady and the others then appealed to the California Court of Appeals.

Appeal

In reversing the decision of the trial court, the Court of Appeal began its decision with a review of the Stored Communications Act (SCA). According to the Act,

... a person or entity providing an electronic communication service to the public shall not knowingly divulge to any person or entity the contents of a communication while in electronic storage by that service.

The SCA, however, contained exemptions that could be applicable to the case. One of these exemptions was that disclosure was authorized to protect the rights or property of the service provider. According to Apple, the noncompliance with the subpoenas would subject the service providers to legal action by Apple, which represented a threat to the providers' rights and property. Compliance would, therefore, be the only way of ensuring that their rights and property were safeguarded.

The Court of Appeal rejected Apple's argument. Noting that the failure to comply with the subpoenas could incur costs to the service providers, this did not constitute a substantive threat to either rights or property. As businesses, the service providers were perfectly free to choose whether they wanted to undertake action that either increased or avoided such costs, choices that businesses must make every day. The fact that pending legal action necessitated such a choice did not

mean that the businesses' rights or property were being threatened. Moreover, the language of the statute made clear that the judgment about the threat to rights or property rested with the businesses, not with Apple. The Internet providers could request that the exemption be invoked, but Apple could not impose the exemption on them. If the Internet providers believed that the exemption did not apply, then they needed to comply with the language of the act and protect the identities of sources of communication.

The Court of Appeals next turned to the applicability of the California Reporter's Shield. The California Constitution stated that

... a publisher, editor, reporter, or other person connected with or employed upon a newspaper, magazine, or other periodical publication ... shall not be adjudged in contempt ... for refusing to disclose the source of any information procured while so connected or employed for publication in a newspaper, magazine or other periodical publication.

According to Apple, the petitioners failed to meet the conditions of the shield because they were not engaged in "legitimate journalism or news." Internet Web sites did not fall under the language of "newspaper, magazine, or other periodical" and, even if they did, what O'Grady and the others were doing was not journalism but trade secret and copyright infringement.

Taking a different view of the reporter's shield, the Court of Appeal held that it was impossible for a judicial body to determine what constituted "legitimate" and "illegitimate" journalism without endangering the protections of the First Amendment. Print reporters, for instance, regularly include verbatim documents in their reporting, yet this does not exclude them from legal protection. Following this reasoning, the Court of Appeal held that there is no reasonable distinction between the publication of such a document in a newspaper versus posting it on an Internet Web site. Apple also failed to state any compelling reason why Internet publications should be excluded from the reporter's shield. Many print magazines, in fact, are now offering electronic versions of their publications, yet few would contend that the publication being online invalidates

its journalistic nature. Therefore, the fact that “new media” was not included in the specific language of the shield did not mean that the shield’s intention was not applicable to digital magazines and Internet publications. Since the intention of the shield was to protect reporters in the gathering of information, it made little difference to the Court of Appeal that the mode of publication was not specifically covered in the language of the California Constitution.

Finally, the Court of Appeal addressed the petitioners’ claim that the First Amendment provided broad protection of the identities of confidential sources who divulge information to reporters. Here, the Court of Appeal relied on a balancing test established in *Mitchell v. Superior Court*. *Mitchell* recognized a qualified privilege for reporters, editors, and publishers to withhold the identity of confidential sources, though this privilege had to be weighed against factors such as the nature of the litigation and the exhaustion of alternative remedies. Applying the *Mitchell* criteria, the Court of Appeal ruled that the qualified journalistic privilege was upheld in the case because none of *Mitchell*’s exceptions were deemed applicable. Apple, for instance, had not exhausted all the means at its disposal to compel its own employees to reveal their role in the unauthorized disclosures since it had not forced any of them to testify under oath about the leaks. As such, the potential threat to First Amendment protections of journalistic sources outweighed Apple’s interests in discovering the identities of those sources.

Significance

Apple faced a great deal of criticism over the lawsuit, which perhaps explains why the decision was not appealed further. It should also be noted that the decision by the California Court of Appeal did not apply to courts outside the state of California, though courts in other states could look to the decision for guidance in their own rulings. The case did, however, establish some important precedents in the development of First Amendment law and its applicability to social media. The California Court of Appeals refusal to distinguish between legitimate and illegitimate forms of journalism broadened the legal protections of print journalism to include publishers, editors,

and reporters of Internet media. The decision was also significant in that the Court of Appeal was willing to equate electronic forms of journalism with more traditional forms and held that the First Amendment applied equally to both.

At the same time, the case revealed the difficulties in protecting intellectual property rights in the electronic age and the Court of Appeal’s ruling will make that effort even more challenging. The decision also evaded, rather than resolved, the thorny issue of whether every individual who posts information to a Web site should be considered a “journalist” subject to First Amendment protections or whether lines of distinction need to be drawn to clarify the legal definition of an Internet news publication and a journalist. These and other issues will continue to challenge the legal system and society as social media continues to expand.

Arab Spring

In the uprisings that began in late 2010 in Tunisia and swept across several countries in north Africa and the Middle East, social media played a significant—yet hotly debated—role. Platforms

such as Facebook and Twitter were used early on by activists both to organize demonstrations and to disseminate information outside of their countries' borders. Social media were also utilized in some countries by governments seeking to crack down on online activism.

Blogging and social media were already popular across the Arab region, and in some countries—including Tunisia, Egypt, and Syria—online activism was already a phenomenon going back half a decade or more, with activist networks already in place. In other countries, such as Libya, low Internet penetration rates meant that social media were relatively unused for activism prior to the 2011 uprising.

Tunisia

In the final weeks of 2010, Tunisians took to the streets in protests inspired by the self-immolation of a young fruit vendor named Mohammed Bouazizi. The demonstrations—which started in the town of Sidi Bouzid—went largely unnoticed at first, but photographs of the protests quickly spread on social media, causing the demonstrations to grow, with protesters eventually demanding an end to the government of Zine al-Abidine Ben Ali, who had ruled the country for 23 years.

Official state media did not report on the protests at first, and international media were largely prevented from entering the country, creating a gap in reporting. For the first several weeks of protests, only a select few international media outlets—including France 24 and Al Jazeera—managed to report on the demonstrations, both relying on on-the-ground reports and photographs from bloggers. As early as December 28, 2010, Al Jazeera English had begun to use photographs taken by Tunisian blogger Lina Ben Mhenni, whose blog—“A Tunisian Girl”—quickly became a source for journalists seeking an insider's view of the protests. Another already-popular exile media site, Nawaat.org, reported on the protests around the clock.

The gap in reporting, coupled with an estimated 36 percent Internet penetration rate, led to social media becoming the primary tools for circumventing the official state narrative. Although the Tunisian government had censored the Internet heavily for years, blocking numerous opposition blogs and the majority of video-sharing sites,

Facebook—which sparked street protests during a previous government attempt to block the site—remained accessible. Though the site was already fairly popular in the country, low data packages introduced in 2009 enabled Tunisians to access Facebook from mobile phones at low rates. Facebook therefore quickly became a central platform for sharing photos, videos, and written content.

The Tunisian government had been monitoring online activity using sophisticated methods such as deep packet inspection (DPI) for years but, in the wake of the protests, sought out new techniques for intimidating online activists. In January 2011, the government perpetrated a man-in-the-middle attack by creating a fake Facebook login page and redirecting the site's uniform resource locator (URL) to that page. This resulted in Tunisians attempting to access Facebook accidentally handing their login information, including their passwords, to Tunisian authorities. Victims of these attacks would later log into Facebook and find that their accounts had been hijacked or deleted.

Internet service providers (ISPs) were also reported to have throttled consumer bandwidth, and users throughout the country reported outages of data service in areas where protests occurred, though the outages may have been caused by network overload. As the demonstrations escalated, harassment of bloggers and social media users—a phenomenon that had existed since 2001—was reported. Prominent blogger Slim Amamou was detained at the Ministry of the Interior, which he reported to his online friends and followers using Google Latitudes. Lina Ben Mhenni and another well-known blogger, Sofiane Chourabi, found their e-mail and Facebook accounts hacked.

In response to the government crackdown, sympathetic foreign groups, such as the collective known as Anonymous, targeted attacks at Tunisian government Web sites. Anonymous and other groups also worked to help Tunisian Internet users access online security, circumvention, and anonymity tools.

The government's efforts to intimidate activists proved largely ineffectual, however, and on January 13, 2011, Ben Ali made what would be his final television speech, promising an end to censorship. Within hours of his appearance, most online blockages were lifted, and the next day, Ben Ali and his family fled the country.

Egypt

In Cairo, on the day Ben Ali fled Tunisia, a small group protested in solidarity outside the Tunisian embassy. Shortly thereafter, a Facebook page that had already risen to popularity in the year prior announced Tuesday, January 25, as a national Day of Rage to call for an end to emergency law, an increase in minimum wage, and the dissolution of parliament. The Facebook page on which the Day of Rage was announced was titled “We Are All Khaled Saeed,” so named for a young victim who had died at the hands of police in 2010 in Alexandria. By January 2011, the page had nearly half a million users, due in large part to the fact that images of Saeed’s brutalized body had circulated online, causing outrage and resulting in the prosecution of the responsible officers.

On Twitter, activists selected the hashtag #jan25 in advance of the protests, while on

Facebook, groups shared information on where demonstrations would take place. Google Docs containing information on what to do in the event of tear gas, as well as other key information, were disseminated throughout both public and private online networks.

On January 25, as more than 20,000 Egyptians took to the streets, the government—which was well aware of Egypt’s online activist networks—quickly responded by blocking access to Twitter, live-streaming site Bambuser, and the site of an independent opposition newspaper, *Al-Dostor*. The next day, as protests continued in Cairo’s Tahrir Square, authorities blocked Facebook as well. Members of the We Are All Khaled Saeed group, aware of the possibility of a ban, had already begun collecting members’ e-mail addresses.

Egypt’s Internet penetration at the time of the uprising stood lower than Tunisia’s, at

A protester holds a sign referencing the Facebook and Twitter elements of the Egyptian uprising in 2011. Egyptian activists used Facebook pages to draw the support of nearly half a million followers and gather large demonstrations in Tahrir Square. The protests led to President Hosni Mubarak’s resignation on February 11, 2011, and to the country’s first truly democratic elections in over 7,000 years.

approximately 25 percent, but Egypt's population—nearly eight times that of Tunisia's—meant that more than 20 million Egyptians were Internet users. The government, seeing this as a threat, looked for a solution and, on January 28 at 12:34 a.m., forced Egypt's ISPs to disconnect from the Internet. Only one ISP with 8 percent of the market share, Noor, remained operable. Activists mobilized to set up hubs at homes connected to the ISP, working with a digital hub in Tahrir Square that was amassing photo and video content from protests, utilizing wires spliced from street lights to keep their equipment charged.

As they did with Tunisia, hacktivist collectives such as Anonymous and Telecomix sought to assist Egyptians on the ground, providing land-line numbers for dial-up connections. Meanwhile, although foreign media were allowed into Egypt, many journalists began to rely upon mobile connections to activists on the ground for reports.

Three days later, the one remaining ISP, Noor, was disconnected. Google and Twitter responded by offering a tool called Speak2Tweet, which allowed Egyptians on the ground to call a number using their mobile phones and leave voice messages that would then be tweeted from Speak2Tweet's Twitter account. With many of the voice messages in Arabic, several groups mobilized to form translation teams, transcribing and translating the messages into English for a broader audience; many such messages were then used by journalists in their reporting on the demonstrations. Web sites such as Global Voices Online, which reports on blogs and social media around the world, used personal networks to report messages received from Egypt via telephone.

On February 2, Internet services were resumed. The shutdown, which was said to have cost Egypt \$90 million, actually may have had the opposite effect as intended, many bloggers reported, instead encouraging some to join the protests.

A few days prior, on January 28, friends of Wael Ghonim, an Egyptian Google executive, had begun to report him as missing. On February 7, Ghonim was released and, in a tearful interview, admitted that he was the creator of the We Are All Khaled Saeed Facebook page while calling all Egyptians heroes. Ghonim's appearance may have revitalized the crowds in Tahrir Square, for over the next four days, the crowds grew larger

and more determined. On February 10, it was announced that President Hosni Mubarak was to give a speech. For hours, Egyptians and foreign observers awaited his appearance, speculating on Twitter using the hashtag #ReasonsMubarakIsLate. Following the speech, in which the president made it apparent he would not be stepping down, protesters marched toward the presidential palace and were let past the guards without incident, indicating that Mubarak was not there and the speech had been prerecorded. The next day, it was announced that he had stepped down.

After Mubarak stepped down, Egyptians continued to use social media to organize additional protests as well as to register complaints against the interim government and, later, the government of President Mohammed Morsi. Citizen journalism became increasingly popular; one collective in particular, Mosireen, collected videos, organized screenings, and later used social media successfully in a campaign to raise more than \$40,000 on the fund-raising site IndieGogo. Hashtags such as #egypt, #fuckscf (which refers to Egypt's Supreme Council of Armed Forces), and #tahrir were still being used nearly two years after the initial uprising, and many prominent Egyptian Twitter users continued to comment regularly to media. Additionally, following the election of Mohammed Morsi, his party—the Muslim Brotherhood—increased their use of social media, tweeting from @IkhwanWeb and regularly updating their official Facebook page.

Morocco

Following the success of Egyptian protesters, individuals and groups throughout the Arab region began using social media to call for protests in other countries, including Libya, Bahrain, Syria, Algeria, Morocco, Jordan, Sudan, and Yemen. While protests did occur in each of these countries, the degree to which social media were a contributing factor is debatable. Internet penetration throughout the region ranged wildly. While around 77 percent of Bahrainis were connected to the Internet in February 2011, in the remaining countries, Internet penetration rates ranged from approximately 5 to 50 percent.

Moroccan activists may have had the most success using social media. Using the hashtags #Feb20 and #Fev20 (the French equivalent),

Moroccan activists planned protests for February 20, 2011. Although initial turnout was low, the demonstrations sparked the creation of a popular Web site Mamfakinch (which means *no concessions* in Moroccan dialect), which—using Twitter, Facebook, and other social media—may have played a role in stoking further protests. A campaign on YouTube in which youth explained their reasons for supporting the February 20 movement also went viral.

On March 9, 2011, King Mohammed VI responded to protesters' demands, promising reforms and later pardoning dozens of political prisoners. Protests nonetheless continued, and on June 17, 2011, the king announced a series of constitutional reforms, passed through a national referendum on July 1. While the reforms were supported by much of the population, the February 20 movement rejected the proposals and continued to organize demonstrations into 2012.

Libya

In Libya, where initial protests were ultimately successful due to North Atlantic Treaty Organization (NATO) assistance, social media served as channels for getting information about the demonstrations out of the country. With low Internet penetration in Libya, journalists relied heavily on media hubs that emerged along with the protests. One Web site in particular, *libya feb17.com*, helped to connect Libyans on the ground with journalists, while a popular Twitter account, @Feb17Voices, relayed on-the-ground accounts from around the country. The Libyan diaspora played a clear role in disseminating information from activists on the ground, often using traditional means of contact rather than social media platforms.

Yemen

Estimates of Yemen's Internet penetration in 2011 range from 2 to 15 percent, but the country's extremely young population (according to the Central Intelligence Agency *World Factbook*, 42 percent of the country's population is aged 14 years or younger) reportedly factored into why social media contributed to the protests in that country.

While the bulk of mobilization efforts reportedly occurred through word of mouth, radio, and short messaging service (SMS), Facebook was

utilized to send word of demonstration dates and locations and enabled Yemenis living in disparate parts of the country to connect. Many independent opposition groups are reported to have held meetings in private Facebook and Google groups. In mid-2011, an estimated 30 Yemeni revolutionary Facebook groups existed.

Bahrain

In Bahrain, the government—which had for years controlled online content and conducted online surveillance—was prepared for the protests, which were advertised on Facebook and Twitter to occur on February 14, 2011. On February 11, in an apparent effort to prevent the demonstrations, Bahrain's King Hamad appeared on state media to announce that each family would receive 1,000 Bahraini dinars to celebrate the 10th anniversary of the National Action Charter referendum, also on February 14.

The king's overtures did not stop the protests, however, and despite their small size, the demonstrations were met with force by the government. After security forces killed four protesters and injured more than 300 on February 17, the demonstrations quickly escalated, and within a few days, the opposition demonstrations had garnered more than 150,000 participants, while smaller counterdemonstrations brought together tens of thousands.

Online, a similar battle was waged, with progovernment forces utilizing Twitter to discredit and, in some cases, threaten opposition activists and foreign journalists, including the *New York Times*' Nicholas Kristof. Bahrain's government reportedly spent millions of dollars on public relations during the protest, some of which may have gone toward attempts to hijack the social media narrative. According to numerous reports, the government also utilized a German digital surveillance tool called FinFisher, produced by the Gamma Group, though Gamma officials claim that they did not sell to Bahrain and that the version used was an unofficial copy.

Throughout 2011, Bahraini authorities arrested numerous high-profile bloggers and online activists including Ali Abdulemam—the founder of BahrainOnline.org who was then sentenced in absentia to 15 years in prison—and Nabeel Rajab, the president of the Bahrain Center for Human

Rights. Bloggers and activists continued to report harassment and intimidation by authorities well into 2012.

Syria

In Syria, a small number of activists inspired by Egypt's uprising used social media to call for a Day of Rage on February 5, but only a handful of demonstrators showed up. Three days later, Syrian authorities restored access to Facebook, YouTube, and Blogspot, all of which had been banned since 2007. While some celebrated this development, others cautioned that it would make surveillance by Syrian authorities easier.

On March 7, additional protests and hunger strikes were triggered by the arrest, the day prior, of several young boys in the city of Daraa for writing antiregime slogans on walls in the city. A second Day of Rage was announced for March 15, and simultaneous demonstrations took place across several cities in Syria, with protesters demanding an end to Syria's emergency law, an end to government corruption, and more freedom in general. The next day, protests continued in front of the Interior Ministry, with an estimated 200 people calling for the release of political prisoners. Several human rights activists were arrested, prompting calls on Twitter for their release. These events led to the announcement of a Day of Dignity on Friday, March 18, a phenomenon that would lead to Friday as a weekly day of protest for the first several months of the uprising.

By late March, accounts of government interference with social media began to emerge. One prominent activist, Khaled Elekhetyar, briefly went missing and returned to find government supporters had hijacked his accounts. As reports of mass killings in Daraa emerged on Twitter, foreign media began to rely on social media for their reporting; in particular, graphic videos from Daraa showing extreme violence helped draw global attention to the unfolding crisis.

As in Bahrain, an online battle also began to unfold, with a network dubbing itself the Syrian Electronic Army (SEA) perpetrating attacks on the Web sites and Facebook pages of those it deemed to be supportive of the Syrian opposition, including Oprah Winfrey. In June 2011, Syrian President Bashar al-Assad recognized the SEA as

a "real army in virtual reality." Meanwhile, on Twitter, seemingly independent actors attempted to distract from opposition reports by flooding the hashtag #Syria with dozens of tweets per minute, typically linking to photos of the country and other content unrelated to the uprising.

As the conflict continued well into 2012 and the death toll rose above 15,000, foreign media—mostly barred from the country—continued to rely upon citizen media reports but, following several high-profile mistakes, frequently offered caveats when information was unverified.

The Role of WikiLeaks

While numerous reports—as well as WikiLeaks founder Julian Assange himself—credited WikiLeaks's late 2010 release of U.S. diplomatic cables with prompting the uprisings in Tunisia and Egypt, others viewed the whistle-blowing site as having a limited role.

Sami Ben Gharbia, one of the cofounders of the Tunisian citizen journalism site Nawaat.org, worked to coordinate translations of the cables related to Tunisia, posting them on a site he founded called TuniLeaks. Gharbia argued that, because the cables were then available for Tunisians to read, they helped tip the balance by confirming what many citizens already knew. Prominent, award-winning Egyptian blogger Wael Abbas shared Gharbia's sentiment, according to Yasmine Ryan, comparing the role of WikiLeaks to the many videos he had posted of Egyptian police brutality.

Twitter Revolution?

Prominent writer Malcolm Gladwell, in an October 2010 essay subtitled "Why the Revolution Will Not Be Tweeted," argued that online activism cannot create the type of "strong ties" needed for real change. Citing the work of Evgeny Morozov, Gladwell also argued that governments would always have the upper hand online.

Early on, journalists revived the term Twitter Revolution, first used in Moldova and then Iran in 2009, to describe what was happening in Tunisia and Facebook Revolution to describe the events in Egypt. The successes in the two countries prompted a slew of responses to Gladwell's original piece as well as numerous academic articles debating the veracity of such claims.

While there is no consensus as to whether the various uprisings would have happened without social media, scholars have pointed to several factors to determine the utility of social media in a given country, including the degree of Internet access, the prior existence of strong online and offline networks, and the technical savvy of a given government in conducting censorship and surveillance.

Artists and Social Media in Politics

The use of social media in art grew out of a movement in the 1990s called "Net Art," which attempted to harness the newly developed World Wide Web for artistic pursuits. Where Net Art focused on investigating the effects and limitations of the new technology, social media art utilized services such as Myspace, Facebook, Twitter, and Tumblr to create artworks that also tapped into the social possibilities of the World Wide Web. Leila Nadir and Carry Peppermint have described social media art as "environmental art" that takes place within a new media environment, extending principles of installation sculpture, performance art, and public art to the online sphere.

Social media art is typically identified as starting around 2007, with Facebook's lifting of membership restrictions requiring users to be part of universities. Facebook's more mature user base gave the Web site more legitimacy in the eyes of new registrants, which in turn propelled social

media to mainstream acceptance not afforded by the early sites such as Myspace, Friendster, and LiveJournal that catered toward younger audiences and had a much less clean and organized aesthetic. This new focus on social media as a culturally accepted way to interact with others combined with Web 2.0 principles of open information and collaboration to create blogs, wikis, and other content creation and sharing sites that opened up new possibilities for artists. Many of these technologies were also adapted to be easy to install, which in turn allowed nonprogrammers to set up and manage complex sites and databases. The rise of Application Programming Interfaces (APIs) gave access to large data sets and features in social media sites that could be used for art pieces as well.

Initially, art's engagement with social media was primarily marketing-driven and used for self-promotion. Artists, galleries, and museums attempted to find new ways to share pre-made artworks and create online brands and identities. Within a few years, however, the exploratory tendencies of Net Art had taken hold and the social media sites and principles were used as a medium in their own right to stage performances and create crowdsourced works. These artworks also began to take on a political tone, some dealing with the larger implications of technologies that allowed varying degrees of freedom and control and others drawing attention to more specific political movements and actions.

Forms

Political remix videos (PRVs) are one instance of how artists began to use access to digital technology and social media for political purposes beyond simply advertising offline art. Claiming a heritage that extended through Situationist and other types of cinematic reframing, PRVs reorganized and reframed mass media video clips as political commentary, seeking to provide a critical view of the mass media's presentation of political events and characters, as well as social issues such as class, gender, and race. The ability to host these videos on YouTube, as well as the ease of sharing through social media networks such as Twitter and Facebook, allowed for mass dissemination. However, these videos often met with copyright issues stemming from their use

of protected material. In turn, this caused many videos to be taken down and subsequently re-uploaded, as well as directing PRVs to focus on copyright issues in the digital age.

Social media art also extends beyond the sharing of artworks through social media networks. It often takes the form of performance, with the artist creating an artwork that unfolds over the social network through the actions of participants. Though the artist is the primary creator of the work, it often takes on a life of its own as it is modified and directed by participants. A large part of social media artworks involved the artist initializing the work, but then allowing it to develop in unintended ways according to responses from viewers or co-collaborators, many of whom were personally unknown to the artist. These artworks use pre-existing platforms such as Facebook, Second Life, Twitter, or chat rooms to deliver and create content or to organize large-scale performances that took place on the social media networks themselves. These works attempt to bring in other users of the social networks in order to involve them in the art-making process while also drawing attention to the power of crowdsourcing.

Major artists in social media art include Ai Weiwei, An Xiao, Nic Rad, Man Bartlett, Lauren McCarthy, William Powhite, Jennifer Dalton, and the "global online art collective" @Platea.

The art itself is usually composed of a process of selection, bringing in pre-made elements from digital sources. Photos, Rich Site Summary (RSS) feed entries, tweets, and data from a wide variety of pre-existing Web sites accessible through open APIs allow artists to access and manipulate data. Users can add their own data to many projects as well. Though these channels provide a great degree of access, much of it is also closed off from use by anyone other than the programmers of the specific platform. Even in the face of some restricted information, social media art has developed primarily as a medium that champions the open access of the World Wide Web and the ability to take previously unavailable data and use it in new contexts.

Themes

Claire Bishop has drawn the connection between the process of reusing pre-existing data in social media art and the appropriation art of the 1980s,

in which artists would reshow premade artworks within a new setting. According to Bishop, the difference between the two lies in the differing ways they operated. Appropriation art relies on a principle of repurposing while social media art uses selection as a major component. Instead of revisiting appropriation art's questioning of issues of authorship and originality as they exist in the age of mechanical and digital reproduction, social media art looks to provide meaningful recontextualization of existing artifacts. It focuses on the way that technology operates through assembling already existing data rather than creating it from the ground up. Such a focus on repurposing has also opened up themes initially brought up by Net Art, such as the "archival impulse" pointed out by Hal Foster.

Social media art, like Net Art, works by probing into pre-existing databases of images, information, and objects but reconstructing them into new, subjective archives. In turn, this serves to subvert entrenched systems and hierarchies by creating new arrangements and privileging individual interpretations over objective or systematic ones. Additionally, selecting archival materials serves to break apart origin myths of current power structures, removing some of their justification. By reconstructing histories within new contexts and with new subjective interpretations, legitimacies of the hegemonic power structures created by those histories are also called into question.

Many artworks take on the growing issue of the dissolution between public space and private space. They address the growing issue of sharing too much information online, causing people's lives to become lived out in the open. More prevalent in early social media artworks, these works anticipated the need for self-censorship and default privacy controls within networks, as well as discussions about how private information posted online should be used in offline and professional settings. Some works, such as Cary Peppermint and Leila Nadir's "Overexposed Dancing," look at how the new technology led to people sharing intimate moments of their lives with both friends and strangers, sometimes inadvertently, sometimes with full knowledge of an opening up of the private sphere. Others, such as Nic Rad's "PeopleMatter" series, explored how public online faces and representations become

a stand-in for the private selves. Peppermint and Nadir have also asked whether the amount of shared private information will become so large that the individual and the artists themselves will disappear as a result of too much information to process, heralding a new type of anonymity.

With a focus on the redefinition of public space, social media art also seeks to make an intervention in the use of that space. Groups such as @Platea attempt to re-envision social media as a "digital megacity" and social media art as work that takes place within this city, continuing principles laid down within "offline" public art. They advocate creating artworks that exist within a public online space both as monumental works that are extremely visible and as hidden works that users can stumble upon as they move through online space. Works such as "The Dive" encourage participants to engage in a collective performance, updating social media profiles with textual or pictorial content that contain representations of "diving" throughout the day.

The purpose of these performances is to repurpose these sites and the new technological features to turn them into artistic works that cause other users not involved with the creation of the piece to question the environment they are interacting in. Occasionally, works also become social media "covers" of previous works. "Following Piece 2.0" is one such example, a reperformance of Vito Acconci's 1969 work "Following Piece" that took place as multiple artists followed people in public spaces and reported details through the #fp20 hashtag on Twitter. This work attempted to call into question what happens when people "follow" someone on Twitter and bring attention to the voyeuristic nature of many social media sites where private users can watch public and private actions of other users without a reciprocal gaze.

Social Issues

Where @Platea brings up issues of public and private space within a discourse of the World Wide Web as a city, other social media art projects examine social media's potential to create a global, public forum for discussion about political issues. #Class was a one-month project organized by William Powhite and Jennifer Dalton that sought to examine the ability to incorporate social media into a public dialogue about "the gallery model,

the commodification of art, and all the unquantifiable, intangible, unpaid aspects of participating in the art world.” It broadened the notion of an online public space to include a physical gallery space that was supplemented by social media technologies, allowing participants throughout the world to become involved without having to be present physically at the time the performance was happening. The project addressed issues of access, attempting to bring art to individuals who did not live in major metropolitan art centers. Many of the panels and artworks within the project were also aimed at drawing attention to the growing class issues in the art world, as well as within the larger economic system in the United States.

Social media art has been cast as a potential venue not just for access to dominant art paradigms by artists in marginalized areas, but also to give global exposure to emerging artists. Through increased communication and the ability to share information across large distances, artists can create art worlds that do not have a physical presence in cities such as New York or London and can promote works by artists not physically present. The low cost of using a pre-existing social media platform or setting up an entirely new site allows artists who would traditionally lack access to art materials or artist groups to create and share works. As artists can communicate with less reliance on galleries and showing work in a single physical location, it is possible for artists and groups of artists to create alternative art worlds outside of the current institutional structure.

These projects, and other social media art projects, attempt to bring production back into the hands of the masses. They question the legitimacy of a single author and advocate for crowdsourced creation of art and knowledge. By bringing in multiple participants with varying degrees of input over the artwork, social media art attempts to resist hegemonic structures of power. Multiple, subjective experiences are privileged, as are fragmentation and constant evolution of the work. Many pieces, especially those by groups such as @Platea, also seek to include a global perspective by bringing in contributors from around the world.

Artists who are brought into these works are often not traditionally trained and do not need to be professional artists. The widespread and

colloquial use of social media platforms allows individuals who do not have an academic understanding of art history, art theory, or even basic art techniques to work on pieces. Additionally, the ability to crowdsource pieces lets anyone with access to a computer and the appropriate Web sites give input into the project or steer it in a particular direction. Many of these artists can be temporary artists, only working on one or a few social media pieces before returning to another occupation.

The accessible nature of social media art, combined with the use of repurposed data and pre-existing elements, brings up issues related to high-brow and low-brow art. With many untrained artists creating works outside of traditional mediums, the work’s adherence to formal high-brow structure and execution is put aside, replaced by a focus on innovation and collage-like reconstruction of data. Often, these works are critiqued as having a derivative style that reflects the use of the technological medium in mass culture and society. These works also tap into uses and expressions of technology as found in advertising, education, science, and everyday use. In turn, these more everyday influences bring social media art away from the realm of the high brow and into what could be identified as the domain of low-brow art. For social media art, this movement is seen as beneficial, even though it calls into question its status as “art.” By tapping into low-brow art methods and sentiments, social media art can further its goal of breaking down hierarchies and promoting mass participation in the art-creating process. It also encourages participants and viewers to look at the technological media they use every day in an artistic, creative, and politically active context.

Political Critiques

Social media art also calls into question the division between online and offline worlds by seeking to make real world change. It responds to a critique of technology as a disembodied force that creates a separate, virtual environment that stands in opposition to a “real” or physical world. It seeks to explore online art as an extension of offline life, as well as the ability of online organization and sharing to effect change offline. Additionally, it seeks to use social media as art, but in ways that align with the typical use of social

media by the mainstream public. Social media art repurposes social media and accentuates its potentially creative aspects, but it seldom engages in hacking the sites or using the media in ways drastically beyond the popular use. Such tactics appear to fall short of a full exploration of the potential of new technologies, but they allow a broader population to view and add to the work. By bringing together global artists and advocating the creation of multiple, subjective narratives, social media art creates oppositional structures to offline institutions. The art world is commonly a target of these works that seek real-world change (as with #Class), but governmental structures are also often critiqued.

Ai Weiwei

Once such instance of a specific, local critique of a political institution is the work of Ai Weiwei. Working in China, Ai's work seeks to bring attention to what he feels are unjust practices of the Chinese government. Twitter is one of his major outlets, though the service is banned in China. His account has upwards of 200,000 followers and is used to share his work as well as organize gatherings while also presenting a real-time record of his art activism. His tweets often criticize the government, providing a public expression of dissent to both national and global audiences. These tweets have included hospital pictures following an assault by police in Chengdu, a list of the students who died in the Sichuan earthquake, and the organization of Say Out Your Name Activity, where Chinese nationals tweeted out their real names and locations.

The anti-authoritarian stance and alternative space of dissent that Ai has created has also resulted in a forceful response from the Chinese government. Through his highly visible and globally-followed social media accounts, Ai has gained a considerable amount of immunity from action on the part of the Chinese government. He has been able to openly criticize the procedures of the government, along with its positions on human rights and democracy. However, he has not been completely without scrutiny or without attempts at censorship. He has been beaten, placed under house arrest, and held secretly under questionable charges. Because of his stature gained through his social media artworks,

A surveillance camera sculpted out of marble was one of a group of works by Ai Weiwei shown at the Smithsonian's Hirshhorn Museum and Sculpture Garden in Washington, D.C., in 2012.

Ai's imprisonment and beatings have garnered the attention of the international community, resulting in petitions and criticism from media outlets and activists in a number of different countries, primarily in the West.

Global art groups paid particular attention to his extended imprisonment in 2011. New York's Creative Time, along with the Guggenheim Museum, the Tate Modern, the United States, the European Union, and other institutions all put out public calls for Ai's release. Many of these took the form of performances that repurposed motifs from Ai's work.

Ai's work taps into many of the themes and issues that social media art in general deals with. His tweets work from behind the "Great Firewall" to make public the private actions of an authoritarian government. Bringing attention to these actions allows him to create an alternative narrative to the official, government-sanctioned one. By creating a public voice, he has

also become the centerpiece for other activists to rally around, inspiring them to form their own critiques, or to pass on his criticism and artwork to others. Through this increased visibility online, he hopes to bring about institutional change in China and increased global scrutiny into governmental practices.

Asia

In some ways, social media can be said to have been invented in Asia, in the sense that the continent itself can be classified as an "early adopter." It is not surprising, given the variety of cultures and politics in Asia, that the use of social media in the region is varied. Some Asian countries boast the highest rates of Internet connectivity in the world (Japan, Singapore, South Korea, and Taiwan) as well as some of the lowest (Cambodia, Myanmar, and North Korea).

Asia, according to an analysis of Internet world statistics, boasts 1 billion Internet users out of an estimated 1.3 billion users worldwide. Because only about 28 percent of Asia's population is online, compared to 43 percent worldwide and 78 percent in the United States, its recent growth in online population means that the total Internet

users in Asia may soon surpass the total number of users in the world. China, with 538 million users, already has the greatest number of Internet users of any country in the world despite its relatively low penetration rate. In addition, its policy of filtering and its restrictions on outside media have resulted in a robust local social media sphere that is much more familiar to its citizens than Facebook or Twitter.

Scope of Social Media in Asia

In 1999, well before Friendster was established and before the dot-com crash, South Korea had its own popular social media site, CyWorld. Users were given a home page and the capability to link to friends, write diaries, and share photos. They could also explore a virtual world with an avatar, as would become popular with Second Life. By 2007, the number of registered users was more than one-third of the country's population. In addition, the citizen journalism site OhmyNews was launched in 2000 by Oh Yeon Ho with the motto "Every Citizen Can Be a Reporter." Although the service soon hired a paid staff, the majority of its stories were written by thousands of registered users who are paid the equivalent of a few dollars for each story accepted by the site's editors. The site was credited with helping to elect a progressive president, Roh Moo-hyun, in 2002.

In June 2005, a photograph of a woman who came to be known as Dog Poo Girl brought to light the possibility of Internet vigilantism. After her dog defecated on the floor of a subway in Seoul, South Korea, a photograph of her and the offending mess was posted to a blog. She was identified within hours based on her bag, her watch, and her dog. Information about her, her family, and her university was used to place harassing phone calls.

In China, this sort of activity has been called *renrou sousuo* (RRSS), which translates as "human flesh search engines." In 2006, a World of Warcraft player posted to a bulletin board system (BBS) accusing his wife of adultery with "Bronze Mustache," the nickname of a student she met while playing the game online. In a short time, the identity of the student, along with his contact information, became publicly available, and enraged citizens began to pester him and his family, as well as their employers and the student's university.

Not all instances of RRSS involve public humiliation, however. In 2009, Deng Yujiao allegedly stabbed a man who sexually assaulted her. She also stabbed his companion. The two turned out to be government officials, and because Deng's assailant died, she was charged with murder even though she had acted in self-defense. Bloggers took up her cause, and the *New York Times* reported that more than 4 million posts were written in her defense. As a result of worldwide attention garnered by this online resistance, the police agreed to investigate Deng's claim and released her on bail. She was eventually convicted of a lesser crime and the government officials were censured.

A 2012 survey by the Pew Charitable Trusts of 21 countries included China, Japan, and India. The highest penetration of social media was seen in British, American, Russian, and Czech respondents, where about 50 percent reported that they used social media sites. In China and Japan, the penetration was closer to 30 percent, while India reported only 3 percent. Among younger users, however, the gap was lower. In the United States, 80 percent of respondents aged 18 to 29 reported using social media, compared to 71 percent in Japan and 61 percent in China.

The Pew survey also asked users of social media whether they used sites to share their views about music and movies, community issues, and politics, among other subjects. U.S. respondents were more likely to talk about music and movies (63 percent) and least likely to talk about politics (27 percent). The Asian countries in the study seemed to be much more interested in expressing opinions about culture; in China and India, about 85 percent of users expressed opinions about music and movies, well above the U.S. average. In terms of politics, opinions about politics were also more likely in China (35 percent) and India (45 percent), even though the rate was lower in Japan (22 percent).

Other studies confirm the popularity of social media while exploring differences in Asian users. A study of LinkedIn's 120 million users also found a robust community of Asian social networkers. Unlike Europe and North America, where a user's network would typically span about 500 miles, users in Asia tended to have much more dispersed networks of up to 1,000 miles, second only to Africa's 1,500 miles. Users in Asia and the Middle

East also tended to spend more time on the site than their counterparts in other regions of the world. The public relations firm Ogilvy ranked six Asian countries (India, Indonesia, the Philippines, Thailand, Malaysia, and Taiwan) and Australia in the top 20 of Facebook countries, ranked by number of users. Ogilvy reported that more than one in four Facebook users (27 percent) in 2012 were from Asian countries.

In 2011, the public relations firm Burson-Marsteller surveyed social media and found that Facebook was the most preferred social media site in Australia and seven Asian countries and cities (Hong Kong, India, Indonesia, Malaysia, the Philippines, Singapore, and Thailand). Other countries had other top sites. In China, for instance, the preferred social media site is Qzone, with 531 million active users and 8.6 billion page views; Western sites like Facebook, YouTube, and Twitter do not make it into the top five Web destinations of China overall, nor even the top five social media sites. Smaller sites are the most popular in other countries, such as South Korea's CyWorld (18 million active users, with 1.6 billion page views), Vietnam's Zing (15 million users, 1.7 billion views), Japan's FC2 (14.5 million users, 3.3 billion views), and Taiwan's Wretch (9 million users, 14 billion views).

Filtering and Other Controls

Web filtering began in Asia soon after the first connections were made. In 1994, China was connected directly to the international Internet and, with the help of Qian Tianbai and the University of Karlsruhe, the Computer Network Information Center under the Chinese Academy of Sciences completed the installation of a domain name server for China's .cn domain on May 21, which ended the history of top-level domain (TLD) name servers being kept abroad. The Chinese government's first Web site, Window on China, went online that same year. In January 1996, the Chinese Public Security Bureau began to take steps to solve the problems related to free international links to the Internet by restricting international access to four portals managed by the Ministry of Posts and Telecommunications, the Ministry of Electronic Industry, the Education Commission, and the China Academy of Science, a chokehold that remains to the present day. At the same time,

the Public Security Bureau demanded that all Internet users be registered with the post office, signing a statement of responsibility and doing nothing to harm the state before they are allowed to use the Internet.

Also in 1996, China famously took steps to limit the information that is available to Chinese users of the Internet, marking a new direction in information policy. The Associated Press reported “China tightens control of Internet, blocks 100 Web sites” on September 9, 1996, when China used its bottleneck of four access points to the outside world to prohibit Internet users from seeing the Web sites of U.S. news media, Taiwan’s government, dissidents, and other politically sensitive groups. According to the Associated Press, the blocking became known when the U.S. embassy received calls from Americans who found they could no longer read U.S. newspapers. Sites that were blocked included the news sites of the *Los Angeles Times*, the *Wall Street Journal*, the *Washington Post*, the Voice of America, and CNN; the dissident sites from the Taiwan Government Information Office, the Tibet Information Network, and Amnesty International; and the sexually oriented site for *Playboy*.

Similarly, in 1996 Singapore announced that its major ISPs would block pornographic Web sites in order to preserve its values, as reported in the *New York Times* on October 14. Singapore, which already had banned *Playboy* and *Penthouse* magazines, extended its effort to exclude content that might undermine moral values. At first, the government allowed Internet users only to access Web pages through a proxy server that did not contain prohibited material. Recently, however, this blocking has become mostly perfunctory; in 2007, the government announced that it blocks only 100 pornographic sites as a “ceremonial” gesture.

Starting in 2000, China began to ask service providers to comply with a “self-discipline” pact and prevent the dissemination of information that harms national security and social stability—meaning that they must regularly patrol discussion boards and delete information that might be offensive to the government. This was tested by Reporters Without Borders in 2003, which found that a combination of filtering that prohibits certain words from being posted on discussion

Spectators following events by laptop in China while waiting outdoors during celebrations of the 60th anniversary of the founding of the People's Republic of China on October 1, 2009.

boards as well as human censors that find information that the filters missed results in the post being deleted and the user account being suspended. This, coupled with the famous capitulation of Google to prevent users inside China from seeing search results that the government finds offensive, seems to indicate that the power of the Internet to set information free has been defeated.

In 2007, the military government of Myanmar (Burma) shut down the country’s Internet access for two weeks in order to stop the circulation of images of its crackdown on protests by monks and civilians in what came to be known as the Saffron Revolution. In August, the leaders of a student movement organized a rally to protest the rise in fuel prices. The movement was taken over by Buddhist monks, and by September the protest grew to 150,000. Protesters logged attacks on them by uploading video and firsthand accounts

to media outside the country. When the government shut down the Internet on September 29, the flow of images out of the country was slowed, but was still possible through trusted networks and satellite. When it is not in crisis mode, the government also restricts upload speeds for customers, which is thought to be an attempt to restrict Internet usage.

YouTube was banned in Bangladesh in 2009, when only 1 percent of its citizens were online, because it carried an audio recording of a meeting between the Bangladeshi prime minister and army officials after a deadly mutiny of border guards. In 2012, YouTube was banned again because it refused to filter a trailer to a film that portrayed the Prophet Muhammad unfavorably.

The Open Net Initiative's (ONI's) studies show a variety of approaches to filtering schemes that shape what information their citizens access in the region. China, Myanmar, and Vietnam used extensive filtering to block Web sites with politically sensitive content, human rights issues, independent media, and reform platforms, a practice that was keenly felt when it came to sites that used local languages. Thailand and Pakistan take a moderate approach to filtering, blocking only what they consider to be sensitive or illegal. Other countries use filtering, such as South Korea (which filters sites that promote reunification with North Korea) and Singapore (which strictly filters pornography).

The ONI points out that filtering in Asia often exhibits a "lack of transparency," in that citizens do not necessarily know that their content is filtered. In this way, when users cannot reach content they are looking for, it seems as if there is a technical, not political or social, block. Only users in Thailand and South Korea were presented with a block page that informed the user that the content he or she was looking for was banned. Furthermore, governments are not always clear from whence their authority to filter derives. In 2007, Thailand became one of the few countries that requires a court order before Internet content can be filtered.

Afghanistan, Malaysia, and Nepal, however, do not appear to use filtering at all. Although Malaysia has the legal mechanism to force content providers to stop communication of indecent or offensive material, the government has

declined to directly censor online activities in the belief that it is essential to encourage the use of the Internet and new media. The Internet was banned outright by the Taliban in Afghanistan in 2001, but after the fall of the Taliban the country was given the authority to control the .af domain. The ONI reports no evidence of filtering. In a country where only 1 percent of the population has Internet access, Mahabir Pun began the Nepal Wireless Networking Project in 2003 with the aim of bringing service to remote mountain regions.

Association of Internet Researchers

The Association of Internet Researchers (AoIR) is an academic society, founded in 1999, that examines the emerging, and interdisciplinary, field of Internet studies. As it came into being shortly after the Internet became popular with the general population, the AoIR has helped shape how academia conducts research related to the World Wide Web, applications, social media, and how individuals engage with these. Each year the

AoIR holds a scholarly conference where papers exploring members' work are presented. The organization also promotes online and other collaboration and cooperation among its members, and maintains AoIR-L, a listserv that serves over 2,000 subscribers.

The international system of interconnected computer networks that is known as the Internet originated during the 1960s as the U.S. government sought to build fault-tolerant, robust computer networks that would permit communication between distant sites. While the U.S. military originally was highly involved in the development of the Internet, this work built upon work done earlier in the United Kingdom.

The Advanced Research Projects Agency Network (ARPANET) first connected laboratories and scholarly centers at universities and various research facilities, allowing connectivity between scientists in different cities and nations to become a reality. As groups such as the National Science Foundation (NSF) increased funding to computer network connectivity projects, the ARPANET expanded during the 1980s and then evolved to provide researchers access to university-based supercomputers.

By the mid-1980s the NSF network (NSFNET) succeeded the ARPANET, and by the end of that decade private Internet service providers began to emerge. After the NSFNET was decommissioned in 1995, the commercial uses of the Internet blossomed, as the last remaining restrictions on the use of the Internet were removed. As a result, growth of the Internet by commercial organizations and individuals boomed.

As early as the 1970s computer scientists began studying the effects of computer networking systems. While researchers in the fields of business and library science also began studying how computers were changing the ways in which individuals and groups interacted, such interest was generally not shared by scholars in other fields. By the mid-1990s, however, scholars interested in a variety of disciplines began taking increasing notice of the growth of the Internet.

In 1996, Georgetown University began offering an M.A. degree in Internet studies and the University of Maryland formed the Resource Center for Cyberculture Studies. Around the same time, the National Science Foundation, carrying

out a mandate from the Clinton White House, convened a special panel of 33 Internet scholars, practitioners, critics, and visionaries to develop an anthropological research agenda for studying the Internet and society in the 21st century. In 1998 Drake University hosted a conference known as "The World Wide Web and Contemporary Cultural Theory: Metaphor, Magic & Power." At this symposium, discussions began regarding the need for a learned society that concentrated upon advancing the field of Internet studies. Consequently, the following year over 60 Internet researchers and scholars convened to form the AoIR. The organization soon took a leading role in shaping how research related to the Internet is conceived, conceptualized, and conducted.

Objectives and Services

Internet studies, as an emerging and innovative field, examines technology and individuals' and groups' response to this from a variety of disciplinary perspectives. These disciplinary perspectives include artistic, cultural, economic, pedagogical, political, psychological, social, technical, and other outlooks. Certainly studies of the Internet and its effects may be conducted by members of traditional academic departments, such as anthropology, communications, psychology, sociology, or other fields of study. Internet studies, however, has become a recognized field of study at a variety of institutions, although sometimes known as "convergent media," "digital culture," or "new media." A variety of colleges and universities have created separate departments of Internet studies, including Appalachia State University, Brandeis University, Curtin University of Technology, Endicott College, Hebrew University of Jerusalem, Oxford University, and the University of Minnesota. The creation of the AoIR helped to build communication and interaction between members of these institutions and to encourage collaboration and the sharing of resources.

The AoIR believes that valuable and authentic research related to the Internet is predicated upon the fundamental principles of academic freedom, equality of opportunity, and respect for human dignity. To that end, the AoIR has established policies that its members and officers do not discriminate against individuals because of age, ancestry, color, disability, marital status,

national origin, race, religion, sex, or sexual orientation. Operation of the AoIR is administered by an executive committee, which is culled from its board of trustees. The AoIR works to foster interdisciplinary and interprofessional interaction between scholars that promotes critical research into the Internet's aesthetic, cultural, economic, political, and social characteristics. Seeking to differentiate itself from the monolithic and tradition-bound practices of many other learned societies, the AoIR has eschewed many common structures in order to encourage a more organic, natural community of scholars. A key part of building this community has been the annual meeting of the AoIR, its listserv, and its publications.

A variety of scholars played lead roles in forming the AoIR. Steve Jones, professor of communications at the University of Illinois at Chicago (UIC) served as the organization's first president and helped create the infrastructure by which the AoIR is run. Nancy Baym, a professor of communications at the University of Kansas, succeeded Jones as the AoIR president in 2003. Baym also organized the learned society's first conference in Lawrence, Kansas, that took place in 2000. Program chair for the first five AoIR conferences was Jerry Hunsiger, then at Virginia Polytechnic Institute and State University, who also greatly helped to build the organization's technical infrastructure. The annual AoIR conference has grown to include hundreds of scholars, students, and others interested in the interdisciplinary approach to Internet research of the learned society. Because it embraces research using a variety of methodologies, the AoIR welcomes scholars from a variety of perspectives and provides a forum that is friendly and supportive of participants. Held in a new location each year, the AoIR annual meeting has taken place in Minneapolis, Maastricht, Toronto, Brighton, Chicago, Brisbane, Vancouver, Copenhagen, Milwaukee, Gothenburg, Seattle, and Salford. Each conference is organized around its own theme, and those covered to date have included performance and participation; sustainability, participation, and action; interconnections; the Internet; and bandwidth. Through 2006, selected papers presented at the conference were compiled in an *Internet Research Annual*, of which four editions were published in conjunction with Peter Lang Publishing.

AoIR-L, the listserv of the association, has over 2,000 members and has played a tremendous role in allowing discussion of methodologies, ethics, research questions, and other areas of concern to those who conduct Internet research. Various working groups have undertaken projects on behalf of the AoIR membership, resulting in leading-edge documents regarding ethics, politics, and interaction with the communities in which researchers live and work. As concerns about and interest in the nexus of social media and politics continue, the AoIR will undoubtedly continue to play a lead role in defining how research in this area is conducted.

Astroturfing

"Astroturfing" is a political, public relations, or advertising campaign that deceptively and artificially creates an impression of widespread grassroots support for a product, policy, or concept, when in actuality limited support exists. Typically, a corporation or political group employs

astroturfing to promote corporate concerns while claiming to represent the public interest and community concerns. The term is a derivation of AstroTurf, a brand of artificial carpet designed to simulate natural grass.

Astroturfers mimic and reproduce the forms and messages of traditional grassroots social movements and use software to mask their identities. Dummy interest and pressure groups (called front groups) are often used to create the perception of public backing of the client's agenda and to hide the identity of the organization or corporation funding the astroturfing effort. The names of corporate front groups are strategically selected to disguise the actual funders of the group. For instance, during the debate over the 2009 American health care law, the drug lobby PhRMA and the Service Employees International Union ran television ads under the group called Americans for Stable Quality Care. Another common technique is the mobilization of thousands of supporters or the creation of numerous online personas to post reviews and comments, call into talk radio shows, and ballot stuff online surveys. The Public Relations Society of America has decried the practice as unethical and considers assisting front groups as malpractice under the organization's code of ethics.

The term dates back to 1985, when U.S. Senator Lloyd Bentsen responded to the large number of postcards arriving in his office by saying, "a fellow from Texas can tell the difference between grassroots and astroturf. . . . This is generated mail." Such techniques, however, have a long history. In *Julius Caesar*, William Shakespeare describes Cassius writing letters "in several hands . . . as if they came from several citizens" to urge Brutus to join the conspiracy against Caesar. Astroturfing techniques flourished in the United States and are an accepted, if often hidden, aspect of public relations campaigns. Today, astroturf efforts are especially common in political consulting and digital communications firms and are usually called issue campaigns or grassroots advocacy.

Modern astroturfing campaigns are incredibly sophisticated. Many public relations firms maintain databases of citizens willing to mobilize for various companies and causes. If a voter database does not exist, consumer lifestyle databases are consulted to locate sympathetic voters located

in a targeted politician's district. Public opinion polling and focus groups help refine the messages most likely to resonate with the targeted groups. Talking points and scripts are provided to the supporters, and the supporters are encouraged (and frequently paid) to make phone calls and send e-mails to their elected officials, to write letters to the newspaper, and post comments on their social networking profiles. Supporters are also encouraged and paid to fill rooms at town hall meetings. An astroturf campaign will also usually include several media events and press conferences, full-page advertisements in insider media outlets such as *Politico* and *Roll Call*, and paid research studies supporting the effort.

A spin-off technique, known as grass tops, uses influential community leaders such as mayors, religious leaders, and business executives to lobby members of Congress and regulators. Instead of blanketing Capitol Hill with thousands of identical postcards, grass tops advocacy mobilizes a handful of local and regional public opinion leaders in key states to make the case to lawmakers.

Social Media

Technological advances, including e-mail, voter databases, automated phone services, telephone banks, and social networking, decreased the cost of astroturfing and fostered its popularity. For example, persona management software can generate thousands of fictitious identities and add a degree of realness by creating a name, e-mail account, and social media profile for each virtual account, randomizing the operator's Internet protocol (IP) address or establishing IP addresses in specific geographic locations to trick geolocation services and linking dummy accounts to the profiles of other fake accounts to add legitimacy. These fake accounts are referred to as sockpuppets, and the practice of using misleading online identities is known as sockpuppeting.

Astroturfing campaigns are frequently used on the Internet to generate buzz and word of mouth via blogs, Twitter, and social networking sites. In 2006, for instance, a travel blog called Wal-Marting Across America, which appeared to chronicle a couple's cross-country trip in an RV while staying in Wal-Mart parking lots, was revealed to be funded by a front group named Working Families for Wal-Mart and written by employees of the

public relations firm Edelman, who represented Wal-Mart. On Web sites like Yelp and Amazon, astroturfers write glowing reviews. In 2010, a government investigation found that iPhone game developers were paying the public relations agency Reverb Communications to post positive reviews of games in Apple's App Store, which gave the impression that the reviews were authored by disinterested consumers. Governments have also used the technique. The Chinese government reportedly trains and funds thousands of commentators to permeate Internet forums and message boards with progovernment comments in an attempt to shape public opinion.

In the United States, the Federal Trade Commission's Guides Concerning the Use of Endorsements and Testimonials in Advertising require product reviewers, endorsers, and others providing testimonials to disclose material connections such as payments or free products. So by law in the United States, Twitter and Facebook users, bloggers, and individuals writing product reviews on e-commerce sites must disclose connections they share with the seller of the product or service. This includes celebrities, who often endorse products in traditional advertisements and on Web sites and social networking sites.

Attention Crash

Nowadays, individuals live in a world governed by modern technologies that can be characterized by an abundance of impulses related to all spheres of one's life. These attention catchers do not only engage one's concentration but also one's reaction, as individuals often have to respond to stimuli quickly and make related decisions rapidly. The increasing plethora of impulses may not enrich one's cognition and knowledge, but on the contrary, it may lead to attention crash, which can be defined as the decrease in selective concentration and wrong allocation of cognitive processes in the face of stimulus appearance.

Attention crash depends on individual and social determinants because one's attention is shaped by biological, physical, sociological, psychological, and cultural factors and consequently, people have different attention crash thresholds. The most important factor responsible for attention crash is information overload. Other terms that are used to describe the excessive quantity of information are, among others: information explosion, information overkill, information inundation, information obesity, info glut, info glitz, information dirt, information anxiety, information monster, info garbage, and information fatigue syndrome.

Information overload happens during novel situations (e.g., travel to a foreign country) that require new cognitive abilities or quick perceptions of unknown data, as well as in familiar scripts when an individual has to cope with many pieces of information simultaneously. It should be stated that not only information itself, but also the speed at which it is offered determines attention. Additionally, attention is also shaped by linguistic and nonlinguistic elements of messages. For example, novel and symbolic language devices are said to catch attention easier, whereas well-known linguistic tools often foster quicker

cognition and understanding. Taking into account the nonlinguistic dimension of information, issues such as size, color, and employed images may stimulate or hinder one's cognitive possibilities. To avoid attention crash, both information creators and recipients should be involved. Thus, those who receive information should carefully select the flow of information intake. At the same time, information overload exerts responsibility on those who create data because they should be economical as far as their content is concerned.

There are different types of information overload. The first type is called task-related information overload. It describes a situation in which a person has to go through various pieces of information to find and digest the data important for a performed task. Another type is called message overload, and it appears together with new communication media such as e-mail and social online networks. This kind of overload is connected with the magnitude of messages, each related to performing a different activity. The third type is media overload, which is related to the vast choice of media as far as channels and content are concerned.

Irrespective of the reasons causing attention crash, when attention wanes, it may lead to several short-term and long-term results. First of all, in the face of being overburdened with impulses, an individual may have problems with making proper decisions and selecting the right or needed piece of information. Second, attention decrease leads to longer response time or inability to make decisions. Third, it may also have long-lasting consequences, such as nervousness and stress.

Social Media and Politics

Attention crash is related to the technological advancement of modern times; in the past, individuals had to handle less information. Moreover, only a small percentage of people had to deal with information processing on an everyday basis. With the advent of social media and their subsequent popularity, the exposure to impulses has been increasing drastically. Individuals spend more and more time relying on and using social media. Additionally, the producers in the information industry create the need to buy newer and newer products that offer more and more sophisticated functions, although some of them are not

needed. Thus, software and hardware have to be upgraded and replaced with newer models, whereas social media offer new functions and opportunities related to their use.

Attention crash in relation to social media is also related to the lack of division between professional and private life, between duties and free time. Individuals check e-mail, write blogs, and use other social media at work and at home to be constantly updated about vocational and private issues. Information overload takes place when people are overburdened due to cyber-based and place-based sources of information. Cyber-based sources of information include information and communication activities taking place with the use of the Internet, mobile phones, smartphones, laptops, computers, personal digital assistants, and iPads. Cyber-based information overload mirrors a situation in which a person is exposed to many messages simultaneously, such as e-mails and phone conversations as well as voice and text messages. Place-based sources of information are connected with factors not of electronic origin and encompass physical environments (housing, offices, public places), commuting, environmental pollution, and so on. Place-based information overload is connected to the necessity to deal with too many professional or private issues with a lack of relaxation. It should be stressed that, although place-based sources of information have no direct online electronic dimension, they are connected with cyber-based information overload.

As far as the domain of politics is concerned, attention crash may happen as the result of constant exposure to many impulses related to political issues. Thus, politicians should remember to carefully select the number of social media and the ways they use them when contacting potential voters, supporters, or antagonists to keep the stakeholders interested in their political activities, as well as to avoid information overload and consequent cognitive problems with selecting and interpreting political information.

Audience Fragmentation/Segmentation

New technologies and the emergence of the Internet have driven the evolution of the concept of audience and inherently interrelated concepts of audience fragmentation and segmentation. While political speech in past times was almost exclusively a product of an individual's personal thinking and ability to express him- or herself, the speaker of today seems to be transformed into a number of consultants and speech writers, according to Jens Kjeldsen. He asserts that both politically and rhetorically this speech has become a polyphonic compromise, and modern media have added situational complexity, thus obscuring the traditional sense of communicator and audience.

As communicators grapple with how to make effective use of social media—often referred to as Web 2.0—techies are already preparing for Web 3.0. Web 2.0 is distinguished by Internet users' ability to interact with each other online and to produce Web content themselves; Web 3.0 will feature greatly improved interactivity among computers, making the Internet much easier for people to use, says Tom Price. He asserts that together, social media and mobile devices make public affairs communication faster and less controlled than ever before, and the impact of new media grows as a rapidly growing stream of users directs their smartphones and tablet computers to Facebook, Twitter, YouTube, blogs, and other social sites.

Michael Gurevitch, Stephen Coleman, and Jay Blumler state that, in the face of intensified competition for public attention and information, political news and analysis that might in the past have reached the most people in the course of a week's viewing can be easily missed; they assert that channel choices and time-shifting options lead not only to fragmentation of the audience but to the emergence of distinct issue publics. For example, MTV or Sky Sport viewers might not want to hear about crises in the global economy or the causes of international tensions, and they can exclude themselves from exposure to issues and forms of address that they find unappealing, disturbing, or mystifying.

Jae Lee conceptualized fragmentation as division of the audience into small clusters not communicating with each other or as the formulation of small and exclusive speech communities, where members of different communities fail to communicate across borders or to hold shared experiences; he operationalized it as the existence of a common agenda by means of incidental news exposure facilitated by structural factors of online communication in the new information environment. Lee asserts that the leaning toward audience fragmentation has arisen as one of the main concerns that might undercut a healthy democracy because fragmentation threatens democracy in that it prevents people from sharing public issues and from understanding each other, concluding that (1) several think that higher selectivity in the new information environment will motivate fragmentation in the public, leading to the decline of social cohesion; and (2) an extremely segmented public cannot discuss common social problems in a constructive fashion, much less agree on methods to solve them.

Political Polarization

Political observers are concerned that the fragmentation of contemporary news media and the proliferation of ideological cable news options may fuel opinion polarization among viewers; while enabling people to construct ideologically congruent information environments, media fragmentation also provides viewers with opportunities to select their own programming from a broad range of alternatives. Still, the implications of fragmentation seem quite problematic for the

functioning of American democracy: two strongly ideological camps on the left and right of the political spectrum, drawing upon entirely distinct bases of information, pursuing distinct political agendas and talking past each other rather than deliberating toward sound public policies on matters of collective, rather than particular, concerns. For instance, most entertainment media programs or political comedy shows, such as *The Daily Show*, *The Colbert Report*, or *Saturday Night Live*, like the news they parody, are appealing to ever more fragmented audiences.

Maxwell McCombs proposes that it is unlikely that a fragmented audience can have constructive discussions about the same social issues and reach a consensus to solve problems, and the result may be clearly deleterious for social cohesion and the proper functioning of democracy. Lance Bennett and Shanto Iyengar propose that fragmentation of the national audience reduces the likelihood of attitude change in response to particular patterns of news; as media audiences devolve into smaller, like-minded subsets of the electorate, it becomes less likely that media messages will do anything other than reinforce prior predispositions.

New Technologies and Media

In the last decade, the media and entertainment industries have experienced unprecedented levels of fragmentation, and the driving force behind this trend is the development of digital technology and the Internet. Lee recognized that new technologies have the potential to drive diversification. The heterogeneity of public opinion also grows with an increase in level of education, and the economics of the media industry and the psychology of the audience work as countervailing forces of audience fragmentation.

In today's information society, the Internet threatens to divide society into two classes, the information elite and those not linked to the Internet. It seems to be politically important because inequalities in knowledge thus lead to exclusion from social resources and inequalities in social power, as Heinz Bonfadelli claims. However, the Internet is still more an infrastructure and not a medium in the traditional sense, reaching only small segments of the population. Still, Bonfadelli asserts that, as the infusion of mass media information into a social system increases, segments of the

population with higher socioeconomic status tend to acquire this information at a faster rate than the lower-status segments, so the gap in knowledge between these segments tends to increase rather than decrease; moreover, using or not using the Internet is no longer only economic, but even more educational.

The amount of content made available by the Internet together with the requirement of active selection produces a great variety of individual, content-specific usage patterns, namely: (1) people with higher education use the Internet for informational and service-oriented purposes; and (2) people with lower education use the Internet significantly more for entertainment reasons. Still, Bonfadelli admits that there are at least four barriers to people benefiting from today's information society: (1) lack of basic computer skills; (2) barriers to access, especially as these new media are expensive; (3) further barriers because of a lack of user friendliness; and (4) gaps in the way the Internet is used, based mostly on education.

Lee recognized that changes in the media environment, exemplified by the prevalence of the Internet, have apparently raised the likelihood of audience fragmentation because people now have an unprecedented number of options for consuming their preferred media content and channels; audiences are indeed more likely to turn to media content specific to their interests under media conditions with a broader range of choices, and changes in audience behavior lead to inequality in political involvement, such as news media use, knowledge, and voter turnout.

Social Clusters

Along with changes in technology and the media, there is a greater emphasis on style, packaging, and the aesthetic form and look, and the 1980s also saw the emergence of new social clusters such as the yuppie, the career woman, and the new man, according to Christina Goulding, Avi Shankar, and Richard Elliot. They argue that at the center of all of these changes was consumption, which is increasingly a productive process, goal-orientated and purposeful, and consumption, therefore, becomes a means whereby individuals can creatively construct and express the crowd of identities that are open to them; consequently, self-postmodern is characterized as *Homo consumericus*, a creature

defined by consumption and experiences derived. Of particular interest in contemporary theory are the concepts of identity, subcultural communities, fragmentation, and the creation of meaning through consumption experiences. Still, Goulding, Shankar, and Elliot argue that fragmentation is one of the central themes of postmodern approaches to consumption, consisting primarily of a series of interrelated ideas: (1) the fragmentation and concurrent proliferation of the media; (2) the fragmentation of markets into smaller segments; and (3) the fragmentation of life, experience, and society, for instance increasing political instability, increasingly rejection of political authority, and increasing disintegrating social institutions like marriage, family, and workplace.

Mass Media Effects

Maxwell McCombs argues that it is possible that the likelihood of audience fragmentation cannot be high enough to threaten the persistence of the common agenda without meeting these two assumptions: (1) The audience-side assumption is that a good portion of the public that visit diversified Web sites for public affairs information; and (2) the media-side assumption or fragmentation hypothesis is the existence of high heterogeneity in the media agenda across different news outlets, and they can be tested on the homogeneity of the media agenda and on the assumption that diversified news media offer a variety of different agendas.

Still, McCombs recognizes that, the more one investigates the fragmentation hypothesis, the more one will understand two important questions rising with the new information environment: (1) whether mass media will still have significant effects on individuals' public lives because the new technologies have eroded the centralized nature of mass communication, which raises a question about the persistence of mass media effects; and (2) whether the Internet has positive or negative effects on people's knowledge of public issues. The possibility that new technologies drive the advent of segmented audiences and lead to society failing to have a common experience is known as the fragmentation hypothesis, McCombs says.

Some foresee enhancement of the ability to segment and target online participants and to measure online opinion and the impact of online

activities. Tom Price writes: "It will accelerate the ability to identify the exact people you want to communicate with." Andrew Lipsman and Carmela Aquino assert that social media's ubiquity and rise in popularity in recent years have largely contributed to shaping a more social environment online—not just among friends, but also between brands and consumers as well as candidates and voters. Today, social media has become an integral part of the political media landscape, growing as a primary channel for campaigns to reach out to their constituents, provide open lines of communication, and weigh in on the issues of the day (when they can't get on television, of course).

Bennett and Iyengar argue that information channels have proliferated and simultaneously become more individualized, and so it is important to understand if it is still relevant to conceive of mass media or if that concept has been made obsolete by audience fragmentation and isolation from the public sphere; under the underpinnings of communication processes, it is important to develop research that uncovers changing patterns of content distribution and new audience consumption habits. Thus, it is not surprising that media economics has emerged as one of the hottest subfields in economics, with important spillover into political communication, along with the growing numbers of studies on bias and market segmentation based on consumers' political preferences, the fashioning of news content to targeted consumer segments, and the impact of media competition on policy outcomes.

The development of cable television and the sudden increase of media outlets on the Internet have created a more fragmented information environment in which cable news, talk radio, and 24-hour news outlets compete for attention. For instance, new technologies such as Internet radio, MP3 players, podcasting, and satellite radio affect attitudes and usage of traditional radio, and naturally with choice comes fragmentation in consumer activity.

Through social media, companies can target small groups for conversations about specialized topics, Price adds, and such conversation and relationship-building can nurture networks of supporters who will listen to company arguments and may provide a third-party defense when the

firm faces criticism. Social media are about the stakeholders, not the company. Ian Morrison, president emeritus of the Institute for the Future, has said the following:

A lot of people look at this as another channel for advertising and marketing, but they're missing the point. The whole issue of social media is the consumers' controlling whom they hang out with.

Price argues that to engage in conversations effectively, an organization must relinquish some control of its employees as well. Communicators must be empowered to converse with stakeholders in real time, and online discussions will pass by any organization that requires every post to be approved by a lawyer or executive. But employees must be trained for this new challenge, and companies must prepare thoughtfully.

Nowadays, it makes sense to explore the larger democratic implications of a fragmented media environment populated with vastly different audience segments, Bennett and Iyengar say. Moreover, the more homogeneous audiences are easier to communicate with due to the similarities of their needs, which justify new audience consumption habits.

Avaaz

Before the Internet, activist organizations tended to build coalitions around one or a few related issues and use a top-down approach in their decision making. The Internet, and more specifically the tools and philosophy behind Web 2.0, now brings a new generation of activism, especially transnational activism. Activist organizations now can act much more quickly and work more easily across greater distances. Also, activist organizations can now distribute decision making across their members and can allow members to choose to support à la carte the causes they find important. Avaaz is one of the new generation of activist organizations.

Unlike new activist organizations MoveOn and 38 Degrees, Avaaz is a transnational activist

organization. It is one of the largest activist networks, with over 20 million members in over 190 countries. The countries with the largest memberships are Brazil (3.8 million), France (2.2 million), Germany (1.2 million), and the United States (1.2 million). Headquartered in New York City, Avaaz has offices in 18 cities around the world including Rio de Janeiro, Madrid, Delhi, and Sydney. Avaaz operates using thousands of volunteers and approximately 50 staff members who use e-mail, Skype, and more to create a virtual office of activists.

The word *avaaz* means “voice” in Farsi and has similar meanings in several other languages. Through its Web site, Avaaz.org, Avaaz has given voice to its members and has launched hundreds of national and international campaigns. Avaaz provides an online platform for like-minded people to raise support for an issue and then persuade governments and corporations with online petitions and sometimes in-person protests. Avaaz members take on a variety of issues ranging from climate change to corruption to human rights at the international, national, or even local level.

In 2007 Avaaz was founded and initially supported by MoveOn, a progressive online activism group, and Res Publica, a British public policy think tank. The founding team consisted of several individuals, including founding president and executive director Ricken Patel. Since 2009 Avaaz has accepted no governmental, corporate, or other outside support, relying instead solely on small donations from its millions of members. As the founding architect of Avaaz, Patel, a Canadian, drew upon his past experiences to lay the foundation for Avaaz. Before Avaaz, Patel worked with International Crisis Group, a nongovernmental conflict resolution organization, in the war-torn countries of Afghanistan, Liberia, Sierra Leone, and Sudan. He then volunteered with MoveOn where he gained an understanding of online activism. In 2012 *Foreign Policy* listed Patel as one of the top global thinkers.

Campaigns and Activities

Campaign ideas come from Avaaz members, not Patel. Members submit a petition to the Avaaz staff, who then send the petition to a random sample of 10,000 members. If the petition gains

enough support it is then sent out to all members via e-mail alerts. The petition is also sent out via social media to garner more support and potentially more members. On Twitter Avaaz mainly tweets about campaigns and often asks readers to sign petitions and retweet posts. Facebook is used a little differently. While information on campaigns is included in posts on Facebook, Avaaz also posts activism news from its new activism-oriented news site, *Avaaz Daily Briefings*. Avaaz has 601,000 “likes” on Facebook and 484,000 followers on Twitter.

Once petitions gain enough signatures, sometimes millions of signatures in a few days, the subjects of the campaigns, usually government or corporation leaders, are shown the petition and signatures to persuade them to take action to address an issue. If they do not respond to the petition, Avaaz then takes action in the form of in-person protests, sit-ins, rallies, marches, flash-mobs and other creative media stunts. Avaaz may also put ads in various media.

For example, in 2011, a petition on sex trafficking in hotels had gained enough signatures and support from Avaaz members to present the petition to Hilton Hotel officials. The petition with 317,000 signatures requested that Hilton train staff to identify guests who are victims of child sex trafficking. When Hilton officials were slow to respond, Avaaz said it would put ads in the hometown newspaper of Hilton’s chief executive officer. Hilton agreed to take action.

Since its founding in 2007, Avaaz has taken on other campaigns related to human rights, like a campaign in response to rapes in India and a campaign for funding education for poor children in Pakistan. Avaaz has also taken on environmental issues like climate change and animal rights, including stopping an international whale-hunting ban from being overturned. Avaaz has also taken on corruption in countries like India and Brazil.

In 2011 during the Arab Spring, Avaaz moved beyond petitions for change and took a more direct role in Syria. Initially Avaaz raised \$1.5 million from 30,000 members to support citizen journalism during the Arab Spring. Avaaz began by sending cameras, satellite phones, and satellite uplink equipment to the protesters in Syria. It then sent in people to train protesters on how to

Alex Wilks, a representative from the international nongovernmental organization Avaaz, presenting 2,442,240 signatures against the Anti-Counterfeiting Trade Agreement (ACTA) to the European Parliament's petitions committee on February 28, 2012. He stands alongside Green Party Members of the European Parliament Margrete Auken, Sandrine Belier, and Eva Lichtenberger.

use the equipment and how to do citizen journalism to help get the news out to the international mainstream media. Using the network of activists it developed in Syria, Avaaz also smuggled in medical supplies and dozens of international journalists. And, when those and other journalists were under fire and needed to leave Syria, Avaaz helped evacuate them. The journalists were safely evacuated from Syria, but 13 Syrian activists lost their lives in the process.

Avaaz has faced criticism for its work, including the criticism that it ventured beyond its capabilities with its actions in Syria. In addition, critics of online activism like Evgeny Morozov have referred to online activism as slacktivism or clicktivism, implying that members of such organizations like Avaaz put forth very little effort and are not significantly engaged in an issue. Opponents have also claimed that Avaaz is a progressive organization funded by George Soros. Patel

states that if Avaaz has an ideology, it is practical idealism, with Avaaz taking action to do good in the world.

Avatars

An *avatar* is an online representation of a human user. The term is derived from a Sanskrit word for the physical incarnation of a Hindu god, first used to describe the digital version of a human user by the designers of Lucasfilm's *Habitat*, an early virtual world from the 1980s. In *Habitat*, avatars were two-dimensional animated figures through which users would interact with others and the digital environment. Beyond online worlds, Neil Stephenson's 1992 cyberpunk novel *Snow Crash* depicted a virtual reality called the Metaverse in which an individual's social position was determined by the appearance of his or her avatar. In these early examples, an avatar was always a visual, graphical representation of a user. In more recent years, avatar has been used to describe nearly any representation of a user—textual, visual, or otherwise—not only in virtual worlds but in forms of social media as diverse as Internet forums, blogs, or social networking Web sites.

A user constructs an avatar so others can identify him or her as a unique and distinct individual online. An avatar usually has a visual or textual form that is mutable yet remains consistent over time. Consequentially, it both does and does not correspond to the physical body of the user behind the screen. A user of virtual worlds often identifies his or her real self as the one constructed and embodied online through the avatar. An avatar grants users the ability to play with, perform, or otherwise transform identities in ways impossible for physical bodies, often through a strategic veil of anonymity. This latter attribute of avatars has been identified as both a political strategy for a more egalitarian society and a threat to the democratic potential of the Internet. While early studies of cyberculture celebrated the possibilities enabled by avatars, questions of anonymity and

identity have become increasingly prominent in debates about the politics of virtual worlds and social media, placing avatars in the center of current political debates about the Internet.

Avatars, Identity, and Representation

Because users construct their avatars, they can subsequently play with or try on different identities through their virtual bodies. Users can have multiple avatars, shifting between selves in a way that permits users of virtual worlds to embrace a kind of digital schizophrenia. Early theorists of cyberculture argued that the possibilities of online identity enabled by avatars reveal how people's identities are not stable but are flexible and constantly shifting. The avatar is not simply a representation but a real manifestation of the fluidity of people's own identities. Because of this fluidity, these theorists forecasted a future in which racism, homophobia, and other forms of discrimination based on identity would wane because of the ability to remake one's identity online through disembodied avatars.

Recent studies have determined that possibilities enabled by avatars are not as fluid as initially thought. Prejudice against fat and non-white avatars still remains even with the variable, virtual body of the avatar. Because identity can be changed online, marginal identities are often completely erased in virtual worlds. Rather than enabling a more equitable way of understanding identity through digital representations, avatars reproduce—if not exacerbate—the prejudices about identity already present in the offline world. Because prejudices still exist online, users may choose to represent their identities in ways that simply repeat privileged identity categories. If and when marginal identities are represented online, they often are so via drop-down menus that do not permit fluid manifestations of identity. Non-white and nonmale avatars are often represented through reductive and stereotypical caricatures, especially when users pass as a race or gender that is different from that of their own bodies.

Avatars, Activism, and Anonymity

The anonymity of the avatar, however, still has a massive significance for the political agency of Internet users. Avatars in virtual worlds, on blogs, and on social networking Web sites permit their

users to express their personal voices in the face of repressive social and governmental regimes. While avatars may erase specific populations from online representation, they also, perhaps paradoxically, enable an individual to manifest as visible to others while minimizing very real possibilities of violence that minorities and otherwise oppressed individuals may face. This use of avatars is most commonly associated with sexuality, gender, and political activism. Gay individuals can out themselves online while remaining closeted beyond the Internet, protecting themselves from very real threats of physical violence. Female bloggers in the Middle East use the anonymity of avatars to gain some form of liberation, most often through self-expression, while still living under otherwise repressive governmental, social, and religious norms. Through avatars, activists can visibly organize and protest online while remaining beyond the reach of police power.

Avatars, however, are not nearly as anonymous as often perceived by the users and theorists of social media. Not only does the informatic structure of the Internet enable the tracking of individuals, but also avatars are almost always constructed within private, for-profit Web sites and services that have little interest in challenging established governmental and social norms. The political economy of social media privileges the identification and fixing of identity, not its continued fluidity. And, the anonymous nature of the avatar is increasingly understood to disrupt the possibilities for a democratic civil society fostered by the Internet.

A number of recent Internet policy analyses have suggested that bodily identity be definitively linked with online representations of the self. The anonymity of avatars is believed to empower cyberbullies and Internet criminals along with political dissidents. Avatars that do not represent

In an elaborate example of an avatar based on a human user, as many early avatars were, these U.S. Navy personnel at the Office of Naval Research at Camp Pendleton, California, in September 2010 demonstrate an apparatus that creates a 3-D avatar of the user for training purposes. The “mixed reality” training system used here is an Afghan environment “Infantry Immersion Trainer” for U.S. Marines.

the true bodies and identities of the user are false sockpuppets that can spread disinformation, challenging both established governmental order as well as the coherence of activist groups. The increasing prominence of these arguments challenges the belief that the anonymity of avatars is a political good. It seems that social networking Web sites, Facebook in particular, are moving toward this understanding of identity in the policing and regulation of user profiles. While the avatar has long been a feature of online sociality—and will most likely continue to be so for years to come—its fluidity and anonymity are increasingly problematic in understanding the relationship between social media, governance, and political agency.

B

Bachmann, Michele

Barack Obama's deft use of social media as a cornerstone of his 2008 presidential bid helped him win the election. Social media not only allowed the Obama campaign to build a network of small donors but also empowered it to appeal to younger and first-time voters, who were better able to identify with the candidate through social media tools. Through Facebook and Twitter events, these "inexperienced" voters felt a stronger connection to Obama the candidate—an identification that is made more difficult in a televisual, talking-head context in which the candidate is often interviewed by middle-aged media elites. The 2008 presidential campaign proved the success of social media as a coalition-building, base-empowering technology. Since the Obama victory, Republicans have followed suit in taking to social media to directly engage their constituencies. Among those who have made good use of social media in recent campaigns is Minnesota Congresswoman Michele Bachmann. Bachmann is also the founder and chair of the Tea Party Caucus, a 61-member coalition of Republicans, 17 of whom were first-term members elected in the 2010 midterm elections.

Through her use of social media, Bachmann managed her persona as a political outsider devoted to her evangelical Christian faith and

traditional values. Bachmann is notable for her general strategy of avoiding appearances on mainstream news programs, preferring instead to appear on sympathetic media outlets like Fox News and Christian-based television and radio channels. Bachmann generally does not write op-eds in national newspapers or appear on mainstream news. Instead, she shapes her message by distributing dispatches directly to her social media audience through tweets and Facebook status updates. Bachmann's provocative statements are ready-made for headlines, news talk programs, and the Twitterverse. Social media allow her to appeal directly to her followers and display her personality, while also engaging her critics, who further circulate her message and draw attention to her and her positions. Their attacks help Bachmann to position herself as an outsider, a victim of a censorious, elite media unconcerned with the values of common folks. This strategy works well at galvanizing her base of social conservatives who identify as having "traditional," Christian-centered values.

During her 2010 re-election campaign Bachmann used mobile attack ads against her opponent at the Minnesota State Fair—the second-largest state fair in the United States and a prime event for elected officials to target a multitude of voters. Her campaign created short, fair-themed YouTube videos targeting voters at the

Michele Bachmann in October 2011. One theory about her poor showing in the 2011 Iowa caucus after having won the first Iowa straw poll is that her reliance on social media over traditional media left her unable to sustain her momentum with Iowa voters.

fair. Recognizing that many fairgoers would have smartphones capable of viewing YouTube content, the campaign created videos that asked fairgoers why they should support her opponent, who supported raising the price of food and drink items purchased from food vendors—an omnipresent sight at the state fair. The strategy demonstrated that Bachmann and her campaign staff were able to capitalize on very specific opportunities.

Iowa 2011

In the following year, 2011, Bachmann, buoyed by her first-place finishing in an Iowa straw poll measuring support for Republican candidates to challenge Barack Obama for the 2012 presidential election, began devising her social media strategy to appeal to Iowa conservative and Republican voters—many of whom, like Bachmann herself,

identified as evangelical. Bachmann embarked on a bus tour that visited each county in advance of the caucus. Because caucus rules and procedures are more arcane than are those of the more straightforward primaries (which proceed much like a general election does), and because only 15 states hold caucuses for nominating presidential candidates, they challenge candidates to make sure voters, especially first-time ones, are familiar with the rules for participation. To this effect, the Bachmann campaign attempted to make use of the popular Facebook application Farmville to help game users spread the word about the Bachmann campaign. The Bachmann Farmville application encouraged game players to knock on the doors of other player's farms and place virtual Bachmann signs in players' front yards. It is unknown to what extent the Farmville venture was successful in courting younger voters or even what percentage of Iowans actively played games on Facebook. The use of Farmville does suggest, however, that the Bachmann campaign felt comfortable enough with social media applications to employ tactics her rivals did not.

The Bachmann team posted videos from their bus tour to YouTube to serve as a guide for spreading the word about the Bachmann campaign as well as for how and where to participate in the caucus process. The YouTube video strategy also allowed the Bachmann campaign to save money on the costs of direct mail and television ads. This cost-saving gambit works so long as a targeted constituency makes frequent use of social media. Bachmann's campaign floundered in Iowa as Bachmann followed her first-place finish in the first straw poll with a sixth-place finish in the caucus elections. Evangelical voters were disproportionately represented in Iowa compared to the rest of the country. Depending upon which poll scholars rely, evangelicals made up roughly one-quarter of all Republican voters. Bachmann primarily appealed to these social conservatives.

It is not clear why Bachmann went from first to finishing sixth in Iowa. It is likely that her overreliance on social media, including YouTube, with its comments section providing space for her supporters to respond to campaign messaging, and her underutilization of paid television spots, and more important, her refusal to engage in candid interviews with mainstream news sources limited

her access to likely Iowan voters and lessened her appeal among big donors. The Bachmann campaign's bodyguards reportedly prevented journalists who were not preapproved to ask her questions or photograph her. If recent history is any sort of guide, Republicans who appeal to evangelicals tend to do well in the Iowa caucus, with Mike Huckabee winning in 2008 and Bachmann's rival for the hearts of evangelicals, Rick Santorum, triumphing in the most recent Iowa caucus. History also shows these candidates tend to struggle to appeal to a broader coalition of voters after the Iowa caucus. Santorum, by all accounts, relied upon a more traditional media campaign—including multiple television interviews—to fortify support behind his candidacy.

Iowa was a compelling litmus test for the Bachmann campaign because it demonstrated the importance of assembling a broad coalition of supporters, including those less conservative Republicans who vote primarily on economic issues. Though Bachmann is an experienced tax lawyer, can speak about fiscal policy, and is the darling of many Tea Party members for that reason, she primarily pitches her messages to fellow social conservatives. Frequently absent is an explicit appeal to moderate or independent-minded voters. Her entire New Hampshire staff resigned before the primary there due to concerns about Bachmann putting too much focus on those selfsame Iowa voters. Bachmann's campaign manager resigned during the Iowa campaign, which further complicated Bachmann's ability to appear to be the momentum candidate. Without big donors paying for television spots, and with Bachmann's near refusal to submit to candid, live interviews, her social media strategy for getting out the vote was not nearly enough to sustain her momentum forged from the results of the first straw poll.

Backlash

The New Media Index from the Pew Research Center for Excellence in Journalism noted that, after Bachmann officially announced her candidacy for president, she was the most popular subject on political blogs as well as being one of the most popular subjects on Twitter. To be dominant on both platforms simultaneously is unusual, though the content circulating among political blogs was almost uniformly negative. With Bachmann's

formal announcement came increased press scrutiny, including the revelation that she and her husband, a therapist, had separately received generous farm subsidies and Medicaid payments, respectively. Also in question was whether her husband, Marcus Bachmann, practiced controversial and discredited "gay conversion" therapy. In addition, Bachmann committed a faux pas in her hometown of Waterloo when she declared it the home of John Wayne, when in fact it is actually the onetime home of serial killer John Wayne Gacy. The popular sentiment circulating around the blogosphere seemed to call into question Bachmann's intelligence and her mainstream appeal. The increased scrutiny of Bachmann's private life prevented her from adequately controlling the message of being a political outsider whose interests lie with Americans holding traditional values.

Bachmann's messaging—both in social media and through planned media appearances—sparked backlash from those not sympathetic to her positions. While preparing for candidate debates, Bachmann appeared on the popular late-night television show, *Late Night With Jimmy Fallon*, which was an uncharacteristic media move for her. Fallon unlikely shared a target audience with Bachmann. As Bachmann emerged from the green room to do her segment, The Roots, Fallon's house band, played a cover of a Fishbone song "Lyin' Ass Bitch," though those lyrics were not sung during Bachmann's introduction.

The Roots have a history of playing tongue-in-cheek songs that are topical to the featured guest. After the show, when the song's significance became apparent to Bachmann, she demanded an apology from NBC and further displayed her outrage during a subsequent appearance on Fox News. Fallon issued a tweetpology by tweeting his regrets about the introductory song played during Bachmann's entrance. The Fallon experience challenged Bachmann's control over her messaging, which was much more difficult to accomplish through broadcast media programming, which appeals to a broad audience. Too, it provides an example of why Bachmann tended to avoid engaging in those media opportunities. In this regard, Bachmann preferred not to use social media defensively—that is, to conduct damage control and manage impressions of a gaffe or humiliating media moment after the fact. Instead,

Bachmann preferred to use social media to get ahead of her direct-to-constituent message and thus maintain more control over it.

Bachmann also made waves by asserting that the human papillomavirus (HPV) vaccine causes mental retardation and calling for Sharia law, the practice of an ultraorthodox form of Islam, to be outlawed in the United States. Perhaps most controversially she accused Huma Abedin, a Muslim woman who served as deputy chief of staff for Secretary of State Hillary Clinton, of having ties to the Muslim Brotherhood. Many, including noted Republican leaders John McCain and Speaker John Boehner, saw this as a baseless attempt to pass guilt by association. Notably, Bachmann took to Fox News and to her social media accounts to level the same charge of having associations with the Muslim Brotherhood against fellow Minnesota representative, and the first Muslim elected to the U.S. Congress, Keith Ellison. Ellison made waves among some conservatives, including Bachmann, by taking his oath of office with his hand placed on the Quran. Despite bipartisan expressions of disappointment, even outrage, over Bachmann's comments, she did not lose favor with her constituencies. But, notably, she did not expand her constituencies either.

Conclusion

Social media provides unprecedented means for reaching and dialoguing with one's followers. The most successful politicians are able to deftly combine both social and traditional broadcast media with its diverse audience to build the largest possible coalition in order to expand both the breadth of their audiences and the depth of loyalty those audiences hold for them. Bachmann is a unique case who seemed, especially after her defeat in the Republican primaries, to have been concerned principally with cultivating her loyal constituency.

Backchannel

The term *backchannel* refers to any digital communications tool that facilitates conversation away from public view. As opposed to Stewart Brand's famous phrase, that "information wants to be free," network backchannels provide an architecture within social media for maintaining privacy and secrecy. The most common backchannels are invitation-only e-mail lists operated through services like Google Groups or Yahoo! Groups. Restricted-access threads on bulletin boards and moderator-only discussion spaces on large blogs and wikis also act as backchannels. The central characteristic of backchannels is that they enable conversation among formal, semiformal, or informal networks while also maintaining barriers to public viewing. Due to the ease with which these network backchannels can be formed, they play a substantial, but hidden, role in social media-driven political campaigns. Both their existence and the challenges they create for researchers significantly complicate academic understanding of the Web.

Examples

The best-known backchannel is the (now defunct) JournoList listserv, which was shut down after a controversial leak in June 2010. JournoList was a Google Group launched in February 2007 by Ezra Klein, a popular journalist and blogger who then was working at *The American Prospect*. The list was composed of left-leaning journalists, policy experts, and academics generally known personally by Klein himself. Between 2007 and 2010, JournoList grew to include approximately 400 individuals. Conversations on the off-the-record

list spanned a wide range of topics, from policy details to sports and entertainment media. Klein describes the theory behind JournoList as “an insulated space where the lure of a smart, ongoing conversation would encourage journalists, policy experts and assorted other observers to share their insights with one another.”

In June 2010, JournoList e-mails by *Washington Post* blogger David Weigel were leaked to two blogs, FishBowlDC and the Daily Caller. The e-mails featured off-color comments about conservative activists who were part of Weigel’s regular beat. Within days, he was forced to resign from the *Post*, and leading conservative bloggers seized on the case as evidence of a liberal media conspiracy. Conservative commentators viewed the backchannel as a place for journalists to agree upon liberal news frames and squash inconvenient stories. JournoList participant, and *The Atlantic* national correspondent James Fallows, countered by asking, “Have you ever been on a listserv? . . . It had all of the virtues, and many of the faults, of the standard Internet e-mail list.”

Key Features

JournoList displays several features common to all backchannels. It is a digital instantiation of a traditional phenomenon: In decades past, networks of journalists would gather for dinner parties, or the “boys on the bus” who traveled with the presidential campaigns would meet for beers in their shared hotels. Today, these network ties take on an additional, digitally enhanced form. The creation of a backchannel e-mail list cultivates the same network-based conversations that have always occurred among journalistic professionals and their key sources. It is now easier to cultivate these ties, however, and their digital form creates novel opportunities and threats.

Network backchannels are publicly opaque but permeable. This makes them distinct from official organizational listservs, which are publicly visible but closed. Most backchannels include a version of “Fight Club Rules” that caution list members from discussing the list’s existence in public. As such, a potential backchannel list member is unlikely to know of the list’s existence until he or she receives an invitation to join. Compare this to the e-mail list for the *Washington Post* editorial board. This is a publicly visible entity—editorial

board members are displayed on the organization’s Web site, and it is no shock that they communicate via e-mail. But, potential members face a much higher barrier to entry. From 2007 to 2010, JournoList grew to approximately 400 people. The *Washington Post* editorial board’s membership size remained stable.

The opaque nature of backchannels like JournoList also make them nearly impossible to study. Though it was intermittently mentioned in news reports from 2007 to 2010, the list’s Fight Club Rule meant that scholars, practically speaking, could not treat it as an object of study. What’s more, the ease with which a backchannel listserv can be constructed makes it impossible to estimate the size of the backchannel universe. One month after JournoList was shut down, Jeffrey Goldberg reported that a new backchannel list had replaced it. As such, network backchannels display a Russian nesting doll character—there can be backchannel lists within backchannel lists, ad infinitum. These limits on scholarly capacity to observe backchannels lead them to generally be omitted from scholarly discourse on social media.

Criticism

There are two major critiques of backchannels—one normative, the other practical. The normative critique holds that backchannel lists subvert the online norm that everything should be public. In online communities and discussion boards that revel in the free flow and sharing of information, exclusive backchannel discussions would appear to violate the norm of publicness. Conservative bloggers hold that private online conversations among journalists and academics constituted a breach of journalistic ethics. Social media optimists who view unchecked online participation as a social good may voice concern that backchannel lists replicate traditional, exclusive hierarchies that the new medium might otherwise subvert.

The practical critique holds that, unlike old, informal networks of information exchange, these lists create digital traces that can themselves be problematic. Weigel’s statements about the conservatives he interviewed were uncontroversial in context, but detached from their temporal and conversational space, they took on a very different meaning. “Off-the-record” conversations left no formal traces in the predigital era. Today,

such conversations can be leaked, mined, and exploited in new and troubling ways.

The flood of publicly available social media activity leads many observers to presume that the dictum, “information wants to be free,” has come to pass. The existence of backchannel lists provides a rebuke to that presumption. Backchannel communications and coordination efforts occur online but out of sight. For practical reasons, this leads social media theorists to rarely consider them or factor them into theories of online communication. They remain a useful and frequently used tool and should be treated as such.

Bahrain

Similarly to what happened in other countries that were part of the Arab Spring, social media played an important role in the 2011 and 2012 unrest in Bahrain, which was dubbed the “pearl revolution” by the media because of the tradition of pearl hunting in the small Gulf nation. Beginning on February 14, 2011, thousands of protesters took part in demonstrations that culminated in a month-long occupation of the so-called Pearl Roundabout in the capital Manama. In the course of this protest wave, a number of social media, from social networking sites such as Facebook and Twitter to video platforms such as YouTube and Bambuser, as well as blogs, Internet forums, and chats, were widely used by activists to mobilize people, to coordinate among themselves, and to inform the news media and audiences both at home and abroad about the unfolding events.

The Kingdom of Bahrain (which means country of the two seas in Arabic) is a small state composed of 33 islands on the western coast of the Persian Gulf and is a short distance from Qatar to the east and Saudi Arabia to the west. The biggest of these islands is Bahrain Island, where the capital Manama is located and where the majority of the country’s 1,234,000 population lives. A former colony of the United Kingdom, Bahrain hosts a strategic U.S. naval base where the Fifth Fleet is anchored. Similarly to its neighbors, Bahrain is a very affluent country, with a per-capita gross domestic product as high as the European Union (EU) average. However, wealth is unequally distributed, and most of the economic and political power of the country is in the hands of the Sunni minority, numbering around 25 percent of the population, with the Shia majority harboring a number of grievances.

Politically, Bahrain is a constitutional monarchy, currently ruled by Hamad bin Isa Al Khalifa, who has been on the throne since 2002. Despite a slow path of democratization begun with the first parliamentary elections in 1973, the king continues to enjoy almost absolute power in the country. The sovereign appoints all the ministers, including the prime minister, is the commander of the military, presides over the court system, and has the power to dissolve the lower house elected chamber and to appoint the members of

the upper house of parliament. Almost all the members of the government, including the prime minister, come from the king's family. The representation of opposition is limited to authorized parties, like the Shia el-Wefaq and the secular Wa'ad, while more radical forces like the Haq movement are banned.

Corresponding to its level of wealth, Bahrain enjoys high rates of connectivity and social media penetration. According to World Bank data, in 2011 more than 80 percent of the population was Internet connected. Social media were also widely accessed as testified by a 34 percent Facebook penetration rate in the same year, according to the *Arab Social Media Report*. These figures put Bahrain together with Kuwait and Qatar among the most Internet-connected countries in the Arab world and far above countries like Egypt and Tunisia.

2011 Uprising

The 2011 uprising in Bahrain developed on the back of the events in Egypt and Tunisia. Moreover, the movement built on the experience of previous uprisings against the monarchy in the mid-1990s and the mid-2000s. A day of rage was called on February 14. This date was chosen for being the 10th anniversary of the contested constitution of 2002, which had been imposed by King Hamad without consultation, and which has been compared to the constitution of 1973, severely limiting the power of elective institutions.

In anticipation of the first day of protest, calls for participation flowed through Facebook pages, Twitter accounts, and blogs, which made up for the lack of strong opposition from newspapers, radio, and television. Thousands of protesters took part in the march, which was immediately met with a violent response from police. The following day, demonstrators occupied the Pearl Roundabout in Manama and set up a protest camp in imitation of Tahrir square. The occupation continued until the morning of February 17, known as Bloody Thursday, when the police raided the camp and killed four protesters.

After reoccupying the roundabout on February 19, the movement swelled in the subsequent days, with several marches of more than 100,000 people between the end of February and the beginning of March. Most of the participants in the movement

were of Shia origin, and an important role in calling the demonstrations was played by Shia clerics. But, the movement vehemently rejected the label of sectarianism that was used against it by the ruling regime. The protesters called in their majority for an overhaul of the political system in Bahrain with more power to elective institutions.

Response

Faced with the tenacity of the mobilization, the Bahraini government tried to placate demonstrators by making some concessions, including removing unpopular ministers. But, in mid-March it launched a full-scale crackdown against the movement, with the crucial support of Saudi Arabia and United Arab Emirates troops. On March 15, the king declared a state of emergency. On the following day 5,000 security forces with aerial support and tanks rolling on the ground stormed the Pearl Roundabout, whose central pearl monument was later demolished. Most demonstrators retreated in face of overwhelming force, and 1,000 were arrested.

In the following weeks and months, the government successfully used its repressive force to subdue the movement, arresting organizers, firing public employees sympathetic to the movement, and erecting checkpoints around poor Shia villages. But, after a phase of relative latency, with smaller demonstrations in the second half of 2011, the movement made a comeback in the early months of 2012. More than 100,000 took to the streets on March 9, 2012, in what was publicized as the biggest demonstration since the birth of the movement. Moreover, a number of protests were scheduled in the run-up to the Bahrain Grand Prix in April in an attempt to force its cancellation, as happened the previous year.

In the course of the wave of protest, social media constituted the medium of choice for the movement. In advance of the February 14 protests and in the following days, activists created dedicated Facebook pages and events to publicize the demonstrations. Twitter hashtags like #bahrain, #14feb, and #feb14, with messages written both in Arabic and English, were used to exchange information and to galvanize morale. Mobile phone networks were used to circulate practical information, such as locations of assembly points and emergency updates. Videos channeled through

YouTube and the live-streaming service Bambuser documented the numerous human rights violations committed by police.

Social media-powered citizen journalism was particularly important in the case of Bahrain because of Al-Jazeera's cold response to the uprising. The Qatar-based Arabic broadcaster gave the uprising in Bahrain much less coverage and sympathy than the uprisings in Egypt and Tunisia, to whose success it had strongly contributed. The network was accused by Bahraini activists of a double standard, and commentators argued that Sheikh Hamad, the ruler of Qatar, feared a contagion to his own country.

Activists

Crucial in driving social media campaigning was the close-knit community of digital activists and bloggers who had been developing in Bahrain since the early 2000s. One of the initiators of this activist community was Mahmoud al-Yousif, an engineer working in the information technology sector who came to be known publicly as BlogFather. Since 2005, Yousif used his blog to protest against sectarian segregation and to campaign in favor of freedom of expression. He soon became a target of repression by the state apparatus until he decided to abandon blogging in 2008. He was arrested in March 2011, during the crackdown against the movement.

Another prominent pioneer of digital activism in Bahrain is Ali Abdulemam, a computer engineer by profession and the founder of the online forum Bahrain Online. Established in the late 2000s, Bahrain Online has attracted tens of thousands of members and hundreds of thousands of daily visitors, who debate Bahraini politics and society on its numerous discussion threads. Since the uprising, the Web site has cast itself as the media center of the revolution and has been banned by the government. Abdulemam, who was arrested in 2010 during a crackdown against prodemocracy activists, was released on February 23, 2011, after a week of protests as a demonstration of goodwill from the government, but he was rearrested during the ensuing crackdown.

Besides blogs and Web forums, in recent years social networking sites such as Facebook and Twitter have been increasingly adopted as propaganda and agitation tools by prodemocracy

activists. Possibly the most famous activist tweep in Bahrain is Zainab al-Khawaja, the daughter of Abdulladi al-Khawaja, a prominent activist and the cofounder of the Bahraini Center for Human Rights. Zainab al-Khawaja maintains a popular Twitter feed in English called @angryArabiya, which counted more than 30,000 followers in early 2012. Another famous Twitter user is Nabeel Rajab (@NABEELRAJAB), cofounder with Zainab's father of the Bahraini Center for Human Rights and its current director, who was sentenced in 2012 to three years in jail because of the content of his tweets.

Censorship

The Bahraini monarchy, cognizant of the important role played by social media in the movement, has repeatedly targeted digital activists and connected accounts and Web sites. This repressive campaign has led Reporters Sans Frontieres to put Bahrain on its list of enemies of the Internet alongside countries like North Korea, Iran, and Belarus.

Since the beginning of the uprising, many bloggers and social media activists have been arrested. On June 22, 2011, 21 bloggers went on military trial for a number of charges, including defamation and insults to the king and the royal family, inciting hatred against political institutions, inciting people to commit violent crimes, misuse of social media, and defaming public figures on social media. Eight of them were handed life sentences, while the remaining 13 faced between two and 15 years of imprisonment.

Apart from legal prosecutions, digital activists have also been subject to police violence, including at least two killings. On March 31, 2012, Ahmed Ismael, a citizen journalist who had reported several episodes of police violence on YouTube, was shot dead by a plainclothes policeman. On April 9, 2011, Zakariya Rashid Hassan al-Ashiri, a blogger, was killed while in police custody, though the official version claimed he had died due to illness. The blogger Sayid Yousif al-Muhafdah has been reported missing since March 19, 2011.

The Bahraini regime has repeatedly attempted to censor the Internet through its control of BIX, the Bahraini Internet exchange. The authorities did not operate a full-scale "kill switch" of Internet communications as in the case of Egypt. Nevertheless, Internet connection in the country

Women demonstrating for the release of political prisoners in Manama, Bahrain, in the Pearl Roundabout on February 19, 2011, two days after a government crackdown at the site had led to the deaths of four protesters. That year, Bahrain was one of the most Internet-connected countries in the Arab world, with over 80 percent of its population online, and with 34 percent using Facebook.

was severely disrupted by state authorities in the attempt to weaken movement communication, with a study from Arbor Networks observing a 20 percent slowdown in mid-February 2011. The government targeted activist accounts on live-streaming Web sites like Bambuser and antigovernment pages on Facebook. Moreover, it blocked chat services like PalTalk and Internet-based chats and forums like Bahrain Online, which were used by activists to communicate. A number of Web sites denouncing human rights abuses were closed down since the start of the protests, with only a handful of them being unblocked in early 2012.

Apart from censoring prodemocracy communications, the regime of King Hamad has also tried to turn social media mobilizing potential in its own favor. Supporters of the regime created Facebook pages and Twitter accounts that were used to publicize loyalist demonstrations, such

as the Gathering of National Unity on February 22, 2012. Proregime Internet users, suspected of being bankrolled by the regime and its intelligence service, trolled activist pages in an attempt to intimidate prodemocracy activists. Pictures of prodemocracy demonstrations posted online were used to identify famous personalities among the protesters, including football players, artists, and academics and to shame them publicly.

At the end of 2012, the prodemocracy movement in Bahrain continued to remain active in the face of overwhelming state repression. The regime had unsuccessfully attempted to initiate a dialogue toward reconciliation with the opposition, and the conflict remained unsolved. Notwithstanding the arrests, killings, torture, and intimidation, the community of digital activists and social media activists that has played a crucial role in the uprising also continued to be active and to maintain a

number of channels to fuel dissent and organize protest against the regime.

Bambuser.com

Bambuser.com is a video streaming service that allows users to record, share, and watch live video captured by cell phones and computer cameras. These videos can also be shared on popular social media Web sites such as Facebook, Twitter, and Tumblr. Although the Bambuser application (app) was initially designed for social use, political activists in the Middle East have used the service to document government wrongdoing.

Bambuser.com was founded in Stockholm, Sweden, in 2007 by 12 self-described “ninjas”; the company is still run by its small staff, and currently operates an additional office in Finland. According to Bambuser’s Web site, its mission is to provide an easy and inexpensive way for individuals to “share moments with the world through real-time video.” In accordance with

this, the company provides its services for free to charitable organizations and individuals. However, news organizations and corporations that use Bambuser must purchase a premium service.

In 2012, the Associated Press (AP) partnered with Bambuser after using its footage for more than three years; the agreement allows the AP to distribute footage from Bambuser’s users to major media outlets. So far, the AP has used crowd-sourced Bambuser footage in its coverage of several high-profile events, including the civil war in Syria and the 2013 Boston Marathon bombings.

In 2011, the Bambuser app was one of the most popular apps downloaded on smartphones. Although Bambuser.com is not the only service that allows users to stream live video, it has gained popularity due to its ease of use. To use the service, an individual first creates an account, and then downloads the Bambuser app. Then, the user is able to stream video from a smartphone; moreover, the app allows users to stream even in low-bandwidth environments.

In addition to its streaming video app, Bambuser also maintains a Facebook page, a Twitter feed, a blog, and an online video archive. The company’s founders use social media to update users on the role of the service in broadcasting from global conflicts.

Use by Activists

Although most Bambuser.com users employ the service to share personal videos, the company has become a tool for activists and citizen journalists, especially in the Middle East. Specifically, in several countries that have experienced political uprisings during the Arab Spring, activists have used Bambuser to document government atrocities and political corruption.

For example, in Egypt during the 2010 parliamentary elections, activists uploaded videos documenting large-scale election fraud; 10,000 videos were uploaded in a single day. In January 2011, during the massive protests in Cairo against the regime, activists used the service to document police brutality; subsequently, the Egyptian government shut down access to Bambuser. In response, Bambuser set up a channel devoted to airing video footage from the protesters. After the collapse of the Hosni Mubarak government, Egyptian activists used Bambuser to document the

November 2011 parliamentary elections. Prior to the elections, two of the founders of Bambuser traveled to Egypt to help train activists to use the service to monitor for fraud.

Antigovernment activists in Syria have also used Bambuser's streaming services since the start of the civil war in March 2011. Opponents of the regime of President Bashar al-Assad used the service to document events such as funerals, bombings, and attacks on civilians by government forces. Although the Syrian government has banned Bambuser and arrested those who have the app on their phones, users have relied on satellites or wireless networks in Jordan and Turkey to stream video.

Overall, most of the live-stream videos from Syria are submitted by men ages 12 to 20. In addition, one of Bambuser's busiest times is Friday afternoons, the Muslim day of prayer, since many activists stream footage of demonstrations in the streets as people leave mosques.

Since it is difficult for journalists to cover the Syrian conflict, videos taken by Bambuser users from Syria have been shown on many major news networks, including the BBC, CNN, AP, and Reuters. For example, one Syrian activist broadcasted live during a mortar attack in Homs; this video was broadcast on 80 networks and was shown 600 different times. Bambuser has been used by other activists in the Middle East, and was temporarily banned in both Bahrain and Turkey. It has also become an outlet for anti-Vladimir Putin supporters in Moscow, and has been used by Occupy Wall Street protesters, who hope to document inappropriate police conduct.

Berkman Center

The Berkman Center for Internet and Society is a research center at Harvard University whose mission is to understand and explore cyberspace. It was founded in 1998 at Harvard Law School. Berkman Center focuses on the study and assessment of cyberspace's development and dynamics as well as on relevant laws and sanctions. Moreover, it is interested in the relation and interaction of Internet-related technologies with society. The center's research is used to further develop Internet potential and to assess Internet-related law. As is underlined on the center's homepage:

We are a research center, premised on the observation that what we seek to learn is not already recorded. Our method is to build out into cyberspace, record data as we go, self-study, and share. Our mode is entrepreneurial nonprofit.

Berkman Center is actually the successor of the Center on Law and Technology, which was founded in 1996 by the Harvard Law School professors Jonathan Zittrain and Charlie Nesson. Based on a donation given in 1997 by the Berkman family, who owned the communications company The Associated Group, the center changed its name to Berkman Center for Internet and Society at Harvard Law School in 1998. Apart from the Berkman family donation, the center receives financial support from foundations, corporations, private donors, international organizations, and government entities. All corporate donors agree to give their funds as unrestricted gifts, for which there is no contractual agreement and no promised products, results, or deliverables. This policy complements the overall policies of Harvard Law School and Harvard University.

The center's overall mission and organization is shaped by its board of directors, which are all faculty members. The Berkman Center community consists of a network of faculty members (full-time staff and faculty associates), around 30 fellows each academic year, more than 100 students each year from a range of schools and disciplines, lawyers, entrepreneurs, and visual architects who all engage with the challenges and opportunities of cyberspace. The center offers classes, workshops,

and conferences. It hosts Internet-related events and visiting lecturers. It offers various Web presences reached by millions of visitors from around the world. All Berkman events, including conferences, talks, and so on are Webcast, and most of them are also available either on Berkman.tv or on Berkman's YouTube channel. It publishes books by faculty members and fellows in the Berkman publication series, academic research papers, policy papers, and blog spots. Furthermore, the center's monthly newsletter on Internet, law, and policy, *The Filter*, has a steadily growing readership of more than 17,000 subscribers; more than 8,000 people receive the weekly *Events and Digital Media Roundup*. Last but not least, the center offers fellowship and summer internship programs.

Berkman Center enjoys a global reputation for cutting-edge research on Internet-related areas. There are three basic areas of inquiry: law, technology, innovation, and knowledge; the relationship between the Internet and civic activity; and technology, law, and development. In the first field of study, the center's researchers try to find ways to balance between the need for innovation in new technologies and the need to secure broad public access to these new technologies. In the second area of inquiry, the center seeks to contribute to the ongoing discussion about the Internet's impact on democracy. Issues like the Internet promoting political participation and democratic dialogue are in the epicenter of various adversary discussions. The third area of inquiry examines the impact of technology in developing countries. Access to the Internet and consequently to more information could probably boost economic growth and enhance educational opportunities.

Projects

The Berkman Center runs a number of prominent and innovative projects. Indicatively, the following are some of the most well known. Within the context of research concerning the relationship between the Internet and civic activity, the center works on the creation of the Internet Monitor. This project is about gathering and evaluating data from multiple sources. It then offers the data freely available online, functioning as an online fact base. This base will provide policy makers, digital activists, students, and many others with

rich and invaluable information. The project attempts to bypass content control and censorship of various facts. In addition, the center is also preoccupied with research on the interaction between different fields of social sciences. The metaLab(at)Harvard is a newly founded experimental research unit that focuses on arts, media, and humanities. One of the lab's major projects has been the extraMUROS. It is an open source HTML5 platform for creating interactive documentaries and new forms of storytelling.

In 2011, the center launched the Youth and Media Lab. This is a youth-driven research-and-development lab that concentrates on the media literacy and digital empowerment of young people. Its aim is to stimulate initiatives around youth and technology. The lab is a meeting point for different strands of research. The lab's activities include exploratory research, curriculum building, development of new tools, and peer teaching. The Internet Law (iLaw) program was also launched in the fall of 2011 and was an intensive, week-long Harvard Law School program and course. The program focused on the development of the cyberlaw curriculum. It involved the revision of important aspects of cyberlaw.

Among the most eminent projects are that of the Digital Public Library of America (DPLA) and StopBadware. DPLA was launched in December 2010. The project aims at designing a large-scale digital public library accessible to all. In order to find effective strategies to achieve this, the center has brought together experts from cultural and educational organizations, librarians, authors, publishers, and state and local government, among others. In 2006, Berkman Center established the nonprofit organization StopBadware, whose aim is to stop spyware, viruses, and other threats on the Internet. StopBadware envisions building a safer Web. Since 2010, it functions as a stand-alone organization.

The programs mentioned here are only some of the many that the center has launched (Media Cloud, H2O, ProjectVRM, Public Radio Exchange, etc.). The Berkman Center for Internet and Society at Harvard University continues research on the development and design of methods and tools to further enhance the knowledge and the use of Internet technologies. During the last years, the center has seen continuous

growth. In May 2008, it was elevated to a major, university-wide, interdisciplinary center also known as Interfaculty Initiative. Since July 2006, the center has been located in the second floor of a renovated, wood-frame house at 23 Everett Street in Cambridge, Massachusetts. The Berkman Center inspired the launch of further research centers, such as the Stanford Center for Internet and Society, the Oxford Internet Institute, the NEXA Center for Internet and Society at the Polytechnic University of Turin, and many others. Berkman Center maintains a fruitful collaboration with the NEXA Center, the Keio University in Japan, and other research centers and educational institutions around the world.

Big Data

MaryAnne Gobble writes that the definition of big data is multifaceted, ambiguous, and dynamic, suggesting the term has different meanings between academic disciplines and practitioners. Put simply, big data sets are too big because of their volume, speed of information or velocity, or because of the variety in the type of data. Big data

sets provide researchers with large amounts of information on many topics, ranging from demographics and psychographics to social networking statistics. These sets are often made usable and archived through data mining techniques.

Thomas H. Davenport, Paul Barth, and Randy Bean identify the many forms of big data, including “clickstream data from the Web, social media content (tweets, blogs, Facebook wall postings, etc.) and video data from retail and other settings.” Big data also refers to any digitally archived information, ranging from recorded content from telephone call centers to biological data from laboratories. Because the term *big data* refers to so many different types of data sets, standardization of meaning and analysis is rare across disciplines.

Big data collected from social media include the recording of user-generated content such as Facebook posting, tweets, user preferences, shared links, and profile information. Big data sets also typically record other less obvious measures, such as time spent lurking, deleted content, and geotracking locations. This information is stored in large servers and databases, and is sometimes only accessible with the owner of the social media’s permission.

Barbara Trish declared 2012 the year of big data in politics based upon the way the U.S. presidential campaigns of Barack Obama and Mitt Romney used large data sets to connect with voters and influence public opinion. The Obama re-election campaign used big data sets derived from Twitter and Facebook to personalize messages, track issue efficacy, and target specific segments of the larger U.S. population. The Romney campaign used big data to identify potential donors and supporters based upon social media information such as purchasing history and religious affiliation.

Controversy

Maurice Vergeer writes that new innovations in data collection and interpretation represent new possibilities in understanding the role of the Internet in politics. However, not all researcher perspectives support such an optimistic view. While the information sciences have made great advances in the interpretation and use of big data, traditional social-political science approaches still favor small-data and theory-driven approaches. Vergeer proposes the real advancement in social

and political research will only occur when the two oppositional approaches work together and support each other's inquiry.

The development and integration of big data in the 2012 election also invoked debate between strategists about the potential future of politics. The collection and documentation of private information makes up the majority of concerns regarding the ethics of big data. If social media data is private, archiving and collecting this information is an invasion of one's privacy and can be deemed unethical. Alternatively, if social media data is public, archiving and collecting such information is ethical.

Alternatively, debate surrounds access and use of big data in politics. Big data sets derived from social media giants such as Facebook or Twitter are costly, meaning that political campaigns with smaller budgets are often unable to purchase the information. What the data sets are used for is also of concern. Joe Turow writes that information gathered from big data sets is beginning to be used by online retailers who adjust prices to meet specific socioeconomic information about individuals. This means that pricing is becoming more individualized and customized to what retailers believe an individual should be charged. Turow also notes that news Web sites are also starting to customize the display of news articles to match what they believe individual viewers will most likely read. Specifically, political campaigns use big data sets to create personalized or targeted advertisements to appeal to users. Just as news media that personalize headlines to reflect what they think will appeal to viewers, language, images, and messages are being customized based upon the information gained by big data sets. Turow suggests this is problematic because possible inconsistencies may develop from such customization.

Critics are also skeptical due to the size and volume of big data sets. Vergeer writes that there is a tradeoff for volume over accuracy that plagues the collection and use of big data. In order to analyze such large data sets, generalizations about social media indicators such as relationship status and political orientation can potentially be misinterpreted. For example, big data sets cannot differentiate when a child is browsing the Internet on his or her mother's computer. Therefore, there

is an acceptance of big data analysts that there is inaccuracy within the information collected.

The future of big data collected from social media for politics is uncertain, although the success of its use in the 2012 U.S. presidential election suggests that it is an important tool in campaigning. As John Timpane reflects, social media and big data sets help politicians find votes and turn potential voters into supporters. Big data is a tool and likely a new frontier in politics and campaigning because of the vastness of the data it can provide.

BlackPlanet.com

Launched in 1999 by Omar Wasow and Benjamin Sun, BlackPlanet.com is a social network site (SNS) that was initially started as an entity to connect its members to potential jobs and

relationships. However, over time BlackPlanet.com has built an online community of roughly 20 million members and become an important forum for other social and political issues of importance to the African American community. Historically, black social networks in the form of fraternities, sororities, and other organizations have been an important source of empowerment for African Americans. Prior to BlackPlanet.com's emergence, other social network sites were launched to focus on marketing to the African American community, such as The Drum (1988), Melanet (1989), and NetNoir (1995), and they, along with others, represent a generation of black online entities that catered to specific audiences prior to and after the Internet became commercially viable. In regard to BlackPlanet.com, it was and is a pioneer in minority social media ownership, civic engagement, and social media ethics.

Minority Ownership

Historically, in the area of traditional media, minority ownership and employment has faced challenges and, in recent times, have even declined. Previously, during the civil rights movement and social disturbances that followed, the Kerner Commission successfully argued for greater minority participation in ownership and employment opportunities. Yet, by the 1990s and the passage of the Telecommunications Act of 1996, the ownership of minority media began to decline due to consolidation of broadcast media and the under-collateralization of minority-owned outlets that struggled during economic downturns. However, the advent of new media technology provided opportunities in entrepreneurship and innovation.

BlackPlanet.com and other minority SNSs emerged in the 1990s as entrepreneurial opportunities in response to what some scholars referred to as the digital divide. For example, recent studies indicate that African Americans more than any other ethnic group receive most of their news from the Internet and also represent, as recently as 2010, a disproportionate number of users on the SNS Twitter. Therefore, the launch of BlackPlanet.com by Omar Wasow and Benjamin Sun, the chief executive officer of Community Connects Inc., remains a historical example of where economic success merged with social advocacy. Although Community Connect, the majority stakeholder,

was not African American owned, it was a culturally sensitive operation that operated a controlling interest in other minority SNSs, such as AsianAvenue.com, the English-language Latino entity MiGente.com, and the gay site GLEE.com. Yet, BlackPlanet.com, along with MiGente.com and AsianAvenue.com, were seen as so profitable by 2008 that they were purchased by Radio One, an African American media company, for the sum of \$38 million.

Civic Engagement

Prior to the launch of Myspace and Facebook, BlackPlanet.com was active in regard to civic engagement in the African American community. For example, BlackPlanet.com currently engages in raising money for programs involved in public education, has raised funds for projects related to earthquake or tsunami relief, and also promotes a Riser of the Month reward, which recognizes members that are social or community advocates. However, one of the more memorable accounts of civic engagement on the site was when then-presidential candidate Barack Obama became a member of BlackPlanet.com and was able to gain close to 200,000 friends within 10 days.

Many of the members of BlackPlanet.com were also members of Myspace or Facebook, and these socially connected networking sites helped Barack Obama organize a constituency under the auspices of the Obama campaign, which transcended national borders. For example, the Obama campaign's use of online SNSs such as My.BarackObama.com, Facebook, and others allowed the viral explosion of an unsolicited Web video called "Yes We Can," by will.i.am (William James Adams), a member of the music group Black Eyed Peas. What started as a campaign from the North American region for Obama was also exhibited in the Caribbean community with overwhelming presence in polling data and musical creations reflecting this support in Jamaica and Trinidad and the other locales in the region.

The Obama campaign represented an important turning point, geographically speaking, among peoples of African descent in Western society in relation to the nexus between civic engagement and the cybersphere. Thus, SNSs like BlackPlanet.com and others have utilized the digital processes available today that have collapsed

Will.i.am's "Yes We Can" video plays via YouTube projected onto a screen above a crowd during an Obama campaign event led by Michelle Obama on February 3, 2008, at San Jose State University.

time and space on a national and global scale to such a state where change is globally synchronous or occurring at the same time in several spheres and locations, influencing history and shrinking geographical distances that previously prohibited civic engagement.

Social Media Ethics

Interestingly enough, BlackPlanet.com has become an example of how the identities chosen by online users of SNSs exemplify the relationship between technology and avatars (virtual representations) and the tension between a previously unitary identity and a virtual identity that operates under a different set of laws and hierarchies. For example, previously constructed social identities were in response to earlier conventions of norms and stereotypes, whereas the Internet allows for a collaborative approach to identity that does not necessarily conform to previous cultural logics or explanations or that conform to common

awareness. Second, this approach of SNSs to virtual identity construction allows users to choose their identities, although this fact or practice can still influence users to take into account the dominant social norms of racial or gendered labels. Finally, with regard to social media ethics, BlackPlanet.com will likely be among the SNSs that will respond to the rapid change of technological innovation in relation to their various constituencies who are engaged in networking, community service, and economic advancement in their respective locations.

Blog for America

Blog for America was from March 2003 to March 2004 the official title of the campaign Weblog of Howard Dean, at the time a candidate in the U.S. Democratic Party presidential primaries. It was arguably the most important campaign blog in the 2004 elections, and it constituted the engine behind the improbable run for the U.S. presidency of the former governor of Vermont, a then

relatively unknown figure on the national political stage. Heralded as a revolutionary campaign tool capable of fostering community action, Blog for America failed, however, to gather sufficient voter support for Howard Dean, who exited the presidential race after unsuccessful bids in the Iowa and New Hampshire primaries. Scholarly assessment of Blog for America has ranged from regarding it as a vehicle for enhanced civic involvement with potential to counteract the negative effects of television on the political process to viewing it as a form of discourse inviting antagonism and thus risking to polarize society and to weaken democratic culture.

Blog for America was launched by the Dean campaign on March 15, 2003, with a post by campaign manager Joe Trippi, who explained that it was intended as a place for the campaign to let people know when, where, and how they could help, thus to get as much support as possible from the grassroots. The frequency of blog postings by campaign staffers Matthew Gross, Zephyr Teachout, Clay Johnson, and Nicco Mele increased from 17 during March 2003 to 140 during May 2003 and further to 300–400 each month between June 2003 and February 2004. The blog became increasingly successful as people began checking the information placed there, and Dean started to establish himself as an outspoken anti-establishment candidate. However, the blog surged in popularity after June 10, 2003, when Blog for America introduced the “moveable type” software that allowed viewers to write comments in response to the campaign posts. Soon thereafter, comments grew from several a day to thousands a day, and the blog reader community grew from thousands to hundreds of thousands. Blog for America became not only a campaign information hub but also a policy discussion portal, with added capacity for being a recruitment, consultation, mobilization, and fund-raising instrument for the Dean campaign.

Impact

It is thus unsurprising that in late 2003 and early 2004 the mainstream media paid much attention to the Blog for America phenomenon. At the peak of Dean’s fame, journalists from the *Boston Globe*, the *Washington Post*, the *New York Times*, and the *Pittsburgh Post-Gazette* agreed that Blog

for America had enabled Dean supporters to take an active role in the campaign and to be involved in the decision making of the campaign, thus feeling motivated, believing they were making a difference, gaining a sense of community previously possible only for local elections, and forever transforming political campaigns. Campaign bloggers were cited in these articles calling Blog for America a new form of open source campaigning, because of its conversational tone and its interactive possibilities, and also calling blogs the new town hall meetings, because of their potential for debate and participation. However, the limits of the blog’s effectiveness were seen in the Iowa and New Hampshire primaries, in which the online energy was not translated into voter turnout. After a disappointing third place in the Iowa primary and a catastrophic second place in the New Hampshire primary (at least partially attributable to his scream during the Iowa concession speech), Dean ended his candidacy for the U.S. presidency.

Analysis

Researchers examining various aspects of Blog for America have been far from reaching consensus regarding the blog’s format, functions, meanings, or impact. In 2005, researchers Matthew Kerbel and Joel Bloom mirrored 2003 journalists’ conception that Blog for America had been an authentic virtual community and not just a mere conveyor of information. These scholars added that the blog had become an alternative to mass media through its focus on partisanship and advocacy. They saw it in the tradition of the 19th-century press, which boosted voter mobilization and helped support many worthy civic causes, instead of a focus on objectivity and balance, which came much later and were an imperfect response to the necessities of mass marketing.

However, in 2006, Jennifer Stormer-Galley and Andrea Baker disagreed that Blog for America constituted a truly interactive forum. After describing how the red bat, which went on to become a powerful symbol of the Dean campaign (representing Dean’s projected success in the race and the campaign’s success in fund-raising activities), was first suggested on the blog but finally adopted for a campaign event only after a supporter made a phone call to campaign staffers to ask whether they were listening to online suggestions, these

scholars asked whether citizens and staff were talking “with” one another or “at” one another. They contended that the Dean campaign primarily used the blog to facilitate parasocial interaction, an illusion of face-to-face relationship, in this case employed for scoring political points, rather than using the blog to assist in mobilization for action, which would have been truly transformational.

James Janack stated that while the Dean campaign may have been willing to relinquish some control over its message, thus opening up the possibility for dialogue, the participants on the blog (many of whom were ardent Dean supporters) exercised that control themselves by tagging opponents to Dean as “trolls” and disciplining such opponents by means of either ignoring or excluding them.

Benjamin Warner goes even further with denying the merits of Blog for America by asserting that this blog and other blogs such as those of the Obama campaign in 2008 used rhetorical techniques, enhanced with aid from high-tech features, of leading participants into dangerous antagonism in which the legitimacy of political opposition was brought into question and adversaries were treated with enmity. According to this argument, in taking this approach political candidate blogs go against ethical media practices and pose a threat to democracy, rather than engaging citizens and enriching democratic processes.

Whether considered a success or a failure, whether regarded as a positive or a negative development, Blog for America remains a significant development regarding the relation between social media and politics, and will continue to have an influence on political campaigns of the future.

Blog Storm

Blogs are a relatively new social phenomenon that first emerged in the late 20th century. However, in the last several years, blogs have become a powerful sociocultural force. Originally developed as a system of online communication between a few enthusiasts in the mid-1990s, the blogosphere has emerged as an important mainstream artifact in relation to the digital sphere in the genres of personal diary, journalism, community forums, and entertainment. In recent years, research on social

media is addressing the influence of different types of blogs in relation to Internet practices and computer-mediated communication (CMC). One such blog phenomenon is that of the blog storm. Marvin Ammori notes that blog storms are sociopolitical ad hoc campaigns organized by groups or collectives that are private and exist due to the existence of inexpensive technology; and these groups dissipate following the conclusion of the campaign. Also, blog storms have become a common feature in the blogosphere in relation to politics, social movements, and corporate promotions. More important, there is a need to be cognizant of this particular subgenre of blogs, related technology, and theoretical perspective of a blog storm.

Blog

A blog is an online Web site that is dedicated to posts by the author or authors. Often, posts will contain related information from various forms of media, such as newspaper articles, diary entries, television, radio, and/or personal observations. Furthermore, they have the ability to embed links, photos, video, and other forms of media. Collectively, the blogosphere, as it refers to itself, does have self-referential qualities, and ongoing digital conversations are encouraged among blog authors and consumers with capacity for feedback and opportunity for posting comments, with software to account for the traffic a page can generate. There are many different types of blogs, public or private, dedicated to a multitude of topics and ideas. However, what makes the blog storm unique is its capacity and flexibility to cheaply organize highly effective social media campaigns that have the ability to influence consumers or voters.

Technology and Blog Storms

Two important technological components in relation to blog storming are Really Simple Syndication (RSS) and Atom; both are XML-based programs that increase the blog storm's ability to market, grow, and gain consumers across social media networks. The utilization of syndication technology aggregates helps the individual blogs to update new content swiftly and efficiently. Syndication technology is a push program that directs content to social media users interested in the topic on the basis of subscription, as opposed

to the more traditional model of search-and-visit traffic. Syndication technology allows social media consumers the ability to customize their own tastes and news feeds, although a drawback is relying on sources to an extent that the information becomes a mere echo chamber for the consumers and can skew their perspectives. However, this feature has been common since the 1990s and has been a part of mainstream social media technology since the early 2000s.

Theory and Blog Storms

The 2004 presidential campaign was one of the primary forces driving the explosion of blogs and blog storms. Bloggers were allowed access to conventions and issued press credentials among other forms of recognition traditionally allowed to mainstream journalists. However, a theoretical consideration or explanation for the emergence of blog storms is in the area of Trevor J. Pinch and Wiebe E. Bijker's social construction of technology theory (SCOT) and sociological structuration theory (SST), as discussed by Anthony Giddens. SCOT is the appropriation of blog technology for an individual or a group's communicative goal, and SST explains the duality of structure and agency and the relationship between micro- and macroparadigms.

Two examples of these theories working in tandem with relation to blog storming in the 2004 U.S. presidential campaign were the Howard Dean and John Kerry campaigns. The Dean campaign was the first major presidential campaign to derive its fund-raising energy through a grassroots digital blog storm approach that represented an exciting alternative to the conservative media establishment. Conversely, in relation to the Kerry campaign, a conservative blog storm campaign organized around the title *Swift Boat Veterans for Truth* and helped to blunt the initiatives of the Democratic nominee's campaign. However, since the 2004 U.S. presidential campaign, the utilization of blog storms by ad hoc groups and other organizations has evolved in ever more sophisticated ways, particularly in corporate promotions of consumer products and entertainment.

Blog Syndication

Blog syndication is a process by which the content of a blog Web site is disseminated, in full or in part, via republication on other Web sites or digital media readers. Original blog material is distributed to secondary sites via various Web feed programs. Blog syndication adheres to the same general principles by which newspaper columns and television programs are syndicated to diverse local and national media outlets.

Web syndication technology began with Apple Computer's Meta Content Framework in 1995. Studio One Networks designed the first syndicated programs intended for large-scale content distribution for American Honda in 1999. Since that time, millions of online publishers have disseminated Web site content through standard format news feeds. Political blogs quickly adopted this social media technology and now routinely share links and blog content via a diverse number of Web feed syndications.

Blog syndication is one of the principal means by which a blogger may increase Web traffic, expand viewership, and network with other Web sites. A blog site creates original material and subsequently distributes such content through Web

feeds to various subscribers or secondary Web sites. While the content of most blog syndication is text based, bloggers also utilize video formats, podcasts (utilizing the success of developments such as Apple's iTunes platform), and other innovations in social media technology. Blog syndication amplifies previous modes of content distribution, including e-mail lists and self-promotion via social network sites such as Facebook.

Most blogs allow users to subscribe to a Web or syndication feed that distributes syndicated material, such as blog posts, directly to users via various digital media options, known as feed or news readers. Multiple Web feeds may be aggregated on a single reader, or aggregator, which allows users to customize their news content. Content syndication modes include Really Simple Syndication (RSS) or Atom feeds and full-content feeds. RSS feeds display headlines and, occasionally, summaries of the original post on the user's feed reader. Full-content feeds provide content as it appeared on the original site.

Alternatively, blogs may syndicate original materials to secondary, aggregator Web sites. The original post thereby reaches a wider audience, and the original Web site or blogger enjoys the prestige of content syndication on one or more aggregator Web sites. The receiving Web sites generate greater traffic and interest by aggregating noteworthy and immediate material from notable writers and sites. Blogs may permit limited use of their original Web content to specified syndication partners or may allow unrestricted syndication to any interested aggregator Web site.

The vast majority of bloggers receive no compensation through the syndication of their content, though broadened exposure and increased traffic may generate income by way of paid advertising on the blog site. Bloggers may also receive a portion of the revenue generated by paid advertisements on a receiving site, usually based upon the Web traffic attributable to their syndicated posts. Finally, bloggers may be awarded royalties based upon end-user access via licensed syndicators, though licensed blog syndication is most often limited to private, closed systems, such as university libraries, rather than publicly available aggregator sites.

Content syndication is widely employed by aggregator sites as a strategic method of link

building with regard to search engine optimization. The content of syndicated material includes embedded links that direct search engine algorithms to the Web sites to which the content is linked. As such, an aggregating Web site and, to a lesser degree, the original Web site may significantly increase their respective rankings in relevant search engine results through the dissemination and aggregation of content with related anchor terms.

Of course, as aggregator sites collect more content-related material, search engine results will inevitably link to the aggregator site before, or instead of, the original Web site on which the content first appeared. This substitution and elevation of an aggregator site over the original blog site is often cited as an unfortunate consequence of the blog syndication method, but the benefits of wider recognition and exposure have motivated the rapid expansion of the blog syndication model.

With the prolific multiplication of politically oriented blogs and, subsequently, aggregator sites, the blogosphere has been effectively saturated with political news and commentary. Blog syndication may be regarded as attempting to remedy this problem by selectively identifying the most popular and useful materials from diverse Web sites and reproducing such content on a single Web site. However, blog syndication also aggravates the problem by creating even more political Web sites and multiplying online content through the reproduction of previously published materials.

Blogger Rights and Responsibilities

Blogger rights and responsibilities are outlined in Section 230 of Title 47 of the U.S. Code as well as case law shaping its interpretation. Part of the 1996 Communication Decency Act, the legislation called Section 230 was titled “Protection for private blocking and screening of offensive material.” For the estimated 31 million U.S. bloggers as of mid-2012 (according to BlogWorld.com), this has become a safe haven with protection from legal action against others’ comments made on a blog, keeping bloggers from being labeled as publishers. Some believe Section 230 gives bloggers more rights than Congress originally intended and shows how Internet publishers are treated differently than publishers in print, TV, and radio.

Content of Section 230

Initially viewed as a necessary step to ensure access to Internet content while also offering protection to Internet service providers (ISPs), Section 230 offered protection against lawsuits for hosting potentially illegal content on Web sites, servers, and more. Since 1997, Section 230 was expanded to include lawsuit protection from Web sites hosting forums, wikis, blogs, ratings Web sites, and others.

The actual text of the section, only about 850 words, sets policy protections for “Good Samaritan” blocking, and outlines definitions of information content providers and access software providers. In its findings, the section states that the Internet and interactive computer services, like those provided by blogs, “offer a forum for a true diversity of political discourse” and “Americans are relying on interactive media for a variety of political, educational, cultural, and entertainment services.” The policy statement has messages about promoting the continued development of interactive services, the value of the competitive free market, user control over the information he or she receives, and enforcement of criminal laws of obscenity, stalking, and harassment.

The Good Samaritan passage says that “no provider or user of an interactive computer service shall be treated as the publisher or speaker of any information provided by another information

content provider.” The second part of this item says no provider is liable for a good faith effort to restrict access to obscene or lewd material even if material is constitutionally protected. A provider is not liable for providing means for users to restrict such materials.

Under the section, interactive computer services must notify users of parental control protections available. Section 230 has no effect on criminal law, intellectual property law, and the Electronic Communications Privacy Act of 1986, and should not prevent state law enforcement.

Definition of Terms

Definitions provided in Section 230 affect bloggers. Interactive computer service refers to “any information service, system, or access software provider that provides or enables computer access by multiple users to a computer server, including specifically a service or system that provides access to the Internet. . .” This includes blogs, forums, and listservs. Information content provider means “any person or entity that is responsible, in whole or in part, for the creation or development of information provided through the Internet or any other interactive computer service.” An access software provider simply provides the software and tools to filter, allow/disallow content, digest content, transmit, organize, or translate. A complete list of tools is included in Section 230.

Individuals Who Post Content

The ISO or Web site owner is not liable for the third-party content on his or her Web sites, but the individual who posted the content is liable for the information contributed to the Web site. These individuals can be sued for the content they contributed, whether they posted the information under their actual name (or username) or if they posted the information anonymously, according to George Pike’s article in *Information Today*. Unfortunately, some ISOs are not willing to reveal the identity of anonymous posters. Their unwillingness to contribute this information might be due to potentially negative implications arising from their Web site membership. Some lawyers in anonymous poster cases have resorted to “John Doe” lawsuits (similar to anonymous music download lawsuits). Even if the individual who posted the content is

identified, the likelihood of obtaining financial damages from an individual who does not have funds (judgment proof) is not promising.

Editing Content

For a blogger to exercise traditional editorial functions, like deciding which guest blogs to publish, or which comments to delete or trim, is typically immunized under Section 230. The protected functions would be those an editor would typically perform on user-submitted content. The Digital Media Law Project from the Berkman Center for Internet and Society offers guidelines to bloggers for acceptable editorial functions that would be covered by Section 230 protections: screening objectionable content, removing/editing/correcting content, selecting content for publication, paying a freelance writer for content (if the payee is an employee of the blog, Section 230 may not cover the situation—state agency laws apply), providing neutral forms or drop-down menus for content submission, or leaving defamatory third-party content on the site after being notified of its nature. Some limitations in the immunity could come when editing in the following manner: materially altering the third-party content’s meaning, using drop-down menus or forms to create discriminatory content, or not upholding a promise to remove certain material (which could become a promissory estoppel issue).

Case Law

Section 230 has been tested in the courts, and between 1996 and 2009, 184 cases used the section, according to David Ardia. The majority of the cases are those with defamation-based claims, but cases also include invasion of privacy, misappropriation, and negligence. In *DiMeo v. Max*, the court found the defendant not liable for comments left by third parties on a blog. An often-cited case is *Fair Housing Council of San Fernando Valley v. Roommates.com, LLC*. In the case, a fair housing organization sued Roommates.com for violations of the Fair Housing Act. A three-judge panel found that Roommates.com was not protected by Section 230 of the Communications Decency Act because it asked questions of participants that were then used to craft member profiles. It was protected in the “additional comments” portion of its site because particular information was not

sought. The questions or prompts were a distinguishing point for the judges, and later the Ninth Circuit. Content that users provide is protected by Section 230, but case law is carving out distinctions like whether or not how the site categorizes and channels information to others is immune. For example, *Carafano v. Metrosplash.com, Inc.* contradicted the *Roommates.com* case saying the site operator receives full immunity regardless of the selection process, or editing.

Bloggers and Politics

Bloggers are both users and providers of interactive computer services. By posting content, they are users, and by offering mechanisms for commenting, they are interactive computer services. Bloggers do not have to post user guidelines or standards for what is acceptable on their blog, but it is generally recommended that they do so. When editing or curating posts, the blogger can make good faith edits. A New York court ruled in favor of a blogger who took an inflammatory comment by another and moved it to center stage as a blog post with a picture and headline. The decision was split, with the dissenters making a case for the amount of edits and treatment the post received.

Developments in 2006 brought concern for bloggers with the Federal Election Commission's eye on online communication and political advertising. The Electronic Frontier Foundation reported the final decision was that bloggers could still promote a candidate, or criticize one without compensation, without new restraints. Bloggers paid to promote a candidate, in a nonadvertisement form, could do so and were not required to disclose the payment.

Examples of Political Blogs

Political blogs might be run by a candidate, a campaign, a political action committee, a political party, or nonaligned groups (faith-based, gender-specific, or socioeconomic groups). A growing number of blogs focus on politics from the local, regional, and state levels. Some of these individual and organizational blogs include Daily Kos, Michelle Malkin's blog, and Daily Dish. Other blogs are created and maintained by certain political parties; examples include Democrats.org and GOP.com.

Daily Kos, Michelle Malkin, and Daily Dish have been studied in academic journals because of their reach and impact. Daily Kos is a blog from the liberal side of the political spectrum. Founded in 2002, it boasts 2.5 million unique visitors per month and claims to be a news organization, community, and activist hub all in one. It provides a wiki with frequently asked questions that helps set the tone and standards for the blog. One such standard is how the blog handles the "outing" of an anonymous viewer—it is a bannable offense. In response to backlash on a Chevron ad on the Daily Kos blog, founder Markos Moulitsas Zúniga created an advertising policy and concluded that running an advertisement does not imply endorsement. The site also has rules for participation in creating diaries and comments in threaded discussions, as well as handling trolls.

Michelle Malkin's blog represents conservatives. She is a syndicated columnist, author, and Fox News Channel contributor. She uses a disclosure statement and terms-of-use page to cover the basics of who can comment and how comments will be handled. As she states, "I welcome your participation, but if you abuse my hospitality, don't be surprised if you are shown the door." She asks that participants register, and be at least 18 years old. Andrew Sullivan's independent Daily Dish was formed in 2000, and purports to be one of the first political blogs. Its site statistics report an average of more than 113,000 visits a day. Sullivan's site contains a privacy policy, with a special note about Children's Online Privacy Protection Act (COPPA) compliance.

RedState.com provides an exhaustive list of posting policies, with blog-specific terms like "sockpuppeting," using multiple accounts to post and thereby providing deceptive extra support for one's own position. The site even lists theories that will not be accepted by users—like a call for the overthrow of the U.S. government. In contrast, two political party blogs, Democrats.org and GOP.com, simply post terms and conditions along with a privacy policy. In local-level politics, a Cincinnati set of bloggers at CincyVoices actually references Section 230 on their blog, stating that guest bloggers, readers' comments, tips via e-mail, and Rich Site Summary (RSS) feeds or other sources are considered another content provider.

Senator Strom Thurmond with Army Chief of Staff Eric Shinseki at his 100th birthday celebration on December 4, 2002. Bloggers drew attention to Trent Lott's comments at the event, in an early example of the power of political bloggers.

Implications of Political Blogs

Without the restrictions of a traditional news outlet, bloggers are offering firsthand information to the public as an alternative source of news. Even in 2002, political bloggers were exerting their power. When the mainstream media passed over the story of the racist comment made by Trent Lott at the 100th birthday party for Strom Thurmond, bloggers reported, and kept reporting, until they got the legacy media's attention. Political bloggers are important actors in the agenda-setting process, according to Kevin Wallsten's 2007 research. Mitzi Lewis found a strong relationship between blog reading and online political discussion and participation during the 2008 U.S. presidential campaign. She concludes that the potential effects of blog reading could impact the political landscape of the world.

In political discourse, Section 230 aims to open the marketplace of ideas for an exchange of varying opinions. The aim is a blogosphere with information about candidates, platforms,

and forums for questions, debate, and discussion. Section 230 gives bloggers room to be an open forum for discussion, but with great freedom comes great responsibility. Journalists acting as bloggers can lean on the Society of Professional Journalists' code of ethics for guidance, but bloggers are largely operating outside of traditional journalism.

Political bloggers can self-regulate standards of responsibilities like quickly correcting inaccuracies, properly citing sources, adhering to copyright laws, and disclosing conflicts of interest or paid endorsements. For their own content, becoming an information content provider, they must realize their words will not be immune under Section 230.

David Ardia writes:

If Congress considers modifying section 230, it should keep in mind that the rich informational ecosystem we know today is not simply a product of the decentralized, open architecture of the Internet. It is a function of the "breathing space" Internet intermediaries currently have under the law to facilitate speech that may be injurious or illegal.

Blogosphere

The *blogosphere* is a coined term describing both the network of aggregate blogs in cyberspace and the online community created by their interconnection. Through its dynamic linking of people, political parties, organizations, content, and concepts, the blogosphere has become a much-studied space, both representing and arguably facilitating an era of open source politics. Vigorous debate continues between utopian and dystopian views over the blogosphere's potential and actual impact on politics.

In considering the blogosphere's impact on the political domain, many theorists eschew the popular technodeterminist position that the movement arises from and is determined by the technology itself, stating that the growing phenomenon of blogging emerges from currents in culture over generations.

Aaron Barlow argues that rise of the blogosphere has been a slow march then sudden explosion that stemmed from increasing discontent with the noninclusivity of politics and media and an era of depressed civic engagement. The emphasis on the role of the press as an observer of society

led to the disenfranchisement of people from direct participation in the spheres of media and politics, limiting their means and outlets of free expression. The traditional media incorporated public opinion through the use of experts, held as representative of the people, although they enter the political domain to further their own agenda, meaning that the true voice of the people was curtailed from the public sphere.

The pluralization of sources of information and opinion through the blogosphere has enabled the true democratization of knowledge, Megan Boler states, although it coexists simultaneously with the blatant falsification of information by government and corporate powers. Whether and how blogs then mobilize civic engagement and affect the media and political landscape becomes a key question.

While many theorists celebrate the political influence of the blogosphere, others disagree on its ability to transform politics and increase civic engagement. Some argue that, while a triumphalist narrative has been written of the blogosphere, most blogs in fact have little political influence, stating that the collective fact-checking of Dan Rather's erroneous coverage of a key news story in the 2004 U.S. presidential race (known as Memogate) serves as one of the few exceptions to the norm of blog flops.

Theorists also argue whether links between blogs—or the lack of—are evidence of isolation or of interconnection among bloggers. Bloggers commonly link solely to their own self-selected community of those sharing their political views, evidencing partisanship and curtailing the potential for expanded interaction and political thought. Theorists comment that political bloggers express emancipation as well as cynicism; however, Antoinette Pole and Matthew Kerbel argue that real political influence and civic engagement is achieved through the blogosphere.

In maps of the blogosphere (visualized through the mapping of the static or dynamic hyperlinks that connect blogs), clusters reveal distinct subgroups and niche interests (such as topics of law, military, and security dominating political communities). Political discourse is the most densely linked network neighborhood, above other niche topics such as fashion and sports. The influence of A-list bloggers also can be identified by their

core positions at the center of the network, and a distinct right and left split in the blogosphere is apparent, clearly evidencing the liberal and conservative networks of politics.

Matthew Kerbel states that the loosely affiliated community of bloggers collectively calling themselves the progressive netroots has the greatest potential to build political advantage through the decentralized nature of the blogosphere and their ability to engage real and virtual communities of activists. Others, however, argue that the expansion of channels of the social Web and speed of change in this constantly adapting digital landscape mean mapping and predicting the future of the blogosphere is largely futile.

In examining the political clout of blog networks, issues of how readers assess credibility and independence become paramount. Theorists examine how the blogosphere competes with traditional media as an informed source of public knowledge and belief and assess whether old-style journalism is now threatened by the blogosphere, about to become obsolete or to be replaced by a new business model.

Aside from ranking the top topics on the blogosphere (which include the Arab Spring), studies have shown that journalistic institutions are still the central and dominant influencers of the media ecosystem, with a majority of blogs linked not to other blogs (such as those by independent bloggers) but to traditional or legacy media. Numerous successful bloggers and sites (such as the *Huffington Post*, ranked the top political blog site) have been acquired by the traditional media.

Blogs have emerged as prime real estate for advertisements, causing the blogosphere to be challenged and influenced by commodification and commercialization and proving it to be ironically similar to the legacy media it has allegedly revolutionized. While bloggers have claimed the role of watchdog over both political and media powers, the distinction between the traditional media and the blogosphere is now blurred.

The rising numbers of hate blogs and Arab Spring blogs have also fueled debates about censorship, surveillance, and freedom of expression. Although the blogosphere emerged from efforts to circumvent the gatekeepers of the past, new gates and gatekeepers have also emerged (such as China's Great Firewall), which limit both content

and access to the blogosphere itself and in turn impact the blogosphere when blogs are moved to escape their control.

While some theorists may argue that the blogosphere arose from rebellion against the controls of political forces and the traditional media, researchers now examine whether the control of the blogosphere is shifting from—or to—the domain of media empires and governments and its effect on the both the realm of the Internet and of politics.

Blogs

Blogs (short for Weblogs, personal logs on the World Wide Web) are online personal diaries, edited in reverse chronological order, usually authored by a single individual. They have strongly contributed to enhancing media pluralism and cultural diversity worldwide. Bloggers deprived of liberty or life for their online communications, supported by human rights organizations, are considered defenders of free speech in the modern information society, a role once played solely by print and radio or television journalists. Although international law provides

for numerous guidelines on the contents and limits of the right to free expression, their practical application to media publishing is traditionally set within acts of national law. Therefore, setting the limits of free speech for online publications, including blogs, is one of the biggest challenges to contemporary human rights law. Weblogs also provoke important questions on the scope and scale of intermediary liability and project shifts in the economic model of the global media market, adding to the change in the professional situation of journalists and the advertising market. Blogs hold an increasing commercial value with the introduction of commercial blogs, or splogs, as new methods for online advertising.

Blogs Versus Traditional Media

Although blogs are sometimes referred to as journals or media outlets, their legal status remains unclear as numerous significant differences between blogs and traditional media may be depicted. The crucial difference lies in the organization of traditional media outlets when compared with blogs. The former are run by editorial boards, editors-in-chief, and publishers who all aim to provide high-quality publications significantly more professional than amateur, nonmedia publications. Traditionally, media law distributes responsibility for published content among different actors: authors, editors, and publishers. This feature usually may not be identified with blogs, where an individual usually embodies all the editorial functions, and no severability of rights and obligations may be identified. Therefore, uniformly granting all bloggers status equal to media journalists is questionable. Simultaneously qualifying blogs as media would subject their editors to any and all national and international media law regulations. A positive assertion of blogs as media would result in laying particular professional due diligence obligations and respectively higher-quality and professional standards upon their authors, ones usually required from professional journalists by law.

While it is clear that not all blogs and bloggers aspire to be professional bloggers, there exist no criteria for telling apart bloggers who wish to perform as journalists and those who do not. Packard notes that the increased popularity of social media and microblogs, such as Twitter, blurs the

distinction between a professional journalist and a blogger even more.

Blogs have strongly added to the promotion of free expression by media professionals and private individuals alike. Unlike traditional press, however, blogs offer little background information on the status of their authors and publishers. Blogs often lack information on the legal status of the entities responsible for blog content or the locations of their publishers, which in turn brings doubt on their objectivity, trustworthiness, source protection, reliance on a uniform system of ethical principles, and assignment of civil liability, in particular as some bloggers may attempt to give false personal data to avoid liability for unjust criticism.

The European Parliament Culture Committee in 2007 expressed worry that bloggers may considerably pollute cyberspace with spam, misinformation, and malicious content. In order to avoid that risk, more transparency in the blogosphere was called for. The committee proposed a voluntary system of labeling blogs according to their authors' preferred status. Bloggers who wished to perform the journalistic profession online would be requested to place a suitable disclaimer on their blogs, which would result in them obtaining the rights and obligations of a professional journalist, including, for example, the right to protect journalistic sources from judicial enquiry or the obligation to show professional diligence in preparing online publications. The proposal met with much criticism as an attempted attack upon free speech online and was never adopted. Currently, no distinction between media and blogs can be made.

Legal Status

The confusion on the legal status of blogs brings numerous questions on the allowed and justifiable limits of free speech for blogs and bloggers permitted by national laws and international human rights law. Due to the transboundary character of blogs' natural environment that is the cyberspace, the issue of media freedom, thus far left to national regulations, became the subject of an international debate. Although international law provides for numerous guidelines on the contents and limits of the right to free expression, its practical application to media publishing is traditionally set in acts of national laws.

The 1947 Universal Declaration on Human Rights (UDHR) in its Article 19 provides for the basic framework of free speech as a human right. Repeated in numerous international law treaties, the internationally recognized human right to free speech allows each individual to concurrently distribute, receive, and share information. Any limitation to any of those three complementary rights must be foreseen in an act of law and applied only in exceptional, individual instances. Grounds for limiting the individual right to free speech broadly set in Article 29 UDHR include securing due recognition and respect for the rights and freedoms of others as well as meeting the just requirements of morality, public order, and the general welfare in a democratic society. Although the international community has been working for more than 60 years on defining the universally recognized particulars of those terms, no practical and universally applicable consensus may be found. National laws on defamation or lese majesty strongly differ, although all are based on the consensus expressed in Article 19 UDHR.

This disaccord on the human rights standard of free speech proves particularly difficult when faced with the transboundary characteristic of blogs. State jurisdiction, that is state competence to exercise its laws, may be recalled on the basis of availability of illegal content within state territory as the so-called effective jurisdiction. Bloggers residing abroad may therefore be considered liable or criminally responsible for their online publications in foreign states, and those states may exercise their laws over foreign defendants, as confirmed by the 2011 case of Joe Gordon, an American citizen sentenced to prison without parole in Thailand for defaming the Thai king on his blog, operated from his U.S. home. Gordon was apprehended and charged upon his arrival to Thailand for a holiday.

This lack of legal certainty among bloggers has provoked them to identify international, community-based ethical values, set within numerous blogging codes of ethics, all sharing a similar set of basic principles. While relying on the notoriously recognized principles of netiquette, blogging codes of ethics usually include the obligation to provide transparency of sources and resources, accountability for the information published, as well as commitment toward the

freedom of expression and factual truth. Compliance with general copyright rules, such as a prohibition of plagiarism and obligatory quotations of sources, as well as an obligation to minimize possible harm caused by a publication are also often named. Deriving from the developments in journalism ethics, blogging ethics call for the accuracy of interpretation, without any misinterpretations of the facts, including disclosure of any possible photo editing or text clipping. Bloggers aim to seek the truth, claim editorial independence, and hold accountability and transparency vis-à-vis their readers. The development of journalism ethics proved it impossible to adopt a single, universally applicable set of detailed ethical rules. Ethics of difference, or ecumenical ethics, reflect this inefficiency by allowing journalists to act differently in particular situations when respecting the same principles. Such flexibility is necessary to allow different styles of journalism and the meeting of different agendas set for different media. It therefore also finds its way into social media, including blogging.

Rights and Responsibilities

Blogs raise uncertainty when it comes to individual responsibility for online content. Identifying an author of a blog post might be practically impossible and, unlike with traditional media, such as printed press, radio, or television, an editor-in-chief or an editorial board are rarely named within a blogging Web site. Anonymous blogs or blog posts, therefore, evoke the question of the right to anonymous speech online. The right to anonymous speech does not originate directly from Article 19 UDHR and may not be recognized as an imminent element of the right to free speech in the light of the contemporary international human rights doctrine and jurisprudence. There is no universal consensus that such a right is enforceable, and a clear line may be drawn between the U.S. acknowledgment of such a right and the European or Asian reluctance to recognize it within national systems of law. Therefore, no universal right to anonymity for bloggers may be identified, making the question of online content liability and responsibility a pressing issue. Anonymity of the authors of press publications provided for in some acts of national laws is always safeguarded with the subsidiary liability

of the editor-in-chief or the publisher, who both hold authority to decide upon the actual publication of anonymous information and hold responsibility for the overall content of the media they manage. Regarding the nature of blogs, where the author usually embodies all editorial functions, no similar mechanism may be identified.

The scheme for online content regulation recognized in most democratic countries is the so-called notice-and-takedown procedure. Originating from the 1998 U.S. Digital Millennium Copyright Act and reflected in the 2000 European Union (EU) Electronic Commerce Directive, the notice-and-takedown procedure sets Internet service providers free from the responsibility or liability for content they render access to as long as they have no knowledge of the infringing character of such content. Upon receiving a proper notification of its infringing character, service providers are obliged to temporarily or permanently disable access to such content. The access is disabled temporarily without undue delay upon the receipt of a valid notification, and it is disabled permanently after receiving a copy of a court order confirming its infringing character. Access to the content in question may be re-enabled as a result of a court decision, finding that no law infringement was caused through its publication.

In a majority of countries worldwide, service providers hold no liability for the content they enable access to as long as they have no knowledge of its infringing character. Therefore, it is bloggers in particular and content providers in general who are obliged to assure the legality of uploaded content. The situation is different in countries that exercise Internet filtering policies, such as China and the majority of Muslim countries, where information controls are based on state security and religious reasons. There, the burden of liability for online content rests jointly upon the content provider and the service provider.

Copyright Issues

The questionable legal status of Weblogs raises numerous copyright issues. An original copyright issue is raised by “ghost blogging.” The term describes a practice covering blogs written by a ghost author, who is not credited for his or her works—which are credited to another person. Ghost blogging resembles a practice common in

the U.S. political life, where presidential speeches are often written by unaccredited ghostwriters. While in the United States, political context ghostwriting is considered a legitimate exception from copyright protection, in civil law countries it represents a violation of the author’s moral rights, such as the right to have one’s name mentioned as the author of a work published or used. Moral rights may not be transferred, and their breach always results in liability toward the author. Therefore, ghost blogging ought to be considered ethically foul and illegal in numerous national jurisdictions.

While generally blogs are no different than any other Web site and bloggers are obliged to adhere to copyright laws, they constitute a vast resource of user-generated content, which once considered media resources may be subject to certain copyright exclusions. Article 2 of the 1886 Berne Convention for the Protection of Literary and Artistic Works in its 1979 Paris version provides no copyright protection for “news of the day” and “miscellaneous facts” as long as they have the character of “mere items of press information.” This same provision is repeated in the majority of national copyright acts, just to mention Article 3 of the Korean Copyright law where “reports on current events” and “miscellaneous reports published in newspapers and magazines” are considered non-works and offered no copyright protection. A similar provision can be found in Copyright Law for Lichtenstein, which in Article 25 repeats the exact wording of the Berne Convention. Mexican copyright law excludes from protection “articles on current events,” following the stipulation of its Article 10, paragraph 2.

Should blogs be considered press, their particular contents may be considered “mere press information” in the meaning of the Berne Convention and suffer exclusion from copyright protection. This exception relates solely to short and not-too-complex or refined pieces of information, lacking traits of individual and creative character. It may be argued that the nature of microblogs makes them a rich supply of “mere press information” whose authors hold no copyright to the messages they publish.

The Berne Convention, binding upon 166 states worldwide, in its Article 10 makes another exception from full copyright protection. Although news items generally are considered copyrighted

works, with the exception of mere press information mentioned above, the Berne Convention permits the quotations from newspaper articles and periodicals. They may be quoted in the form of press summaries in a manner compatible with fair practice and in an extent that does not exceed that justified by the purpose. Details of this form of permitted use of press information are set within acts of national laws, although such use must always be accompanied by a mention of the source and of the name of the author. French copyright law, next to quotations for informatory purposes, allows for making press summaries (*revue de presse*). This term is often defined broadly as to include compilations of news from different newspapers. Some scholars argue, however, that such broad interpretation is contrary to the meaning of the term, which ought to cover only parts of such articles. The wider definition allows news aggregation on large scale. Spanish law also allows press summaries when used as quotations, although their permitted scope is much more narrowly defined. There reviews of press are considered subject to quotation rights. They may only be used when serving analysis, comment, or critical assessment. In the case of using a press item for a press summary, the author's right to receive remuneration for such use is rarely granted and, if so, in a limited scope, although the authors retain their full personal rights, and so a mention of the source and of the name of the author must appear on such a press summary. Such forms of nonmonetary gratification are, however, often considered sufficient by community journalists and bloggers, which in turn strongly influence the traditional media labor market.

Employment

The sudden boom of user-generated content on social media platforms evoked by the rise in popularity of blogs and moblogging (mobile blogging) in particular has caused a significant shift in the employment scheme on the media market. The place of professional journalists, often working under employment contracts, is being taken by amateur bloggers, willing to provide labor without remuneration, considering the professional experience and reputation gained as sufficient reward. The power of the blogosphere is reflected in situations where a news item initiated

in the social media is repeated by mainstream media in what is called a blog storm. Individual A-list bloggers enjoy authority and user attention far greater than some mainstream media outlets. Because there are no professional management organizations reflecting the transnational character of the global electronic media, the assertion of applicable laws and a nominal fee for the use of user-generated content remain troublesome.

Bloggers often publish copyrighted works, but unlike traditional media, they are either less persistent when claiming fees for the use of their contents or are willing to offer their works for free. Blogs have therefore added to a shift in the contemporary market mechanisms, representing what has been described as peer production. This is a concept at the foundation of a new economic model, described as a hybrid economy. The hybrid economy is the economic model well suited to satisfy the demands of global online media, also when it comes to the production and management of user-generated content. It is a mix of elements from two conventional, yet thus far dichotomous, economic models: the commercial economy, in which value of goods or services is expressed in money, and the sharing economy, invaluable in money, in which love or friendship serve as the prime examples.

This categorization was harshly disrupted by the rise in popularity of user-generated content, available online for free, usually under creative commons licenses. Peer-production may usher in a new chapter in social evolution, one that has been called the "network information economy." The term is meant to cover the creation of new resources not quantifiable in currency. Peer production may soon rule world markets. Blogs represent peer production in the media market. Therefore, the media labor market, next to the entertainment industry, may be named an economy sector revolutionized by the dynamic shift in content production and sharing schemes. The value of online content is not always expressed with money, making the traditional employment contract forever less common in the media labor market.

This economic shift in media is reflected in the fact that blogs have contributed to employment uncertainty among journalists. Many of them feel obliged to use social media as a facet of their work. On the other hand, the 2012 Eurobarometer

report on Journalists and Social Media offers an insight into a recent positive tendency in the media market caused by blogs and other social media. It states that social media positively contributed to the employment in media in Ireland because Google and Facebook have located their European headquarters there, while Twitter has announced plans to do so as well.

Commercial Potential

Companies often review the contents of social media sites, including blogs seeking opinions about their products, while advertisers distribute promotional materials through online communities. The microblogging site Twitter serves as a popular source for many companies to investigate consumer concerns about their products and services. Although often published with little or no objective of financial gain, in an effort to exercise free speech, blogs hold much commercial potential.

Next to social networks, blogs are considered the crucial resource for viral marketing—promotional information published online often under the pretense of a personal view. A recommendation given by a blogger to a certain good or service intended to influence the readers to buy the item or service is considered a commercial activity when the blogger provides such a recommendation in return for personal gain, pecuniary or not. Should they not disclose the profit-seeking motivation, they may face responsibility for misleading or covert advertising, which is recognized among unfair trade practices in numerous national legal systems.

This covert marketing method is the official business practice for flogs (fake blogs, flack blogs). These are blogs that appear to present plausible, objective information while being created by a company or organization for marketing or political purposes. They are aimed at setting off viral marketing and fake grassroots campaigns. For example, the EU Directive 2005/29/EC of May 11, 2005, concerning unfair business-to-consumer commercial practices in the internal market in Article 7, paragraph 2, refers to misleading omissions and names as such a commercial practice if, in its factual context, its publisher hides or provides in an unclear, unintelligible, ambiguous, or untimely manner any information that the average consumer needs to make an informed

transactional decision. Should such an omission cause or was likely to cause the average consumer to make a transactional decision that he would not have made otherwise, such a publisher will face legal liability. An unfair advertising practice also takes place when the publisher fails to identify the commercial intent of the commercial practice, if it is not apparent from its context. Therefore, any forms of so-called grassroots marketing may fall under the definition of unfair business commercial practice, if the actual motivation of the blogger is not disclosed and the information is aimed at causing the reader to decide upon a purchase of goods or services.

Some blogs openly serve as advertising spaces. Blogs for profit and commercial blogs are emerging categories of for-profit enterprises organized seemingly as individual online diaries.

They are often organized through blog syndication. A controversial category of commercial blogs are spam blogs (splogs), which require users to follow embedded links available on the Web site. They are aimed at promoting affiliate sites and artificially increasing online traffic. In order to achieve that aim, splogs attempt to attract Web crawlers, that is, programs searching the Web for information used in search engines, with huge amounts of key words included in their contents or metadata. They rarely contain original content but rather are a set of odd words or commercial messages promoting the affiliated Web site. A splogger gains revenue for every click originating from his or her site. Splogs are considered an unwanted commercial practice, resembling spam and therefore considered contrary to existing legal regulations, either ones dealing with spam directly or unfair commercial practices generally.

Blogs, Role in Politics

Political blogs play a variety of roles in contemporary politics. Blogs adopt a variety of forms—from low-traffic, pseudonymous, single-author sites to heavily trafficked, multiauthor sites featuring blog content by political elites. Given the wide variation in blog architecture and niches, it is perhaps unsurprising that the role of blogs in politics is both complicated and variable. Some blogs serve as virtual megaphones for individual citizens to voice their political opinions. Other blogs are the functional equivalent of advocacy

groups, mobilizing large communities of interest to take collective action around elections and policy issues. Still others act to support existing institutions—both the Democratic Party and the Republican Party include blogs on their Web sites, as do most major news organizations. Then, there are blogs like the *Huffington Post* and *Talking Points Memo*, which have grown into full-fledged news organizations in their own right, creating more competition within the news environment. In the early years of the blogosphere, blogs were primarily used to challenge and pressure the mainstream media, altering and occasionally driving news coverage. Today, the two overarching themes of blogs in politics are agenda seeking and partisan reinforcement.

In the early years of the blogosphere, there was far less variation in blog types. A few prominent early moments helped craft the shared understanding of the influential role that blogs can play in politics—an influence that was largely contained within the realm of media criticism. Four

George Allen appears in a parade in Alexandria, Virginia, on February 12, 2012, during his 2012 Senate campaign. Bloggers seized on Allen's 2006 use of the word *macaca* during a videorecorded campaign appearance and used the incident to raise support for the campaign of his Democratic opponent, Jim Webb. Webb narrowly won that race, and Allen lost to another Democrat, Tim Kaine, in 2012.

events in particular, spanning from 1998 through 2006, serve as particularly important reference points. First was the central role that Drudge Report.com played in the Bill Clinton–Monica Lewinsky reporting. Second was Senator Trent Lott’s 2002 resignation as majority leader following blog-driven coverage of his controversial remarks about retired Senator Strom Thurmond. Third was the 2004 Rathergate episode, in which conservative bloggers uncovered evidence that documents relied upon by Dan Rather to make on-air accusations were likely forged. Fourth was Senator George Allen’s 2006 Macaca Moment. All four of these episodes demonstrate the power of blogs in relation to the mainstream media.

Bill Clinton

In January 1998, the editors of *Newsweek* magazine were debating whether to go to press with the story of an affair between President Bill Clinton and his intern Monica Lewinsky. Matt Drudge published the story himself on his Web site, DrudgeReport.com, under the headline “Newsweek Kills Story on White House Intern.” By publishing the story, Drudge forced the mainstream media’s hand, setting off a series of events that culminated in impeachment proceedings for the 42nd president of the United States. The *Drudge Report* is technically a protoblog. Founded in 1997, the *Drudge Report* lacks several common blog features—most notably reverse-chronological postings and reader comments. Neither the blogger.com software (developed in 1999 by Pyra Labs) nor the terms *Weblog* or *blog* existed when Drudge launched his online tip sheet. Nonetheless, the early prominence of the *Drudge Report* sent strong signals to later bloggers about the potential power of the nascent medium.

Trent Lott

In December 2002, Senate Majority Leader Trent Lott offered some remarks at the 100th birthday celebration of retired Senator Strom Thurmond. Thurmond had also run for president in 1948 on the prosegregation States Rights Democratic Party (Dixiecrat) ticket. Included in those remarks was the statement that “when Strom Thurmond ran for president we voted for him. . . . And if the rest of the country had followed our lead we wouldn’t have had all these problems

over these years, either.” Though several reporters were present at the event, the majority leader’s racially charged statement received no press coverage with the exception of a brief mention in ABC News’s online column, *The Note*.

Prominent bloggers Joshua Micah Marshall, Duncan “Atrios” Black, and Glenn “Instapundit” Reynolds seized on this comment and brought together evidence of Lott’s history of racially questionable commentary. Pressure from these bloggers influenced the mainstream media to pay more attention to the story, and the resultant cascade of media attention led to Lott’s resignation as Senate majority leader two weeks later. The Trent Lott scandal is commonly credited as the first major political impact of the blogosphere, with John Podhoretz of the *New York Post* referring to it as “the Internet’s First Scalp.”

Dan Rather

In September 2004, Dan Rather reported on *60 Minutes* about a series of memos that raised apparent questions about President George W. Bush’s service in the Texas Air National Guard during the Vietnam War. Bloggers at PowerLine-Blog and participants in the conservative FreeRepublic discussion board examined the documents and concluded that they were forgeries. The torrent of blog-based criticism led CBS to retract the story. Though it has never been conclusively proven whether the documents were indeed forgeries, the blogosphere-generated media backlash led to the forced resignation of several producers and likely hastened Rather’s retirement. The Trent Lott episode and Rathergate are commonly referenced as a pair—one blog-based success on the left, the other on the right.

George Allen

Virginia Senator George Allen’s August 2006 Macaca Moment demonstrated a different type of blog power. Allen was speaking at a campaign event in rural Virginia. A tracker from his Democratic opponent’s campaign (Jim Webb) was attending the event with a video camera. Allen departed from his stump speech and referred to the Indian-American tracker as “macaca,” asking the audience to “give a welcome to macaca over here. Welcome to America and the real world of Virginia.” Macaca is an obscure Francophone

racial slur against Algerians. The Webb campaign released the video to the *Washington Post* before posting it to YouTube, and the *Post* covered it. The liberal blogosphere—particularly DailyKos.com—seized on the video and used it to continually raise questions about Allen’s past racial comments. Progressive bloggers also used it to drive money and volunteers toward the Webb campaign, raising more than \$300,000 for the Democratic challenger. Webb went on to win the election by approximately 9,000 votes, giving the Democratic Party a Senate majority.

The macaca episode indicates a break from the previous moments of blog power. While the Drudge, Lott, and Rather examples all featured blogs forcing the media to alter coverage, the Allen episode featured the *Washington Post* breaking the story. YouTube, which was founded in 2005, also played a prominent role in this episode. Rather than challenging media organizations, bloggers in 2006 made use of the latest social media tools to directly participate in politics. *DailyKos*’s community blog architecture supported mass fund-raising and volunteering by a nationwide community of interest. Here, one sees the role of blogs in politics expanding but also becoming more varied. While community blogs like *DailyKos* leveraged social media to directly contribute to a Senate race, other types of political blogs influenced politics in different ways. To understand the evolving role of blogs in politics, it then becomes necessary to understand the varying architectures employed within the blogosphere.

Types of Blogs

As political blogging gained influence, it also was adopted by wider segments of society and adapted toward a wider range of ends. Developments in the underlying software platforms also contributed to varying uses. Political blogs can be placed within a four-part (two-dimensional) typology to better understand their technological affordances. The first dimension is open-versus-closed architecture. Closed blogs have a single author or a select group of authors. They offer slim opportunities for the audience to contribute content. Open blogs offer a diary structure, which allows the audience to act as a participatory community, adding their own content to the site. The second dimension is institutional embeddedness.

Early blogs were counterinstitutional, usually run under pseudonyms. Later blogs began to be hosted by legacy media and political institutions. A political blog hosted by NYTimes.com plays a different role in politics than a blog hosted by Blogspot.com.

This typology yields four distinct blog types. The first (closed and individual reputation) features independent blogs. All early blogs were independent blogs, and it is the standard format for the vast majority of blogs today. The second (open and individual) features community blogs. DailyKos.com is the primary example of a community blog. It is counterinstitutional in nature but acts as a gathering space for an online community of interest. Community blogs function as quasi-advocacy groups. The third quadrant (open and institutional reputation) features bridge blogs. These blogs combine the open architecture of a community site with the existing reputation of a large political or media operation. *ThinkProgress*, the Center for American Progress’s blog, and *Huffington Post* both offer examples of this format. The fourth quadrant (closed and institutional) features institutional blogs. Institutional blogs such as Paul Krugman’s blog at the *New York Times* augment traditional media and political institutions rather than challenging them. Most blogs adopt the individual format, but the most politically influential blogs tend toward the other three formats.

Partisan Echo Chambers

Noteworthy within the landscape of the (American) blogosphere is the absence of prominent centrist blogging hubs. The political landscape features high-traffic conservative blogs such as Hotair.com and biggovernment.com. It features high-traffic progressive blogs such as DailyKos.com and talkingpointsmemo.com. But, no equivalent centrist sites exist. This is indicative of the echo chamber phenomenon. As originally described by Cass Sunstein, the Internet allows citizens to seek out news and information that fit with their existing preferences and biases. Politically engaged citizens in America tend toward the poles—there is no robust, well-organized American center. While the political blogosphere has not caused political polarization in America, it has doubtless been a contributor. Whereas the

broadcast news era tended toward centrism, the postbroadcast, niche news era tends toward partisan reinforcement. The blogosphere is a major example of this echo chamber phenomenon.

Agenda Seeking

Political scientist Richard Davis has helpfully coined the term *agenda seekers* to describe the role of blogs in politics. This phrase helpfully places bloggers among other sets of actors who seek to influence the political and media agenda. The early influence of blogs in politics was as a challenge to existing media institutions. Then, those institutions adapted to the blogosphere. Today, blogs serve as a cluster of outlets for citizen engagement with politics. Bloggers, like other motivated segments of the public, seek to influence the agenda. The medium has become incorporated within the political system rather than overturning it. These agenda seekers play a variety of roles, depending both upon their goals and upon the varying blog architectures they employ. There is no singular role of blogs in politics. Rather, bloggers as agenda seekers use the medium to pursue multiple ends.

Blood Sport Campaigns

On September 5, 2012, former President Bill Clinton addressed the Democratic National Convention. "Democracy does not have to be a blood sport," he said. "It can be an honorable enterprise that advances the public interest." Though Clinton's statement seems uncontroversial, that did not stop critics from pouncing, and thanks to social media, they were able to post their thoughts instantaneously, anonymously, and globally. On Yahoo! News, for example, within seconds a dozen comments were posted under Clinton's quotation. Sixty seconds after Mitt Romney uttered the phrase *binders full of women*, Web domains were purchased under that name. The "war room" of Clinton's era—releasing documents to the press corps within a day of a scandal breaking or appearing on television hours after allegations erupt—is extinct. Campaigns have reached a new blood sport apex through social media.

Definition

The term *blood sport* comes from the Roman arena games in which violent fighting was a public spectacle at the expense of gladiators, religious martyrs, animals, and out-of-favor politicians. The goal was not just winning the fight and inflicting pain in the process but providing entertainment that draws blood and other physical portrayals of brutality. Modern-day "blood sport" can refer to recreational activities including football, boxing, mixed martial arts, and hunting, plus uncivilized practices like

dogfighting and cockfighting as well as cultural forms like bullfighting. Usage of the metaphor encompasses ritualistic, fetishistic, and aesthetic components in which the code of behavior rises from competing gamesmanship to impaling prey. Defining blood sport campaigns seems similar to the U.S. Supreme Court's definition of pornographic obscenity—"you know it when you see it." The literature provides working definitions for negative attack campaigns and common criteria for lowering turnout, and while news reports and mainstream books frequently mention the notion of blood sport campaigns, the scholarly literature provides no conceptual definition.

As a point of departure, one can combine the elements of the concept drawn from John Barry, Thomas Hollihan, and communication scholars including William Benoit, who describe the character traits in campaign combat. Accordingly, one defines a blood sport campaign as a campaign that deploys tactics designed to cause a political actor personal humiliation based on issues irrelevant to policy governance.

Growth of Blood Sport Campaigns

Every campaign season seems to sustain complaints of history's most negative advertising. Candidates benefit from oppositional researchers unsealing their opponent's divorce records, interviewing laid-off employees, scouring old college records, and tracking private receptions on video—methods not encountered in the average job interview. The political world, however, entices people into "rigid dichotomies of good and bad, we and they, in-group and out-group," states Hans Eysenck. Research indicates that, as cyberdiscourse finds itself in a marketplace with little to no regulatory intermediary, political operations become more polarized.

In an article about campaign speech in a changing digital landscape, Jean Seaton predicted that, the more advanced that technology would become, the more politics would devolve into less civilized terrain. According to Seaton, "Politics, always with an element of the blood sport, moves towards the ethics and psychology of the Roman arena, with a huge armchair audience enjoying the fighting for its own sake, and even having the thrill of a remote participation in the outcome."

Components

For a campaign to sink to the level of attaining blood sport status, six elements amid this social media revolution are necessary: (1) There needs to be orchestration. Dirty laundry is not aired on clothespins accidentally. Even if an operative is acting alone, the deed attains purposeful cohesion, and others latch onto it with like-minded aims. (2) The aim is the destruction of the other side. Blood sport campaigns do not cast aspersions on the opponent with any goal less than the other side failing. (3) The orchestrated, destructive act is targeted toward revealing something salacious. The violation is not a commonplace misdeed. It captures the imagination, wrinkles the nose, or stimulates the senses. (4) A victim is involved. The victim does not have to be a puppy or a pregnant spouse; it can be a concept such as justice or a notion such as consistency. (5) The act has to be captured manifestly. Gary Hart did not unravel when *Miami Herald* reporters were camped outside his home reporting allegations of impropriety; he was sunk when a photo emerged of him with his mistress on his lap. Howard Dean's 2004 candidacy was not upended by a poor showing in the caucus but later that night when he screamed in a unidirectional microphone. George Allen's 2006 re-election in Virginia was not sunk by his support for the unpopular Iraq war but by the infamous macaca video on a blog. Finally (6), the item goes viral. Allegations grow legs across the Internet.

Anonymity

The above six components of blood sport campaigns, and their growth, also mentioned above, are engendered more easily through social media largely because of the ease with which they can be executed anonymously. The identities of the combatants are often shielded. It is not uncommon to hear of political campaign practitioners taking their poll-tested, professional, astroturf messages to the digital airwaves cloaked in grassroots-attired anonymity. Operatives routinely create fake Twitter accounts, build comment threads on blogs, establish Facebook wall feeds, and buy Web site domains, all with little risk of being traced.

Reform

A democracy that thrives on free speech and open airwaves faces a balancing act of permitting views

that can be offensive and vulgar while aspiring for constructive decency in unrepressed argumentation. The agenda-setting process of today can often hinge on popular hashtags and memes. Citizens have gatekeeper roles, occupying virtual space, with the freedom to elevate discourse through online opinion forums or troll free public spheres for exploitative purposes. Scholars, media practitioners, and researchers argue over how to handle this new frontier with its abuses.

One proposal is censorship of comment sections on news sites. More promising are efforts by Web-based, fact-checking organizations like PolitiFact.com and Factcheck.org that adjudicate claims in political campaigns, and online ombudsmen who monitor the content of their own news forums. In the high-choice media environment, content has a tendency to police itself. Salience can build democratically. Bogus news stories have a way of not generating page views, and fringe voices are diluted. Advancements in microblogging technology, while giving rise to citizens essentially running their own printing presses and television broadcast studios, ought not abolish civil discourse in politics and allow the blood sport tacticians to contort public opinion.

Boehner, John

John Andrew Boehner (pronounced Bay-ner) became the 61st speaker of the U.S. House of Representatives in January 2011. The speaker is the presiding officer of the House, second in succession to the office of the president after the vice president and the leader of the majority party in the House. The speaker and the senate majority leader are the two most powerful members of Congress. Speaker Boehner has championed the adoption of social media technologies as an integral part of Republican House members' campaigning, constituent communication, and organization.

John Boehner was born into a working-class, Catholic family in the southwestern Ohio city of Reading in 1949. He swept floors in his family's bar at the age of eight. He was a linebacker on the high school football team. He enlisted in the Navy after high school but had to leave the service because of a bad back. He received an honorable separation. Boehner worked part-time jobs as a custodian to pay for college, graduating from Xavier University after seven years. He was the first college graduate in his family.

Career in Politics

Boehner entered public office as a member of the city council for Union, Ohio. In 1985, he was elected to the Ohio State House of Representatives. Five years later, he ran against the incumbent U.S. House representative from Boehner's district and won. To date, Boehner has held this seat for 20 years, winning re-election 10 times with little opposition in his heavily Republican district.

Boehner was one of the youngest members when he entered the House in 1991, but he became one of the Republican Party's rising stars. A member of the so-called Gang of Seven, Boehner and other first-term Republicans challenged corrupt practices such as the House Bank, a congressional office run by the sergeant-at-arms, who let Democratic and Republican House members overdraw their accounts without penalties for as many as eight months, and the House Post Office's money laundering scheme involving several prominent Democratic House leaders.

Boehner helped fellow Representative Newt Gingrich be elected the Republican House Minority Leader in 1994 and was also one of the

coauthors with the minority leader of the Contract With America. The scandals, the appeals of the contract promising reforms in Congress and in the nation's finances, and political changes outside of Congress resulted in a 1994 House election that gave Republicans majority control for the first time in 40 years.

Boehner has been an active promoter of important legislation since his election to the House. He coauthored the 2001 No Child Left Behind law with Democratic Senator Edward "Ted" Kennedy. He wrote and won passage of the 2006 Pension Protection Act, perhaps the most thorough revision of the pension system since the 1970s. He voted for the \$700 billion Troubled Asset Relief Program (TARP) to bail out banks in 2008 but opposed President Obama's health care proposal, the president's decision to withdraw American troops from Iraq, and the Democratic Party's economic stimulus plan. Boehner's policy preferences tend to reflect his support of business and his suspicions of big-government regulation. He is also one of the House's most effective advocates of government-provided vouchers for attendance at private and religious schools.

Speaker Boehner has often challenged government efforts to regulate the Internet. In 2011, Boehner denounced Federal Communications Commission (FCC) network neutrality regulations as an attempt by the government to take over the Internet. He feared that the regulations, published in 2010 to expand to broadband providers the rules now governing phone companies, would be used to control Internet content and political views. The FCC regulations sought to insure that cable customers had equal access to all online services, content, and applications. They also sought to prohibit unreasonable network discrimination. It is unclear what "unreasonable" meant.

The House of Representatives passed the Cyber Intelligence Sharing and Protection Act (CISPA) in April 2012, creating a process for private companies and the national government to share online information in order to thwart cyberattacks by foreign governments, criminals, and terrorists. President Obama threatened to veto the act, preferring a Senate version that granted the Homeland Security Department authority to monitor cybersecurity in the United States. Speaker Boehner responded that the administration wanted to

Speaker of the House John Boehner during an appearance at the Values Voter Summit in Washington, D.C., in October 2011. Boehner has been aggressive in promoting social media use by Republicans, at times having the highest Klout score in Congress.

control the Internet. Civil liberties groups feared the bill threatened individual privacy.

When House Republicans were divided over efforts to stamp out piracy of online content in bills such as the Stop Online Piracy Act, Boehner agreed not to bring the bills to the floor for a vote. The bills had become a contest between traditional media and the new social media of Facebook, Reddit, Google, Twitter, and Wikipedia. Social media saw the bill as an assault on Internet creativity and innovation. They also feared that they were being enlisted in policing Internet content for law enforcement agencies. Boehner's decision to withdraw the bills from consideration left the bills' Democratic sponsors exposed, and Senate Democratic Majority Leader Harry Reid had to pressure fellow Democrats to withdraw their support.

Boehner's reputation in the House is as someone willing to deal with all parties. A major Ohio

newspaper claims that Boehner has perfected the art of disagreeing without being disagreeable.

Boehner rose rapidly through the Republican House leadership ranks, serving as chairman of the House Republican Conference during the 104th Congress (1995–97). The House Republican Conference organizes the Republican members of the House, serves as a way for the House party leaders to communicate with their members, and helps develop the agenda for the Republican Party in the House. Chairman Boehner also led the Thursday Group, a Republican House leadership group composed of two dozen interest-group lobbyists sympathetic with Republican goals, in a highly publicized lobbying effort to raise grassroots and congressional support for the passage of the key provisions of the Republicans' Contract With America.

Boehner has served as chair of the House Committee on Education and Workforce and as the Republicans' minority leader. He became the surprise winner for the position of house majority leader in 2006 over then-Acting Majority Leader Roy Blunt (R-MO). Boehner won by promising greater independence to the committees and more involvement by the regular party members in policy decisions. He also called for limits on the practice of earmarking and on government spending.

Boehner became speaker of the U.S. House after the Republicans regained control of the House in 2011. Speaker Boehner is the first speaker to serve as his party's majority and minority leader since 1961.

Social Media

Many members of Congress quickly adopted social media when they became available. For example, Twitter came online in summer 2006. In April 2007, Eric Cantor (R-VA), the Republican majority leader and then deputy minority whip, became the first member of Congress to establish a Twitter account. Boehner was one of the first members of Congress to use Facebook as a way of contacting constituents and other Americans. Almost 300,000 Facebook contacts were logged on his account (@SpeakerBoehner) by June 2012.

Boehner recognized the advantages of social media as a political weapon deployed by the minority party against the majority party in the

House. He led many members of his party in an orchestrated series of demands for the House Democratic majority to return to the floor when then House Speaker Nancy Pelosi (D-CA) gav-eled the session to a quick end on August 1, 2008, when an important energy bill sat ignored on the House's agenda. The Republican demands for reopening the session were publicized by the members' streaming videos, tweeting, and texting from their personal cell phones and laptop computers.

Barack Obama's successful 2008 presidential campaign showed how to enlist social media and networking as ways to raise campaign contributions, persuade voters, and connect with supporters. Then-Minority Leader Boehner used this demonstration of social media's power to challenge his party members to increase their use of these technologies. In their weekly party meetings, they discussed how to effectively use social media tools and which tools were the most successful.

Boehner promised that the party would have an electoral advantage over the Democrats if they became expert users of the new media forms. Boehner taught by example, becoming one of the House's most frequent tweeters and holder of Congress's highest Klout score. A Klout score tracks the frequency of a person's name appearing in seven different social media forums.

Social media's ability to direct unfiltered messages to the public make it vastly preferable for members who worry that the print and electronic press may adversely affect the timing and content of their messages. Republican members are especially sensitive to the limits of traditional media forms because of a feared liberal bias among journalists and media elites. Television and radio are costly and may be limited in their geographical reach. Social media permit communicating direct partisan and election appeals, unlike the franking privilege, the member's ability to contact their constituents through free postal mail, which prohibits such campaigning.

The 2010 congressional elections were a watershed moment in social media history. Almost every candidate running for Congress or a state gubernatorial seat used Twitter. Minority Leader Boehner, working with his minority whip, Eric Cantor (R-VA), and chief deputy whip, Kevin McCarthy (R-CA), set up a Web site eliciting public input to create a policy agenda for the 2010 congressional

campaign. America Speaking Out continues to attract online and Twitter feeds.

Boehner's staff orchestrated an aggressive virtual campaign that helped 85 new House Republicans to be elected in the 2010 House elections. Teams of staffers generated rapid response tweets, e-mails, YouTube ads, and targeted messages to news media pointing out opponents' gaffes, inconsistencies, or alleged falsehoods. They used online virtual worlds such as Second Life to promote partisan positions. Social networking technologies directed supporters of candidates to campaign Web sites where they could make political donations. Once in office, these new Republican members were taught how to be savvy users of social networking skills.

The House speaker has used social media to help mobilize interest groups and shape and monitor public opinion. Social media also permit gauging constituent opinion and can reach out to new followers. House Republicans were early adopters of Visible Vote, a digital media application that seeks to provide immediate communication between elected officials and their constituents.

The Republican leadership prompted House committees to adopt both Facebook and Twitter. The House Financial Services and the Foreign Affairs Committees instituted a service through which citizens can send questions to ask witnesses at committee hearings. Republican Party leaders launched a Facebook application listing "where the jobs are" in 2011.

Boehner's pioneering efforts with social media and networking has affected the House profoundly. VoterTide's 2012 Social Media Index placed seven Republican office holders on its top 10 nonpresidential-candidate list of politicians who are the most linked and have the greatest impact on online sites. Boehner authorized Facebook's first live streaming of a House session. It occurred on January 4, 2011, during Boehner's formal election and assumption of the office of speaker. The House Republicans streamed a live presentation of President Obama's 2012 State of the Union address accompanied by real-time fact-checking and a social question-and-answer forum on their social media sites.

A 2012 Pew study found that Republican members of the House were three and a half times more likely to mention legislation and 60 percent

more likely to contain multimedia links than were Democratic members. This study also found that Republican House members not only used social media more often than their Democratic Party colleagues but also that their tweets were both more substantial and more often retweeted than were those of Democrats in the House. Republicans also outpaced Democrats in the number of followers on their Twitter lists. Only two Democrats were among the top 20 members of Congress with the largest Twitter followers.

Conclusion

The adoption of social media is strikingly different from earlier adoptions of new technologies by members of Congress. Most congressional offices did not use e-mail until the mid-1990s. Regular televising of House and Senate proceedings did not occur until 1979. Fewer members of the House were first adopters of faxing or individual Web sites. The primary reason for the speed in which social media have been adopted is the urging of key party leaders such as John Boehner. Under his leadership, the U.S. House of Representatives and especially House Republicans have entered the social media age.

Bookmarking

Bookmarking is the action of marking a Web site on a person's browser so that the person can easily access it for later use. This function is considered to be very significant, especially for users who are interested in visiting regularly a number of Web sites and they are unable to remember all the uniform resource locators (URLs), or they want to note interesting Web pages in order to read them later. The use of bookmarks speeds up the process of browsing and eliminates connection errors caused by errors that may occur when typing a URL. The bookmark is stored in any of various storage formats. All Web browsers include bookmark features. Bookmarks are accessed through a menu in the user's Web browser and can be organized in folders for easy access to stored URLs.

In addition to bookmarking methods offered by browsers, many external applications offer bookmark management. In the political realm, as in the business sphere, the rapid proliferation of social media combines with the relative ease of mining user identification and preference information. This permits interested parties to use social bookmarking, in combination with other "tagging behaviors," as a way to collect what users think of as private material in order to create detailed user profiles. These profiles can then provide the basis for sales, propaganda, and/or political campaigns. While this practice is of concern to a growing number of social media and political scholars, it remains completely unknown and invisible to most of the buying—and voting—public.

Bookmarks first appeared in browsers back in 1993. The first browser to offer this function was Mosaic, and they were called Hotlists. Today, all different browsers incorporate a built-in bookmark manager that controls the list of bookmarks. The list storage method varies, depending on the browser, its version, and the operating system on which it executes. One method includes storing bookmarks in an HTML file (usually called `bookmarks.html`). This approach permits publication and printing of a categorized and indented catalog and works across platforms. With this method, it is not necessary for bookmark names to be unique. Other browsers store bookmarks

in a secure database format (SQLite). Internet Explorer's Favorites are stored as individual files. One problem that computer users have to tackle is the fact that, when they change their personal computers, they have to remember to back up, among other things, their bookmark lists. Thus, all browsers offer the function of exporting and importing the bookmark list. Also, many browsers (more precisely the later arrivals—Firefox, Chrome, etc.) include the function of importing the list of bookmarks of other browsers (usually Internet Explorer).

Users usually tend to gather many bookmarks. But, bookmarks are only useful if users keep them organized in a way that makes them easy to find again. On many occasions, organization in folders is not enough. Firefox supports assigning tags to bookmarks for easy searching. It can be time-consuming, but it does allow the user to have the same bookmark in multiple tag bundles. Firefox also introduced live bookmarks that contain a list of links to recent articles supplied by a news site or Weblog, which is regularly updated via Rich Site Summary (RSS) feeds. Thus, they allow users to dynamically monitor changes to their favorite news sources. Instead of treating RSS feeds as HTML pages like most news aggregators do, they are treated as bookmarks that are updated in real time with links to the appropriate sources.

Today, many users work on multiple computers during the day. The problem is that, if a person works on multiple computers, keeping up with bookmarks requires that person to bookmark the same sites on every computer. This problem was solved by introducing bookmarking Web sites that give the user on-the-go access to links anywhere Internet access is available. A typical example of such a service is Google Bookmarks, which was introduced in 2005. Google Bookmarks is a free online bookmark storage service available to Google account holders. Users can access their bookmarks from any computer by signing onto their Gmail accounts. The bookmarks are searchable, and searches are performed on the full text of the bookmarked pages, not just the labels and notes. It is worth noting that this service is completely separate from browser-based bookmarking and should not be confused with the bookmark function on any popular browser, Google

Chrome included. It is a cloud-based service that allows users to bookmark favorite Web sites and add labels, tags, or notes. Other browsers offer similar services. An extension of the above service is social bookmarking, which enables users to add, annotate, edit, and share bookmarks of Web pages.

The term *bookmarking* is also employed in various services with a similar function. For example, in Facebook a user can bookmark a Facebook app, group, or page in order for it to constantly appear in the left-hand corner of the home page. The term *bookmark* is also employed in various applications (e.g., word processing) in order to indicate a location in a document that a user wants to access immediately.

Born This Way Foundation

Founded in 2012 by popular music star Stefani Germanotta (better known as Lady Gaga), the Born This Way Foundation uses social media and advocacy to improve the lives of lesbian, gay, bisexual, transgender, and queer (LGBTQ) youth. The organization works to achieve this mission through communication campaigns directed at youth, through public advocacy, and by funding research to identify the causes and possible solutions to the problem of bullying. Along with Germanotta, the Berkman Center for Internet and Society at Harvard University, the MacArthur Foundation, and the California Endowment are also founding partners. The organization is led by cofounder and president Cynthia Germanotta.

Aims and Activities

The foundation employs a three-pronged strategy in its mission to support and empower LGBTQ youth. It has identified the three pillars of this mission as safety, skills, and opportunity. The organization promotes the first component, safety, by providing an online space where young people can communicate openly with each other without fear. Despite advances in gay rights and the increased visibility of young people coming out as gay, bisexual, or transgender, bullying and the psychological toll it takes on youth is a persistent problem in the United States. Accordingly, with a mantra of building a kinder and braver world, the organization's first interactions with youth encourage social acceptance, safety, and community. Second, focusing on skill building, the Born This Way Foundation provides young people with training in public advocacy so that they can experience not just self-acceptance but self-efficacy. By providing training and resources to support civic engagement, youth may feel empowered to create change on their own behalf. Finally, the organization aims to provide specific opportunities for young people to become involved in programs that promote change within their local communities.

History and Core Values

Launched on February 29, 2012, the foundation is housed at Harvard University, a site that

Lady Gaga on tour for her 2011 Born This Way album in Stockholm, Sweden, on August 30, 2012. Her foundation of the same name uses social media to empower lesbian, gay, bisexual, transgender, and queer (LGBTQ) youth.

reflects the organization's seriousness and its focus on research as well as advocacy. Its debut attracted widespread national publicity due to the fame of its founder Lady Gaga and the involvement of high-profile entertainers and other leaders, including former television talk show host and media entrepreneur Oprah Winfrey; inspirational speaker Deepak Chopra; and Secretary of Health and Human Services Kathleen Sibelius. The foundation also benefited from its founder's fan following at its launch, attracting more than 100,000 registrants to the site in its first week.

During a series of interviews around the launch with national news organizations that attracted a general audience as well as youth-oriented media like MTV, Germanotta (Lady Gaga) described an idealistic and value-driven vision for the foundation. She characterized its ultimate goal as promoting love, acceptance, and unity. At their core,

these goals center on the creation of nonheteronormative attitudinal and behavioral changes in relation to sexual identity.

Germanotta also pledged that Born This Way would foster a culture of acceptance by discouraging bullying and by encouraging young people to actively challenge bullying when they see it happening around them. This is a distinguishing feature of the foundation's mission and the type of social change it seeks to promote. Guided by research on social media best practices from its founding partner, the Berkman Center, the organization conveys the message that LGBTQ youth and allies need to all contribute to creating a culture that is not just kinder and more accepting but also braver through its public communications, starting with the tagline "Empowering Youth. Inspiring Bravery." This slogan echoes the refrain of Lady Gaga's popular song, "Born This Way" from which the foundation gets its name. Promoting the belief that sexuality is a fundamental, intrinsic component of individual identity, the song became an informal gay anthem when it was released in 2011. Its lyrics proclaim not just that she was "born this way," meaning different, but also that "I was born to be brave."

Beyond the slogans and the song, the foundation promotes this core value through a variety of communications. It solicits stories of bravery from members and visitors to the Web site as well as ideas about how to build what it describes as kinder and braver communities. Consistent with the three pillars of its mission statement, by claiming bravery as its core value, the Born This Way Foundation marries the positive ethos of the gay pride movement with a more demanding normative model of citizenship that requires vigilance, activism, and civic engagement as well as affirmation and visibility from its followers.

Bottom-Up Campaigns

In recent years, the increased use of social media and the development of information and communication technologies (ICTs) have led to a significant transformation of society. Without a doubt, it also has caused substantial alterations in many areas of politics, especially in the methods of communication. Recent research has reported the potential role of social media as strengthening ties between political actors and the public. Ultimately, a healthy democracy, as currently being pursued by contemporary society, results from an accurate reflection of public needs. From this perspective, the introduction of social media has been welcomed in politics due to its characteristics in terms of being an interactive communication medium. Many observers expect social media to be a vehicle to encourage the public to engage in political activities, and the effective use of social media could be a way to overcome problems in the current political environment, such as political cynicism, political apathy, and low levels of political participation.

In general, bottom-up campaigning can refer to a campaign that is not organized by political parties or elites, but is arranged by the public. Unlike the traditional custom of political behavior pursued in the top-down manner of the political process, bottom-up campaigning is characterized by political activities of citizen groups who have acquired new political power due to the ability to deal with social media and to mobilize like-minded people to reach their final political aims. That is, the development of social media have consequently transferred prime political

work such as mobilizing people and presenting social and political issues from political elites to the public. Although academic discussions on the importance of bottom-up campaigning have been mentioned in many different political subjects, it has been paid more attention due to the recent political events in 2010 in the Middle East and north Africa, known as the Arab Spring.

Arab Spring

Arab Spring refers to the antigovernment demonstrations that occurred in the Arab region in late 2010. Starting in Tunisia, both large- and small-scale political campaigns were initiated against each of the long-term governments in more than nine countries, such as Algeria, Bahrain, Jordan, Egypt, Morocco, Yemen, and so on. Most important, these demonstrations were organized by citizen groups who were good at utilizing social media such as YouTube, Facebook, and Twitter. Facebook and Twitter, especially, assumed central roles in spreading the news about uprisings, forming and sharing political opinions, and encouraging the public to take part in the demonstrations. The government's attempts to suppress information via the Internet ended in failure because the public's common desire to change the regime proliferated through social media platforms; thus, any control over communication and information about uprisings that was uploaded by people on the Internet was beyond the government's capacity. As a result, the uprisings in the Arab region have been considerably successful for the public.

These unprecedented political events suggest two momentous implications: (1) the gradual rise in importance of bottom-up campaigning created by the advent of social media, and (2) the possibility of transformation from the traditional political process in which political elites are empowered to deal with the determination of political issues to a new democratic process in which public opinion is equally reflected in those outcomes. The use of social media has therefore increased, and its popularity has meant the public now has a way to freely express their political thoughts. Accordingly, the public is now becoming empowered to take over political matters that were typically the responsibility of political elites, such as mobilizing the people and forming political agendas, as noted earlier.

Howard Dean Campaign

On the other hand, the significance of bottom-up campaigning is also mentioned in the research area of election campaigning. Academic discussions regarding this matter began with Howard Dean's 2004 campaign for the Democratic presidential nomination in United States. Despite his failure to gain the nomination, his campaign is considered one of the first attempts at utilization of the Internet as a political communication medium. During his campaign, his national campaign director, Joe Trippi, used the Internet for fund-raising, and his primary works were to manage campaign blogs such as Dean for America and to update the Web site Meetup.com to communicate with the potential voters. Meetup.com is a social networking Web site that allows people who have common interests and hobbies to come together in online as well as offline discussions to be able to connect to each other.

Although Dean's Internet campaign is widely considered as an innovative campaign strategy and the creation of a new form of campaign communication using a bottom-up approach, many observers have mentioned that it failed to make a strong tie with voters at that time.

Barack Obama Campaign

Afterward, some of the ideas of Dean's campaign strategy were further developed in Barack Obama's campaign in the 2008 U.S. presidential election. At that time, Obama and his camp realized that the traditional campaign style, a top-down approach, was no longer as effective as it once was. Furthermore, he needed to challenge the Hillary Clinton campaign, which was firmly organized with skilled campaigners who had technical knowledge in managing campaigns. In particular, a lack of awareness of his brand, compared to that of Clinton, was a first priority. Taking all things into consideration, Obama chose social media to inform the public of his brand and to gather support across the country. For instance, he created his own social networking Web site, MyBarackObama.com, and initiated some Web pages for fund-raising and group e-mailing to promote voting. Similar to other social networking sites, participants could create their own profiles and invite friends to their personal blogs. It also meant that Obama and his team fully understood the

characteristics of social media and the increased influence of voters resulting from the widening of communication channels that enabled them to engage in political activities.

In particular, the central point of difference between the Obama campaign and other campaigns was that it combined a traditional campaign organization, which mainly consisted of campaign professionals and skilled staff, with a new style of campaign organization, which consisted of grassroots people. This led to extensive grassroots help by assigning professional tasks to volunteers. The volunteers tried to find out how they could help Obama's campaign without any supervision from national campaign staff. They organized casual meetings by themselves to discuss political issues and to share their thoughts about campaign issues. They also canvassed to encourage people to vote for Obama. Those activities by volunteers were not designed by the central campaign organization but managed by the volunteers themselves. Although the central campaign staff trained volunteers to distribute their campaign messages, they did not direct how to spread these messages to others. That is, the staffers in the central campaign organization played a role in spreading unified campaign messages to volunteers, while grassroots people took over the role of distributors of the message.

Various arguments have been presented on whether Obama's campaign could be seen as a true bottom-up campaign in that the central staffers trained the volunteers to spread their campaign message. Nonetheless, it is meaningful that Obama's 2008 campaign has led to a remarkable change in terms of a new form of utilization of mass media, especially in the use of the Internet, and the management of campaign organization compared to most traditional campaigns. Unlike the top-down approach method of traditional campaigning, in which campaign professionals and political elites manage all the campaign activities, the Obama campaign enabled voters to get involved in many kinds of campaign activities and to be empowered to handle campaign responsibilities on their own. Given that it is not possible to manage the election campaign solely by political parties or candidates or the voters, it is possible through the cooperation of all three of these actors; the Obama campaign could then be

considered as a successful example of a bottom-up campaign.

Conclusion

Because different forms of social media such as YouTube, blogs, Twitter, podcasts, and social networking services by mobile application have been quickly introduced into politics, it is true that many alterations, especially in the form of communication between political organizations and the public, have taken place. Furthermore, there is no doubt that the development of social media has opened doors to allow the public to engage in political activities and to raise political agendas whenever they want. It also means that they are no longer passive actors in expressing their political thoughts, and they are empowered by the development of social media to achieve their political aims.

As explained earlier, the utilization of social media by the public in the case of the Arab Spring has shown the significant influence of social media in the political process, and it has proven that the public can change the world with efficient use of social media. It could be regarded as a typical example of bottom-up campaigning. Perhaps a bottom-up campaign could help to revitalize politics and lead to a healthy democracy because the party organizations would need to accept the various opinions of the public, as mentioned in the research. Therefore, the importance of bottom-up campaigning cannot be overlooked at least in terms of the establishment of genuine democracy.

Bounce Back

In its litigation with Samsung, Apple relied on several of its patents to argue that its iPhone and iPad were completely novel or, as Apple attorney Harold McElhinny stated, that its iPhone and iPad had "created an entirely new product category." Some of those patents referred to the design of the devices; for example, U.S. Patent D593087 covered the ornamental patterns and U.S. Patent D504,889 the schematic drawings. Others of those patents referred to the features of the devices; for example U.S. Patent No. 7,469,381 addressed the bounce back effect, U.S. Patent No. 7,844,915 on-screen navigation, and U.S. Patent No. 7,864,163 tap to zoom.

U.S. Patent No. 7,469,381, or in brief '381, was issued on December 23, 2008. The registration document lists Bas Ording as its inventor. Ording is also credited with inventing the dock magnification (user interface for providing access) for Mac OSX, and worked at Apple until July 2013. As specified in Walter Isaacson's biography of Steve Jobs, Apple's chief executive officer was approached in the lobby of the company by a young designer who showed him a way to fit more icons in the dock at the bottom of the screen. The young designer was Ording, and Jobs hired him on the spot. Jobs was fond of many of Ording's projects, and he was particularly connected to the bounce back effect described in U.S. Patent No. 7,469,381. The '381 patent abstract reads as follows:

In accordance with some embodiments, a computer-implemented method for use in conjunction with a device with a touch screen

display is disclosed. In the method, a movement of an object on or near the touch screen display is detected. In response to detecting the movement, an electronic document displayed on the touch screen display is translated in a first direction. If an edge of the electronic document is reached while translating the electronic document in the first direction while the object is still detected on or near the touch screen display, an area beyond the edge of the document is displayed. After the object is no longer detected on or near the touch screen display, the document is translated in a second direction until the area beyond the edge of the document is no longer displayed.

Thus, the bounce back effect is a method for list scrolling and document translation, scaling, and rotation on a touch screen display. This is what gives scrolling on an iPhone its rubber band-like bounce. When a user places a finger on a device screen, drags an image or document past the screen's edge, and then releases the finger, the image or document bounces back to fill the full screen. In other words, if a person scrolls too far on an iPhone, whatever he or she is looking at bounces back into position. The ongoing conflict between Apple Inc. and Samsung Electronics Co, Ltd. has in part been fuelled by the fact that, after Apple patented the bounce back effect and featured this effect on its products, Samsung also adopted a similar feature, and as such, all of the Samsung Galaxy phones have a bounce back effect.

However, in October 2012, the U.S. Patent and Trademark Office invalidated Apple's bounce, scroll, or rubber-banding patent. The patent was rejected on prior art considerations, including one concerning a controlling content display by AOL/Luigi Lira published by the U.S. Patent and Trademark Office in 2003 and another regarding a continuous scrolling list with acceleration by Apple published by the U.S. Patent and Trademark Office in 2007. The U.S. Patent and Trademark Office claims that no inventive step was found between the prior art and Apple's patent, and therefore it was now up to the company to prove to the patent office or the appeals court that the patent was new. As for Samsung, it already found a workaround to avoid infringing

the overscroll bounce patent, but it would likely reintroduce the feature if Apple could not back up its patent.

As patent blogger Florian Mueller asserts, it is not surprising that the '381 patent faced challenges to its validity because the bounce back effect constituted a great achievement in the realm of user-interface psychology, but in a strictly technological sense, it had little merit. Additionally, as a commenter on Mueller's blog affirms,

There is no doubt that Apple has done the best job in realizing the rubber band idea into their iOS GUI. You really have to give Apple credit for that. . . . However, just the fact that you have done it well doesn't mean others have no right to do it and catch up.

Moreover, as an analysis by Global Innovation Commons reveals,

The breadth of the intellectual property listed in this lawsuit seems to imply that Apple is desperate to do anything in its power to hamper the market acceptance of Samsung's phones and tablet. Unfortunately, in its attempt Apple may have exposed an inherent weakness in its patent holdings. The absence of certain of its own patents in the cited art of the '381 patent represents, at best, ignorance on Apple's part. This issue, as well as others, may present significant challenges in Apple's suit against Samsung.

Bounce Back Effect

The bounce back effect has been one of the points of contention in a series of ongoing lawsuits between two giant technology corporations, the U.S.-based Apple Inc. and the South Korean-based Samsung Electronics Co, Ltd., regarding the design of smartphones and tablet computers. In the course of the trials, Apple representatives alleged that Samsung products had infringed upon Apple intellectual property by violating several Apple patents, including the bounce back patent for an animation that produces a rubber band effect when a user scrolls past the end of a window on an iPhone or iPad.

In 2010, Samsung supplied Apple with iPhone and iPad components with a value of \$5 to \$7 billion, according to a *Financial Post* report from August 25, 2011. However, Samsung's Galaxy line of products comprising smartphones and tablets is also a competitor of Apple's iPhone and iPad. In early 2011, Apple launched accusations that Samsung's Galaxy smartphones and tablets slavishly copied Apple's iPhone and iPad. However, because patents, trademarks, and designs are registered all over the world, the dispute could not be solved in the courts of a single country, and as such, the two companies started many suits and countersuits in different countries in various parts of the globe.

Apple first filed a complaint against Samsung on April 15, 2011, in the United States District Court of the Northern District of California. The 38-page document submitted by Apple included federal claims for patent infringement, false designation of origin, and trademark infringement,

as well as state-level claims of unfair competition, common law property infringement, and unjust enrichment. Samsung also filed multiple complaints against Apple, the first of which was on April 22, 2011, at the Central District Court in Seoul, South Korea. This was shortly followed by trials started by Samsung against Apple in Tokyo, Japan, and in Mannheim, Germany, as well as at the British High Court of Justice, the United States District Court for the District of Delaware, and the United States International Trade Commission.

In June 2011, in the U.S. District Court in San Jose, California, Judge Lucy Koh, a Harvard-educated former federal prosecutor who had also served on the California state bench and as a partner in a Silicon Valley law firm where she litigated technology patent lawsuits, attempted to appeal to company representatives' goodwill. According to a *Bloomberg Business Week* report from March 29, 2012, Judge Koh noted, "Last time you were here you said that you had a business relationship . . ." She then wondered, "Can we all just get along here? Can I send you out to ADR," referring to alternative dispute resolution, a form of private mediation. "I will send you with boxes of chocolates," Judge Koh said. "I mean, whatever." Yet, Apple did not conciliate with Samsung but rather returned in February 2012 to the U.S. federal courthouse in San Jose to sue Samsung again.

In this lawsuit, Apple won decisively against Samsung. On August 24, 2012, after just three days of deliberations, the nine jurors on the case found that Samsung infringed Apple's patents on iPhone's bounce back effect (U.S. Patent No.7,469,381), on-screen navigation (U.S. Patent No.7,844,915), and tap to zoom (U.S. Patent No.7,864,163), as well as design patents that cover iPhone features such as home button, rounded corners, and tapered edges (U.S. D593087) and on-screen icons (U.S. D604305). However, the jury concluded that Samsung did not infringe Design Patent 504,889 regarding the ornamental design of the iPad. This jury awarded Apple \$1.049 billion in damages and Samsung zero damages. Apple's attorneys subsequently filed a request to stop all sales of the Samsung products cited in violation of the U.S. patents, but this request has not been granted by the court.

Apple won the ruling in the United States, but it did not win many of the international rulings.

In August 2012, a three-judge panel at the Seoul Central District Court in South Korea delivered a split decision, declaring that Apple infringed two of Samsung's wireless patents, while Samsung violated one of Apple's utility patents, namely the bounce back effect. The court awarded small damages to both companies and ordered a temporary sales halt of the infringing products in South Korea, although none of the banned products were the latest models of Samsung or Apple devices. Also in August 2012, a three-judge panel at the Tokyo District Court in Japan decided that Samsung Galaxy products did not violate Apple technology patents and awarded legal cost reimbursement to Samsung.

In Europe, the results of the lawsuits were mixed. A court in Germany initially granted Apple's request to bar Samsung from selling Galaxy products in the European Union, but after hearing Samsung allegations that Apple evidence was tampered with to make the dimensions and features of the two firms' products seem more related and similar, this court rescinded the decision. The British High Court of Justice ruled that Samsung products are not too similar to Apple's but refused to grant Samsung a request for banning Apple products from the British market. In turn, Samsung unsuccessfully attempted to obtain court orders in France and Italy to bar Apple products from the markets in these countries.

Meanwhile, additional developments out of the courts have thrown doubt on Apple's big victory in the U.S. federal court. In October 2012, the U.S. Patent and Trademark Office ruled that 20 patents relating to scroll technology lacked novelty and therefore invalidated Apple's patent on the bounce back effect. As Tim Worstall explained in a *Forbes* article on October 23, 2012, patents are granted for things that are new and inventive, and the U.S. Patent and Trademark Office pointed out that Apple's scrolling bounce back was anticipated by products of other firms, and as such, it was neither new nor inventive.

Based on claims that Apple tampered evidence and that the jury foreman was not honest, as well as on arguments regarding rubber banding patent invalidation and lack of feature novelty, Samsung appealed the previous decision of the California court. The ruling was expected during December 2012, but court hearings have so far revealed an

inclination of Judge Koh to reduce the amount to be paid by Samsung to Apple. Regardless of what happens in the U.S. court, the Apple-versus-Samsung litigation, including the fight over the bounce back or the rubber band effect, showcases the fierce global competition for consumer mobile communications.

Brave New Films

Brave New Films was founded in 2004 by Robert Greenwald, an award-winning film and television director who left industry to pursue independent production. With an emphasis on social justice, Brave New Films uses traditional and new media to encourage people to support their campaigns. Centered on documentary and short video productions, these campaigns come from a strongly liberal perspective. Common themes link these campaigns, and the organization's strategies include strategic use of digital media and alternative distribution techniques and mobilization techniques to encourage people's involvement. These activities create some impact, and they also draw criticism.

Brave New Films pursues campaigns that focus on holding corporations, politicians, and others in positions of power accountable to the public for their statements and activities. One theme in these campaigns focuses on corporate responsibility to the public, as with the documentaries *Wal-Mart: The High Cost of Low Price* or *Koch Brothers Exposed*. Another theme centers on the media's responsibility to the public, targeting particularly Fox News, as seen with the documentary *Outfoxed* and the Web series called *Fox Attacks*. A third theme focuses on government and political responsibility. The campaigns target Republicans and Democrats alike, such as on former New York City mayor Rudy Giuliani and Connecticut Senator Joseph Lieberman.

Earlier campaigns were built around documentary productions directed by Greenwald, with dedicated Web sites and social media connections. Walmartmovie.com boasts 2,500 pages about the global retailer's techniques for keeping costs down at the expense of its employees and the environment. With the growing popularity of YouTube, Brave New Films moved some of its campaign activities online and even moved away from the documentary-centered campaign.

More recent campaigns use series of short videos. For example, the popular *The Real McCain* campaign looked for and revealed inconsistencies in the 2008 presidential candidate's campaign through videos that juxtaposed clips of McCain's speeches and media appearances with clips from other media and interviews that provided counterpoints. One video, "McCain's YouTube Problem Just Became a Nightmare," drew 9 million views on YouTube, going viral. The viral video—or a video that gains popular and media attention rapidly within a compressed time period—functions as a key part of their distribution strategies.

Alternative distribution strategies augmented with social media help Brave New Films sidestep mainstream media in order to reach audiences directly. Several sites and YouTube offer free viewings of entire documentaries, such as *The Real Rudy*. *Slacker Uprising*, about Michael Moore's speaking tour, was offered to viewers who registered for the Web site for free downloading. On iTunes Brave New Films offers podcasts and downloads of some documentaries. The YouTube

John McCain announcing his candidacy for president on April 25, 2007, in Portsmouth, New Hampshire. Brave New Films used short videos on YouTube, one of which was seen by as many as 9 million people, to challenge McCain's campaign.

channel features more than 500 videos, drawing more than 52 million views. With the advent of Brave New Theaters, interested citizens can use the documentaries available to organize their own community screenings and discussions. The documentaries listed come from Brave New Films and other independent documentary makers.

Project-specific Web sites organize campaign activities in a central location. In addition to embedded videos, the sites usually feature a blog, background information, and press coverage. All sites encourage viewer interaction so long as comments remain respectful. Almost all recent campaigns include social media connections with Facebook, YouTube, Twitter, Podcasts, Digg, and Google+. Among these, Facebook sees the most activity, with regular wall posts to issue-related press coverage and short videos, but those activities occur only during the peak times for the campaigns. The Facebook activities remain secondary to the dedicated sites.

Alongside raising awareness, these campaigns encourage audiences to act. They suggest connecting to or using social media, such as liking on Facebook, tweeting on Twitter, or sharing on Digg. Other suggestions encourage writing blog posts, hosting screenings, writing letters to or calling politicians, signing petitions, and learning more about issues. They also solicit donations, and the organization uses Nationbuilder to help collect those monies. As incentives, those donating can receive various merchandise, such as posters, specially designed T-shirts, and DVDs and DVD sets of their films. As a 501(c)4 organization, Brave New Films relies on those donations to operate independently.

Even with all these efforts, not all campaigns succeed. When the Saints Go Marching In featured a short video and signature campaign that drew more than 120,000 signatures toward swaying one senator to vote for the Gulf Coast Recovery Act. The bill died in Congress. Further, Brave New Films and Robert Greenwald draw strong backlash from right-wing media and other critics. Fox News figure Bill O'Reilly went so far as to call Greenwald "a ridiculous human being" and "just to the right of Fidel Casto." Brave New Films posted that footage to its YouTube channel with a response.

Buzz Creation

Buzz creation is a systematic and organized effort to encourage people to talk about a particular organization, institution, person, brand, product, or service and to recommend spreading it to others that are part of their relational networks. The word *buzz* literally refers to a low, continuous humming or murmuring sound, made by or similar to that made by an insect. In common usage, a buzz refers to a rumor, and buzz creation refers to the making of hype, or interest in something.

Buzz is created when a receiver is captured by a message because of curiosity and interest. If the receiver considers the message interesting, fascinating, and entertaining and trusts the source, he or she will not only be influenced by its contents but may also spread it to his or her relational network.

The creation of a buzz is thus directly related to the creation of an appealing story around an event, institution, organization, person, product, or service. Stories that deal with taboo topics such as sex, deceptions, bathroom humor, or unusual, outrageous, or hilarious topics, as well as remarkable stories and stories about secrets (both kept and revealed), often create a buzz.

Buzz also becomes viral through the help of advocates, likewise known as testimonials or ambassadors that support the message contents and are willing to help the sender of the message to distribute it themselves. Most effective communications are those based on personal recommendations made by fellow individuals whose comments are less likely to be viewed as corporate sponsorships. However, not all advocates are equally successful at creating buzz. A number of studies show that the most effective buzz is created by those individuals with strong recognized personal influence characteristics, such as celebrities and those who have large and extended relational networks. These studies also show how personal influence is directly linked to the diffusion of an innovation, that is, the extent to which a new product or discovery is adopted by a group of people and to the

circulation of commentaries. In other words, certain conversations expand faster and into larger groups of society because of the influential role and relational network of the advocator.

While the history of oral traditions is very ancient, only in the past decade have organizations, institutions, and political entities sought to capitalize on the impacts of personal influence in people's opinion formation and behaviors to create one-to-one conversations with those who heavily influence their peers. In marketing, scholars introduced the concept of buzz marketing as synonymous to word-of-mouth marketing, which refers to interpersonal communication between noncommercial sources about a commercial issue. Buzz marketing is a strategy to amplify initial marketing efforts by third parties through their passive or active influence in order to create positive feelings. By creating sophisticated buzz campaigns, marketing people can attract individuals and make them believe that they are influencers and thus convince them to spread the word to their friends and colleagues. Other times, organizations hire people to actively share contents on their networks on behalf of the organization and thus support buzz creation.

Not all buzz creation is positive. Large corporations, and also governments and political actors, can be targets of anticorporate groups, dissidents, and activists who can use similar marketing techniques to create and spread negative buzz about them. Leaks about organizations' and personalities' scandals often become buzz because of the secrecy and outrageous nature of the events and the inner human attraction to these types of stories. Ongoing negative buzz is potentially dangerous because it can later turn into a crisis.

With the event of information and communication technologies, the Web, and especially social media, buzz creation has increased and gained new forms of practices. Influencers use online media in the forms of e-mail, blogs, listservs, personal Web sites, chat groups, and consumer rating sites to disseminate ideas. YouTube is one of the most-used social media for creating buzz, especially when an organization creates and posts funny videos that not only attract viewers but also stimulate sharing among them. Organizations can also hire people so that they can speak positively about the organization, products, or services

on their social network sites. Blogs are popular media for electronic buzz marketing campaigns. Marketers trade products or pay for bloggers' promotion among their followers. Instant messaging (IM) applications are considered a vehicle for carrying out buzz marketing campaigns, with either humans or IM bots doing the pitching. IM bots are programs that attempt to stimulate conversation as if they were real humans.

Ethical concerns have risen in relation to disguised marketing activities that create buzz, for example, when organizations deliberately engage people to influence other individuals who do not realize they have been recruited and become themselves promoters among their social networks. This approach is known as undercover marketing or stealth marketing and is based on the idea of creating buzz around a product or service so that consumers market the product to others through a network of referrals, which expands. Despite the fact that buzz creation for undercover marketing practices has been considered unethical and deceptive in the code of conduct of the Word-Of-Mouth Marketing Association (WOMMA) and the American Marketing Association (AMA), a number of organizations still practice them.

Campaign Strategy

In the 2008 American presidential election, Democratic candidate—and now president—Barack Obama displayed the ability to learn from the past by altering the long-held, traditional advertising and get-out-the-vote (GOTV) strategies of the Democratic Party. After watching colleagues Al Gore and John Kerry fall to George W. Bush in 2000 and 2004, Obama opted to utilize new methods of communicating with voters through big-budget branding. Rather than focus on traditional strategies, Obama began working with new techniques that built more on Internet techniques similar to those that Howard Dean employed four years prior. However, the trend to move toward innovative campaigns with strong new media presences did not stop with the race for the presidency; instead, it has trickled down to the lowest-budget, local races.

Technology Gap

Referring back to the 2008 election, more than half of the voting-age population relied on the Internet as a political resource. While this number reflects the large societal impact of the Internet and implies future trends for electoral politics, it is important to take into consideration which demographics of the population were using the Internet as a resource. The data from the 2008 Pew Internet

and American Life Project reveal that, while most citizens were technologically engaged, a significant portion of senior citizens were not included. Of the 37 percent of senior citizens who actually used the Internet, 60 percent were considered political users. However, during the 2008 election, only 22 percent of the entire population of senior citizens in the United States was considered politically engaged online. Because senior citizens are typically a significant voting bloc during elections, the lack of technological involvement is revealing, particularly because the 2008 election has likely revolutionized how campaigns are organized.

While a technology gap unquestionably exists in the United States, much of the past research has focused on income and education as being two variables that lead to someone being connected or not. However, when looking at the impact of campaigns on participation and civic life, age is emerging as the dividing factor. Looking back at a discussion of new campaign techniques that have developed in recent years, one finds a significant discrepancy between younger and older citizens. First, the numbers related to social networking are staggering. According to research, 75 percent of citizens aged between 18 and 24 use social network sites, compared to 10 percent of those between 55 and 64 and only 7 percent of those over 65. When considering the utilization of text messages, statistics show that 85 percent of those

between 18 and 29 have sent or received a text message compared to only 11 percent of those over 65. Likewise, 28 percent of those between 18 and 29 have sent or received an e-mail, compared to only 6 percent of those over 65.

More directly, consider that 65 percent of voters between 18 and 29 said that they had watched some kind of campaign video online, and 59 percent said they had read a political blog, visited a candidate's Web site, or used a social networking site as a source of campaign information in 2008. Among those voters between 30 and 64 years old, however, only 38 percent said they had watched a campaign video online, and 38 percent said they had looked at a blog, Web site, or social networking site. Even more tellingly, only 17 percent of those over age 65 had seen an online video, and just over 10 percent had visited a blog or campaign Web site. The divide is clearly great.

It is expected that political campaigns will continue relying on technological advancements to organize and structure their messages. Technology has proven to be an attractive resource for campaigns as their ability to narrowcast increases when constituents self-select what they access online. In addition, the number of adult Americans who report the Internet as very important to their political decision making continues to increase, from 1996 onward. This has significant implications for how technology may be used in the future by political, and perhaps civic, organizations. As the youngest generation of voters is the most attached to the Internet and soft news sources for learning about campaigns, candidates are unlikely to abandon them in favor of the media of yesterday.

On the other hand, particularly at the state level, constituent demographics continue to be taken into consideration. For example, some scholars argue that, just as constituent demographics influence the home-style representation of an official, it also influences how campaign and political messages are relayed, what type of media is used, and how issues are framed. This research also indicates that those regions reporting large numbers of elderly constituents are less likely to rely solely on technology to broadcast messages.

When looking at elderly voters, scholarship has typically focused on voters over age 65. Within this group, however, it is important to note that

there are traceable differences between various subgroups. Boomers, the recently retired, and the older elderly all bring different political leanings to the table and likewise have different levels of familiarity with new media technologies. Because society continues to experience a gap in who has access to technology and who does not, it suffices to say that, in order to include as many segments of the population as possible in political life, the needs of each segment need to be taken into consideration. Old methods of engaging the population politically need not be abandoned for technological advancement. Past research has indicated a successful morphing of both new and old technology, accounting for the preferences of both the old and young. While the future of social capital in America remains unclear, it can be argued that its maintenance is contingent upon how successful campaigns are in understanding their targets and working with citizen preferences.

The 2008 Election and Internet Presence

In the age of ubiquitous computing, social networking tools saturate everyone's daily life. Campaigns are largely becoming decentralized, fueled in part by the development and advent of social networking. Having the ability to communicate in real time to anyone, anywhere, has become a major advantage when understood and utilized properly. The 2008 election proved to be the first in which social networking sites, and other forms of new media, ultimately became the medium and the message. What proves to be the best aspect for campaigns and candidates about the new technology is that it makes it incredibly easy to reach millions in milliseconds at little—if any—cost.

In 2000 and 2004, the Republican Party utilized multilevel marketing techniques to help spread news and aid George W. Bush on his path to the White House. However, their techniques, when viewed in comparison to the Obama campaign of 2008, can be considered primitive at best. Barack Obama is unquestionably the first Internet president—or perhaps wired president. He understands the Internet and the power of new technologies. Some go as far as to ask who the United States' first chief technology officer will be.

The Obama campaign ultimately took what people thought they knew about politics and turned it into a different game for a different generation.

He used the Internet in political ways that had never been thought of or conceived previously. His outside-the-box thinking and strategizing led to campaign ads appearing through text messages, Facebook wall posts, and video games. While John McCain admitted he did not use e-mail, Barack Obama successfully navigated the plethora of new media techniques on his way to the White House, where he became the first president to ask for a laptop computer to be put in the Oval Office.

The 2008 campaign proved to be a new era for the use of the Internet in political campaigns and marked the growing dominance of the medium as a political tool. The Obama campaign was successful in using the Internet to recruit and organize 1.5 million volunteers along with creating 8,000 online affinity groups and organizing 30,000 events. He succeeded in doing electronically what previously had to be done through shoe leather and phone banks: contact volunteers and donors, and schedule and promote events. The first successful step Obama took to developing a successful Web presence was beginning his Internet campaign by hiring two start-up college students, notably Chris Hughes, a founder of Facebook. Rather than attempting to strategize a plan from scratch, Obama recruited staffers who had hands-on experience with the activities he and his chief strategist, David Axelrod, felt were necessary to create the desired new media presence. With sites like YouTube, Facebook, and Myspace gaining popularity in 2006 as the new technology fads to affect campaigns, Obama immediately set out to have a strong, active presence on each. In short, Obama's Internet presence in the 2008 election helped do for the Internet what the 1960 election did for television: legitimize its role and demonstrate its potential.

The impact of this approach was clearly noted throughout—and after—the election. On Facebook, Obama had 2 million supporters, compared to 600,000 for McCain. Likewise, on Myspace, Obama had 844,927 friends, while McCain had barely more than 200,000. Beyond the social networking sites, Obama's Web site was largely considered far more dynamic than any of the others.

Whereas critics suggested that much of Hillary Clinton's Internet presence came off as disingenuous and lacking authenticity, Obama's campaign appeared to learn the lessons from earlier

campaigns: Web sites should be used to bring together a large number of small donors, to draw the faithful together, to understand the dynamics of Internet giving, and to understand who uses the Internet and how one can most easily reach them. The design of the Obama site made it as easy to donate as to do any type of impulse buying. Obama's site demonstrated that he loved people rather than someone like Clinton, whose site showed little besides her love for policy.

The importance of an Internet presence is unquestioned. Researchers found that the 2008 election marks the time when upstart Internet publications upstaged their print counterparts and became a crucial method of how voters get their political news. In this election cycle, campaigns used paid-search techniques to target online advertising and direct Internet users to their own online content. Likewise, others believe that campaign 2008 is likely to be remembered as the one in which the bloggers pushed aside the mainstream media. While such an assertion has not necessarily been proven, there is some remnant of truth in the idea that, for particular individuals, blogs and online content have surpassed traditional news media. However, as the discussion has emphasized, large proportions of the electorate still have little to no online engagement.

Aside from traditional Web sites, the Obama campaign was successful with its video presence on YouTube. Begin by considering the viral nature of Will.i.am's "Yes We Can" music video, which generated millions of hits in a short period of time. Obama's YouTube video channel contained more than 1,800 videos with approximately 19 million viewings. These numbers roughly outpace McCain four to one. Rather than depending on news coverage of events, the campaigns were able to take as much footage of any event they wished and post it, edited or unfiltered, for anyone to watch on the Internet. The news media was not necessary to reach the voters.

In another form of new media, the Obama campaign successfully utilized text messaging like no campaign before. Largely by choosing to first announce his vice president choice via text message, Obama was able to garner nearly 2 million individuals onto his text message list, which he would later use throughout the campaign to contact supporters about ways to get involved in

their local communities. This use has continued—including announcing the passage of health care reform via text in March 2010.

In an entirely new avenue of advertising, the Obama campaign began utilizing in-game advertising. Recognizing that the Playstation3 and Xbox360 both connect to live Internet feeds, Obama purchased advertising space in popular EA Sports titles, such as Madden NFL 09, NASCAR 09, NHL 09, NBA Live 09, and Burnout Paradise. Ads would appear throughout the games on scoreboards and billboards. The advertisements were targeted at eligible voters in key battleground states (mainly Colorado, Florida, Iowa, Indiana, Montana, North Carolina, New Mexico, Nevada, Ohio, and Wisconsin). All were considered to be swing states, and all had been won by Bush in 2004. The ad campaign ultimately cost just under \$45,000 and ran for roughly a month.

Barack Obama unquestionably had a budgetary advantage, yet John McCain failed to mount a challenge in regard to social networking on other types of free media. Obama had more friends on Facebook and Myspace, more viewers watched his YouTube channel, more subscribers were tweeting him to be president on Twitter, and he had thousands of more pictures uploaded to Flickr. Obama properly understood and integrated new media into his campaign. While he used Facebook to talk about his enjoyment of playing basketball and spending time with his daughters, Senator McCain used the space to talk about his love for fishing and his favorite movie, *Letters From Iwo Jima*. The branding effect—and ultimate targeting strategy—was clear.

The Youth Vote

The Millennial Generation—those born between 1978 and 1996—has historically not been viewed as politically active. The cycle that has led to lack of involvement normally follows this logic: Young voters do not vote or participate because politicians do to not involve them; politicians do not involve Millennials because they tend not to vote or participate. As Scoot Keeter explains, high-tech high touch is supposed to work with young voters. They are ethnically and racially diverse compared to older citizens. While many journalistic accounts of generations present in America (such

as the Millennials, Generation X, or the Baby Boomers) focus on overgeneralizations regarding their alleged characteristics, they can still be useful when framed appropriately as overviews of group behavior and traits.

The youth vote is unquestionably important with regard to representation. Young adults tend to be represented by politicians who are more likely to listen to the views of older citizens because they are more likely to vote. Further, it is important for political parties as they attempt to lock in young members into the future. With 82 million members, the generation has tremendous voting power and has been shown to choose to become engaged in public life when they have the motivation, opportunity, and the ability to do so. In this regard, one would expect to have seen voting increases in the 2008 election, given the attention Obama paid to making it as easy as possible for these voters to participate.

A young Barack Obama supporter at a rally on the Boston Common during the presidential primary campaign in October 2007. Youth voters voted for Obama by a two-to-one margin that year.

Youth voters, collectively, rose to meet expectations—turning out more than they had as a group since 1972 (the first year the voting age was lowered). Not only did they confirm popular suspicions by turning out, but they also overwhelmingly voted for Obama, by a two-to-one margin over Senator McCain. With roughly 23 million voters participating between the ages of 18 and 29, the 2008 election saw an increase of almost 2 million voters. Exit polls showed the role of youth voters in turning previously red states—particularly North Carolina and Indiana—blue. While overall turnout was up only modestly, young people provided much of that uptick.

Obama's candidacy became a national movement that lent itself to mass mobilization among that very portion of the population that is the most new-media friendly and tech savvy, the younger generation. They are black, white, yellow, and various shades of brown, but what they share—new media, online social networks, and a distaste for top-down sales pitches—connects them. In other words, the bond is based on the medium. They build relationships in communities that transcend cultural, temporal, and geographical boundaries, and membership in these communities provides for a civic engagement that is more connected than ever. And ultimately, once people are connected through a network, you cannot disconnect. It is like unbreaking an egg. While such journalistic explanations can oftentimes be overstated, one has yet to find evidence that suggests such assertions are not likely to be valid.

Conclusion

Clearly new technologies emerged in 2008. And, even more clearly—particularly in the general election—Barack Obama dominated in utilizing new technology. On the question of campaigns, Obama could communicate at almost no cost with any number of supporters to direct their influence throughout his election. Social networking and new media are cheap, efficient ways to reach particular voters while also allowing for detailed targeting. However, as the numbers suggest, such techniques do not reach older voters at a similarly high rate. For once, young voters are receiving attention that older voters are not. Whether this continues in 2012 or not is a question to be considered. YouTube is cheaper than

running television ads. Web sites are less expensive than billboards. As Daniel Shea and Michael John Burton point out, every position paper, every ad, every news release can be posted for all to see at minimal cost. Yet, a campaign that relies too heavily on technology risks alienating, or at the least not reaching, older voters. Given that older voters are historically more reliable, this is a risk for a candidate seeking election. Will candidates opt to emphasize a traditional campaign or a digitalized campaign, or will they be forced to run both campaigns now at a higher cost? Even though social networking and online videos are free to disseminate, as Obama showed through the hiring of Hughes, there is a cost to find the best workers and consultants in the field.

At the national level, it appears highly improbable that a candidate could succeed with only a tech-savvy, youth-oriented strategy. Such a campaign simply runs the risk of not reaching enough important voters. However, this is not to say that tech-savvy campaigns are not equally important to a candidate's success. Previous research by Chapman Rackaway suggests that statewide candidates in 2009 were operating at a campaign level roughly comparable to those of presidential candidates of 1996. Yet, many of the technologies Rackaway examined involved significant financial investments. With the Obama era of new media emerging with significantly smaller marginal costs, it is important to see how quickly local candidates begin attempting to utilize it. Obama was able to demonstrate the power of running two campaigns targeted at two different groups of citizens: a traditional, more expensive campaign based on television and radio ads and a secondary campaign based on technology and the Internet to reach the younger voters with lesser direct costs. If candidates wish to reach all voters, it appears that their best approach is to balance a tech-savvy, youth-oriented campaign with a more traditional one.

Candidates fail to realize the potentially negative effects that a new media campaign can have on their images. As we discussed earlier with regard to the Hillary Clinton campaign and the John McCain Facebook page, a disingenuous new media campaign can counteract the intentions of a candidate and actually make them appear out of touch. So far, it appears that personality and image play roles in the potential success of new media

campaigns. Obama came off as a youthful politician who ran a modern campaign. He understood the technology and how it could be best utilized; he did not merely choose to use it because he felt he was expected to. The 2008 campaign demonstrated what can happen when the right online tool merges with the right online dynamic. In short, it is better to steer clear of tools like Twitter or YouTube unless the campaign plans on regularly updating them and giving followers a reason to look at them. One tweet per month will come off as insincere and disinterested. And, even in the case of Obama, YouTube presented negative attributes as well. Consider that he was put on the defensive during the Democratic primary due to the release on YouTube of the inflammatory speeches of the Chicago pastor of his church, Jeremiah Wright.

There is no question that an online, new-media presence can work well to capture the attention of young voters at a significantly lower cost; however, relying on such tactics to supplant a traditional campaign at the state and local level is asking too much if a candidate is targeting their entire campaign at a younger demographic. As a consultant, the media attention given to Obama's successful use of Twitter, Facebook, text messaging, and YouTube posed serious problems when designing campaigns for smaller political actors. A new-media presence can activate voters who have never even considered the role of a township trustee, let alone voted for one. However, such activation simply does not assure victory. New media are simply not a less costly alternative to a traditional campaign. Rather, they are a new mechanism that alters ground campaigns for successful candidates by running in parallel to more traditional campaign approaches. It casts a net over voters who otherwise would have been untouched without sacrificing the traditional approach.

Campaigns, Congressional (2000)

The 2000 congressional elections, held in November, determined the composition of the 107th Congress. Before the elections, the 106th Congress had a Republican majority in both the House of Representatives and the Senate. The election coincided with the 2000 presidential election and resulted in a brief period of unified government under Republican control. As a result of the election, Texas Governor George W. Bush controlled the White House; in addition, Republicans maintained control of the House. The Senate, however, was evenly divided, with each party controlling 50 seats; this necessitated a tie-breaking vote by Vice President Dick Cheney.

Congress Before the 2000 Election

In the previous congressional elections, held in 1998, the Republicans maintained control of both chambers, despite losing five seats in the House. In the Senate, they controlled 55 seats, and the

Democrats controlled 45 seats. In the House, the Republican Party controlled 223 seats; the Democrats controlled 211 seats, and one seat was held by an independent.

Mississippi's Trent Lott served as Senate majority leader, and Tom Daschle, from South Dakota, was the Senate minority leader. In the House, Speaker Newt Gingrich of Georgia led the Republicans, and Missouri's Dick Gephardt led the Democrats. In addition, in mid-2000, Democrats gained an additional Senate seat, following the death of Paul Coverdell, a Republican from Georgia. At this point, Georgia Governor Roy Barnes appointed fellow Democrat, Zell Miller, to the seat. In the special election held in November 2000, Miller won the seat in his own right.

In the run-up to the 2000 election, approval of Congress had ticked up slightly, buoying Republican hopes of retaining control. In 1999, a Gallup poll found that Congress had a job approval rating of 37 percent, with 56 percent of respondents expressing disapproval. By October 2000, however, congressional job approval rose to 49 percent, while the disapproval rating dropped to 42 percent.

Competitive Seats

Data from the Cook Political Report indicated that only 47 of the 435 House seats up for election could be considered competitive races. This represented a decline from the 58 competitive seats in the 1998 election and was sharply contrasted with elections in 1992, 1994, and 1996, all of which boasted more than 100 competitive seats.

On the Senate side, of the 33 races in the cycle, 24 seats were held by Republican incumbents, and nine seats were held by Democratic incumbents; of those, only four races were for open seats. Moreover, only a small number of these races were considered competitive. Democrats focused on vulnerable Republican seats in Delaware, Florida, Michigan, Minnesota, Missouri, Montana, Pennsylvania, and Washington. Republicans focused their energies on trying to pick up vulnerable Democratic seats in Nebraska, Nevada, and New York.

Campaign Spending

Overall, the 2000 election cost more than any other previous election. Because of the narrow

margins in both the House and the Senate, both the national parties and outside interest groups focused intensely on winning the comparatively few competitive races. In a sample of 12 competitive congressional races, David Magleby found that parties and interest groups outspent the candidate by a margin of two to one.

One notable trend in this cycle was the record-setting sums of soft money raised and spent by both parties. Democrats, who had in the past lagged behind the Republicans, achieved near parity in this election cycle. Specifically, Democrats raised \$243 million, and the Republicans raised \$244 million. This was particularly significant for Senate Democrats; the Democratic Senatorial Campaign Committee (DSCC) raised \$63 million; in contrast, in 1994, the DSCC had raised a paltry \$372,000 of soft money.

There was also an increase in hard money during this round of congressional elections; although both parties increased their fund-raising from the 1998 election cycle, the Republicans still maintained a significant advantage in this area. In the 2000 election cycle, Democrats raised almost \$270 million in hard money, while Republicans raised more than \$447 million.

Another trend was a sharp increase in outside contributions, with many groups doubling the amount they had spent in the previous cycle. On the Democratic side, the American Federation of Labor-Congress of Industrial Organizations (AFL-CIO), National Education Association (NEA), Sierra Club, and League of Conservation Voters (LCV) all stepped up their campaign activities. On the Republican side, both the National Rifle Association (NRA) and the National Federation of Independent Business (NFIB) sharply increased election-related spending. During the 2000 election season, interest groups collectively spent more than \$260 million, one-fifth of what the national parties spent.

Issues in the Election

Although the congressional election coincided with a close presidential race between Texas Governor George W. Bush and Vice President Al Gore, neither party promoted a national campaign agenda, preferring to let candidates focus on district- or state-level issues. Although congressional Democrats had hoped to capitalize on

the continuing unpopularity of the Republican-initiated impeachment proceedings against Bill Clinton, Republican candidates responded by deemphasizing their party affiliation in election advertisements and direct mail and instead trumpeted the resources they had secured for their constituents.

Overall, pre-election polls demonstrated that no single issue captured the attention of voters. In one Gallup poll, 17 percent of voters indicated that education was their top concern, while another 12 percent stated that they were most concerned with ethics, morality, and family decline. Combined economic problems were the top concern of 21 percent of respondents, while another 11 percent stated that health care was their top concern.

During the campaign, both political parties and interest groups mobilized voters by focusing on an array of social and economic issues. Television advertising focused on abortion and health care, while direct mail advertisements tended to emphasize issues such as education, gun control, and Social Security.

Technology and the 2000 Election

Although Internet usage was growing at this time, the 2000 election did not feature the use of Internet technology and social media to the degree that those technologies have shaped, and sometimes dominated, subsequent elections. However, both of the presidential candidates had Web sites in 2000; many congressional candidates, in contrast, did not. State party Web sites did exist, although many of them simply served as a source of news about the election, and were not used to organize campaigns or as integral components of campaign strategies. Perhaps the most significant use of the Internet in the 2000 election, however, was in the area of online fund-raising, since 2000 was the year in which presidential candidate John McCain (R-Arizona) broke all previous records by using the Internet to raise \$2.7 million in only three days.

During the election cycle, 54 million U.S. households, approximately 51 percent of the population, had a home computer. Although this was a 9 percent increase from 1998, only 42 percent of those with a computer used the Internet at home. In line with this, a study by Thomas P.

Boyle found that only 18 percent of the population reported using the Internet to receive news and information about the election. Those most likely to use the Internet for political information were individuals in the 18 to 25 age group, with 85 percent of these respondents indicating that they had some form of exposure to online political information. In contrast, only 11 percent of voters 66 and over used the Internet to obtain political information.

Both political parties did use e-mail communication during the campaign, although usage was limited. Specifically, the Democratic Party created only four unique e-mails, and the Republican Party produced only two. According to the Pew Research Center, in total, only 12 unique e-mails were produced during the 2000 campaign by both parties and outside interest groups. During this cycle, the dominant method used to communicate with voters continued to be traditional direct mail.

Notable Races

During the 2000 election cycle, several Senate races garnered national attention. In New York, in the race for the Senate seat vacated by Democrat Daniel Patrick Moynihan, First Lady Hillary Clinton ran against Republican Congressman Rick Lazio. Lazio vastly outspent Clinton; he spent \$40 million, compared to Clinton's \$29 million. Despite this disparity in funding, Clinton won the seat, securing 55 percent of the vote, compared to Lazio's 43 percent.

In Montana, a tragedy upended a close Senate race that featured Democratic Governor Mel Carnahan challenging incumbent Republican John Ashcroft. In mid-October, Carnahan was killed in a plane crash; because election law prevented Carnahan's name from being removed from the ballot so close to Election Day, his widow, Jean Carnahan, pledged to serve if her husband won. Carnahan won the close election, with 50.5 percent of the vote, compared to Ashcroft's 48.4 percent; this made him the first person to be elected to the Senate posthumously.

Finally, the race for the open Senate seat in New Jersey was noteworthy for the high sums spent by the Democratic candidate, Jon Corzine. Corzine, a former chief executive officer (CEO) of Goldman Sachs, spent a record-setting \$35

New Jersey Senate candidate Jon Corzine set a record for personal money spent in his bid to win the Democratic primary—\$35 million—twice the previous record. His efforts were rewarded when he won 50 percent of the vote in 2000.

million of his own money to win the Democratic primary. In the general election, he spent another \$60 million, nearly doubling the record for candidate spending on a Senate race. He defeated his Republican challenger, Congressman Bob Franks, winning 50 percent of the vote to Franks's 47 percent.

Results and Subsequent Developments

The election resulted in unified government under Republican control. The outcome of the 2000 congressional election was a 50–50 split in the Senate and a small Republican majority in the House of Representatives. The House was composed of 221 Republican seats, 212 Democratic seats, and two independents. Most of the House races were generally not competitive, with candidates winning

approximately 77 percent of the races by a margin of at least 20 percent. In addition, within districts, there was general congruence between the results of the presidential race and the congressional race. Specifically, congressional Democrats won 81 percent of the districts that Gore won, and congressional Republicans won 80 percent of the districts that Bush won.

Despite the Republican victory, Democrats did succeed in shrinking the Republican majority. In the Senate, Democrats defeated five Republican incumbents: Delaware's Bill Roth, Michigan's Spencer Abraham, Minnesota's Rod Grams, Missouri's John Ashcroft, and Washington's Slade Gorton. In contrast, only one Democratic incumbent, Virginia's Chuck Robb, lost his seat. In the House, the Republicans lost two seats; one was a pickup by Democrats, while the other was won by an independent. This reduced their majority to nine seats, and this constituted the third straight election in which Democrats chipped away at the Republican majority in the House.

The Republican control of Congress was short-lived, however. In May 2001, Senator Jim Jeffords, a Republican from Vermont, switched his party affiliation, becoming an independent and caucusing with Democrats. This shifted control of the Senate to the Democrats, with Tom Daschle assuming the role of majority leader.

Campaigns, Congressional (2002)

The 2002 congressional elections, held in November, determined the composition of the 108th Congress. Before the elections, the 107th Congress was composed of a Republican majority in the House, with Democrats narrowly controlling the Senate. The election occurred 14 months after the terrorist attacks of September 11, 2001, ensuring that national security issues would factor prominently in the campaign. Buoyed by the popularity of Republican President George W. Bush, as well as a favorable round of redistricting and reapportionment, Republicans maintained control of the House, and regained control of the Senate.

Congress Before the 2002 Election

The previous congressional elections, held in 2000, had resulted in a brief period of unified government under Republican control. Specifically, the outcome of the 2000 congressional elections was a 50–50 split in the Senate and a small Republican majority in the House of Representatives. In the Senate, Mississippi's Trent Lott was the majority leader, and North Dakota's Tom Daschle was the minority leader. In the House, Dennis Hastert of Illinois served as speaker, and Dick Gephardt of Missouri was minority leader.

Republican control of Congress, however, was short-lived. In May of 2001, Senator Jim Jeffords, a Republican from Vermont, switched his party affiliation, becoming an independent and caucusing with the Democrats. His departure from the Republican Party gave Democrats control of the Senate. In the run-up to the 2002 election, President Bush made clear that one of his key goals was to rally support for Republican candidates in order for his party to regain control of the Senate.

In a Gallup poll taken in October of 2002, the public appeared satisfied with Congress's performance. Specifically, 50 percent of respondents indicated that they approved of Congress, while 40 percent expressed disapproval; the remaining 10 percent had no opinion. Notably, this represented a higher approval rating than Congress had enjoyed before any of the three previous midterm elections.

Redistricting and Competitive Seats

As a result of the 2000 Census, states participated in redistricting; this had the potential to alter the composition of many congressional districts. Overall, the new map favored the Republicans, with House seats being reapportioned from Democratic areas in the Northeast to Republican areas in the South. According to James E. Campbell, if the 2000 election had been conducted with the new districts in place, George W. Bush would have won an additional 10 districts.

The result of redistricting was a map with 236 Republican-leaning districts and 199 Democratic-leaning districts. Prior to the election, it was estimated that there would be 178 safe Republican seats and 154 safe Democratic seats. According to an analysis by *Congressional Quarterly*, in the 2002 election, there were only 48 districts with toss-up races. In addition, of the 34 Senate seats up for election in this cycle, 20 were Republican-held seats and 14 were Democrat-held seats. *Congressional Quarterly* judged only 13 of these races to be competitive.

Campaign Spending

In the 2002 election cycle, Democrats raised more soft money than Republicans, overcoming what had been a traditional disadvantage. Specifically, the Democratic Senatorial Campaign Committee (DSCC) raised \$95 million, and the Democratic Congressional Campaign Committee (DCCC) raised \$56 million. In contrast, the National Republican Senatorial Committee (NRSC) raised \$66 million, and the National Republican Congressional Committee (NRCC) raised \$70 million.

The Republicans, however, continued to enjoy their traditional advantage in hard money. In the 2002 election cycle, Republicans raised \$400 million, compared to the \$220 million raised by Democrats. Although this was a lower level of spending than in the 2000 election, it was a record-setting amount for a midterm election cycle.

Outside interest group spending declined from the 2000 election cycle, especially on the Democratic side. Groups that traditionally supported Democrats, including Planned Parenthood, Sierra Club, and the National Association for the Advancement of Colored People (NAACP), all spent less on this election. In contrast, two key Republican-leaning groups, the Club For

Growth and the National Federation of Independent Business, increased their spending from 2000 levels.

In accordance with this, in 2002, party spending on the ground game surpassed the spending of outside interest groups. Republicans made a particular effort in this area, with House Republicans launching the Strategic Taskforce to Organize and Mobilize People (STOMP); STOMP dispatched Republican luminaries to competitive races in order to raise money, recruit volunteers, and mobilize Republican voters.

Issues in the Election

The 2002 election cycle was the first election after the terrorist attacks of September 11, 2001, when Islamist extremists hijacked four commercial planes, with three planes crashing into the Pentagon and the Twin Towers in New York City; the fourth plane was diverted by passengers and crashed in rural Pennsylvania. Nearly 3,000 Americans and many international citizens who were working in New York's financial district were killed in the attacks.

One of the most notable effects of the terrorist attacks was a spike in the popularity of the president. Before the attacks, the president's approval rating stood at 51 percent; immediately after the attacks, however, Bush's approval rating jumped to 90 percent. Although his approval rating dropped from these stratospheric levels, in the run-up to the 2002 election Bush remained enormously popular, enjoying a 63 percent approval rating.

Capitalizing on his popularity, Bush helped campaign for Republicans in competitive races. During the election, he made a total of 108 campaign stops for 46 Republican candidates for the House and Senate. He visited Missouri seven times and South Dakota and Minnesota five times each. David Magleby and J. Quin Monson estimate that, during these visits, the president helped raise \$140 million for Republican candidates. Vice President Dick Cheney, First Lady Laura Bush, and former Republican Mayor of New York Rudy Giuliani also made visits on behalf of Republican candidates.

A pre-election Gallup poll confirmed that national security issues loomed large for voters. In the poll, 83 percent of respondents stated that terrorism was "very important" or "extremely

important" in their voting decision. Furthermore, on this issue, Republicans held a 29-point advantage over Democrats, with 57 percent of respondents stating that Republicans could best handle the issue of terrorism and national security, compared to only 27 percent who adjudged Democrats to be superior on this issue.

Although terrorism was the dominant issue in the campaign, candidates also focused on a variety of domestic issues. On the Republican side, both the candidates and the national party focused on taxation; tax issues were the most frequent topic of mailers and campaign commercials. Another common theme for Republicans was prescription drug benefits for seniors. Specifically, the party trumpeted the House's success in passing a prescription drug bill that had stalled in the Democrat-controlled Senate. In contrast, Social Security was the most prominent issue in communications from Democratic candidates; direct mail and television commercials focused on the specter of a Republican plan to privatize the program. Direct mail communications from the Democratic Party focused mainly on prescription drug benefits and education issues.

Technology and the 2002 Election

Although Internet usage had increased between 2000 and 2002, in this election cycle few Americans sought election information online. A study by the Pew Research Center found that only 22 percent of Internet users searched online for election information; this was up from 15 percent in the previous election cycle. Of those users, 79 percent reported that they sought specific information on the positions of a political candidate, a jump from 69 percent in 2000. Overall, however, only 11 percent of users said the Internet was their main source for political information. Television remained the dominant source of political information for most voters.

Notable Races

During this election cycle, both national parties and interest groups focused intensely on a small number of competitive races, especially in the Senate. One such race was in Minnesota. The tight race between Democratic incumbent Paul Wellstone and Republican Norm Coleman, the mayor of Saint Paul, was marred by tragedy when

Wellstone was killed in a plane crash in late October. The party chose Walter Mondale, former vice president and 1984 Democratic presidential candidate, as his replacement. The NRSC spent \$8.3 million on the race, while the DSCC spent \$7.5 million. Coleman went on to win the election, garnering nearly 50 percent of the vote, compared to Mondale's 47 percent.

Another costly Senate race occurred in South Dakota, between Democratic incumbent Tim Johnson and Republican Congressman John Thune. The DSCC transferred \$4.5 million in soft money and \$1.4 million in hard money to the race; similarly, the NRSC transferred \$3.5 million in soft money and \$900,000 dollars in hard money to South Dakota Republicans. Including expenditures by interest groups, a total of \$24 million was spent on the race, making it the most expensive in U.S. history. Johnson won the election, narrowly maintaining his seat by a margin of just 524 votes.

Results and Subsequent Developments

The 2002 midterm elections resulted in Republican control of both the Senate and House of Representatives. In the Senate, Republicans held 51 seats, the Democrats held 48 seats, and one seat was held by an independent. In the House, the Republicans controlled 229 seats, while the Democrats controlled 205.

The election represented a strong showing for the Republican Party and testified to the popularity of President Bush; Republicans bucked the historical pattern that the party in the White House would experience midterm loses. Specifically, Republicans enjoyed a net gain of two Senate seats and eight House seats. In the Senate, Republicans successfully won three seats held by Democratic incumbents in Georgia, Missouri, and Minnesota. The only Democratic pickup in the Senate was in Arkansas, where the incumbent Republican was plagued by a personal scandal.

Overall, turnout for the election was 29 percent, slightly below the turnout in the 1998 midterm elections. Some states with competitive races saw much higher numbers. For example, the highest turnout occurred in Minnesota and South Dakota, with 61 percent turnout in those states.

The competition during this election cycle was particularly low. The average margin of victory

for winning candidates was nearly 40 percent. In addition, challengers only succeeded in defeating four incumbents; this occurrence was a historical low. This put the re-election rate at 79 percent for the Senate and 98 percent for the House.

Campaigns, Congressional (2004)

The 2004 congressional elections, held on November 2, determined the composition of the 109th Congress. The elections, which occurred at the same time as a closely contested presidential election, resulted in Republicans maintaining control of both houses of Congress. A central issue in the campaigns was the partisan polarization surrounding the George W. Bush presidency. In addition, this election marked a large increase in Internet activity by both campaigns and voters.

Congress Before the Election

In the previous congressional elections, held in 2002, the Republicans maintained control of the House of Representatives and gained control of the Senate. In the wake of the September 11, 2001, terrorist bombings, under the leadership of President George W. Bush, Republicans were able to buck the historical trend whereby the party holding the White House traditionally loses seats in the midterm elections. In the 108th Congress, Republicans controlled 229 seats in the House and Democrats controlled 204 seats; one seat was held by an independent. In the Senate, 51 seats were controlled by Republicans, 48 by Democrats, and one by an independent. Dennis Hastert from Illinois was the Speaker of the House and California's Nancy Pelosi was minority leader. In the Senate, Tennessee's Bill Frist was majority leader and South Dakota's Tom Daschle was minority leader.

Prior to the elections, polls showed public dissatisfaction with Congress. In a Gallup poll in late June 2004, only 41 percent of respondents indicated they approved of Congress's job performance and 52 percent expressed disapproval. This poll, however, showed that Democrats and Republicans diverged in their assessment of Congress. Specifically, 58 percent of Republicans approved of the job Congress was doing, compared to only 28 percent of Democrats and 39 percent of independents.

Level of Competitiveness in House and Senate Races

Although the presidential race between President Bush and Massachusetts Senator John Kerry remained close throughout the campaign, several factors made it unlikely that the Democratic Party would gain control of Congress. In the Senate, the Democrats were defending 19 seats, 10 of which were in states that Bush carried in 2000. In contrast, Republicans were defending only 15 seats; all but three of those races were in states Bush had carried in 2000.

The situation in the House was similarly unfavorable for a Democratic takeover. The redistricting from the 2000 census had reduced the number of competitive seats, and prior to the election, *Congressional Quarterly* identified only 37 House seats as competitive; this was down from

47 competitive seats in 2002. Moreover, in 2003, after gaining control of the Texas legislature, state Republicans engaged in a second round of redistricting, altering the boundaries of several congressional districts with Democratic incumbents.

Campaign Finance Reform

The 2004 election was the first election in which parties and candidates were subject to the regulations of the Bipartisan Campaign Reform Act of 2002 (BCRA), often referred to as the McCain-Feingold Act. The BCRA contained various provisions designed to make the funding of elections more transparent; this included the elimination of the soft money loophole, which had allowed individuals to give unlimited money to political parties for party-building activities or issue advertising. In addition, the act doubled the limit for individual contributions to a candidate, raising it to \$2,000; it also increased the amount an individual could donate to a party, from \$20,000 to \$25,000.

The BCRA contained a "stand by your ad" provision, which required parties and candidates to identify sponsorship of political ads. Although these rules applied to television advertising and direct mailing, at the time of the 2004 elections, the Federal Election Commission exempted most digital communications from regulation. Specifically, mass e-mail and text messages were not subject to disclosure requirements.

In this cycle, the BCRA did little to arrest the increasing costs of congressional campaigns. According to OpenSecrets.org, in 2004, the average winner in a House race spent \$1 million, while the average winner in a Senate race spent \$7.8 million. In contrast, in 2002, the average House winner spent \$898,000 and the average Senate winner spent \$5.3 million.

Issues in the Election

No single national issue dominated the 2004 congressional campaigns. This was demonstrated by a Gallup poll taken in mid-October 2004; when asked what they considered to be the most important issue in the 2004 election, 32 percent of respondents said the economy, 29 percent said terrorism, 22 percent said Iraq, and 15 percent said health care. Additionally, Democrats and Republicans indicated that different issues motivated

their electoral choices; Democrats were most concerned about domestic issues, such as the economy and Social Security, while Republicans rated terrorism and moral issues as most important.

Another issue separating the voters was attitudes toward President George W. Bush; in the month before the election, Gallup found highly polarized attitudes regarding his administration's performance. Specifically, 71 percent of Republicans strongly approved of incumbent Bush, while 68 percent of Democrats strongly disapproved of him.

Because of this polarization, in close races the national parties focused on increasing the turnout of their bases. The Republican National Committee (RNC) developed a 72-hour task force, which used databases to pinpoint likely Republican voters before Election Day. On the Democratic side, more than 30 groups, including EMILY's List and the Sierra Club, worked under the umbrella of America Votes to contact and turn out likely Democratic voters. In addition, in competitive congressional races in this cycle, an average of 21.7 interest groups participated in voter mobilization.

The Internet and the 2004 Election

During the preceding years, Internet use had grown rapidly, and by 2004, 61 percent of the adult population was online. In accordance with this, prior to Election Day, many voters used the Internet to research candidates and issues. A survey conducted by the Pew Research Center found that 31 percent of Americans got at least some of their election news online, and 18 percent of the public used the Internet as their primary source for news; this was up from 11 percent in 2000. In addition, Pew found that Americans reported using the Internet for a wide variety of political activities; among Internet users, 52 percent of adults went online to get political news or go to chat rooms, 35 percent used e-mail to discuss politics, and 11 percent used the Web to volunteer or donate money to a campaign.

When seeking online news, citizens tended to gravitate toward traditional, established outlets, with 43 percent reporting that they obtained news from sites like CNN.com and the online version of the *New York Times*. An additional 28 percent reported that they relied on service providers such as America Online (AOL) or the Microsoft

Network (MSN) for election news. Notably, 33 percent of those who sought news online indicated they felt that traditional news sources did not provide enough information about political issues and candidates' positions.

In addition, for the first time, Web sites became a standard feature of congressional campaigns, and in 2004 all 68 Senate candidates maintained a personal Web site. Notably, in addition to providing information about the candidate, campaigns used these sites to encourage voting; 63 percent of candidate Web sites provided information about voter registration, and 32 provided information about obtaining an absentee ballot. This was a sharp jump from 2000, when only one-quarter of Senate Web sites provided any information about voting opportunities.

Another frequent feature on the Senate sites was a function that allowed visitors to customize an e-mail letter extolling the candidate and then send it to friends and family; this was available on 28 sites. Another 22 sites provided a template for e-mailing a letter to a newspaper.

In addition, in this cycle many congressional campaigns began using e-mail as part of a voter outreach strategy; however, it was still used less than other traditional forms of campaign communication. Specifically, in competitive states, 15.2 percent of voters reported receiving e-mail communications from a campaign; in contrast, 69 percent of voters received phone calls and 72 percent received mailers.

The national committees for both parties also invested in online advertising, with the RNC spending \$487 million and the DNC spending \$257 million. Most of these funds, however, were devoted to advertising for presidential rather than congressional candidates.

Notable Races

In 2004, two Senate candidates made an online strategy the centerpiece of their campaigns. In Florida, Democratic candidate Betty Castor hired Larry Biddle as her deputy campaign manager; he was a veteran of the of Howard Dean campaign. In the Democratic primary, Castor initially lagged behind her better-funded opponents; her campaign rebounded after she launched a fundraising Web site modeled after Dean's. She managed to raise \$1.5 million in the second quarter of

2004 and collected \$40,000 in one six-day fundraising haul.

After winning the primary, Castor continued to use an online strategy in the general election campaign against Republican Mel Martinez, secretary of Housing and Urban Development in the Bush administration. This included her Web site, BettyNet.com; the campaign used the site to communicate with and coordinate volunteers, dubbed "Betty Heads." In addition, her campaign followed Dean's in using Meetup.com to encourage supporters throughout Florida to gather in small groups to campaign on behalf of Castor. Despite her efforts to generate support online, Castor lost the election by one percentage point.

The Internet also featured prominently in the North Carolina Senate race for the open seat vacated by Democratic vice presidential nominee John Edwards. Like Castor, Democratic candidate Erskine Bowles hired an Internet strategist. A key component of his online effort was fundraising; he raised \$500,000 online, with many of the donations in amounts of around \$100. In addition, three months before the election, his campaign developed a blog, named "Blog for Bowles," to provide details on the candidate's activities; in response, his Republican opponent, Richard Burr, developed his own blog, named "Blogg4Burr." Bowles also communicated with a list of 100,000 supporters via e-mail and advertised extensively online, placing ads on three North Carolina news sites, as well as on Google. Bowles eventually lost the election to Burr, by a margin of 52 to 47 percent.

Another notable race occurred in Illinois to replace the retiring Republican incumbent. State senator and future president Barack Obama initially faced Republican investment banker Jack Ryan. A personal scandal forced Ryan to abruptly withdraw from the race, and Allan Keyes, a conservative activist, replaced him. As a result, this was the first Senate election in which both candidates were African Americans. During the campaign, Obama used his online presence to cultivate a national profile; during his keynote speech at the 2004 Democratic National Convention, his Web site received 250 hits per second. Obama eventually won the race by a 43-point margin.

The most expensive Senate race in this election occurred in South Dakota, where Republican

John Thune challenged Senate minority leader and three-term incumbent Tom Daschle. Thune, who had lost the 2002 Senate election by a little more than 500 votes, received strong support from national Republicans, who argued that Daschle was obstructing Bush's agenda. The overall cost of the race was more than \$30 million; this averaged approximately \$67 spent per registered voter. Thune won the election by a margin of 51 to 49 percent; this marked the first time since 1956 that a Senate party leader was defeated.

Election Outcome

The election resulted in continued Republican control of Congress, with Republicans strengthening their majorities in both chambers. In the Senate, eight seats switched parties, resulting in a net gain of four seats for Republicans. Specifically, the Republicans picked up open seats in Georgia, South Carolina, North Carolina, Florida, and Louisiana and defeated the incumbent Democrat in South Dakota. The Democrats picked up open seats in Illinois and Colorado. In the House, 13 seats changed parties, resulting in a net gain of three seats for Republicans. Specifically, Democrats won seats in Colorado, South Dakota, New York, Georgia, and Illinois. The Republicans won seats in Kentucky and Indiana and also defeated several Democratic incumbents in Texas, as well as winning a newly created district in the state.

Overall turnout was 60 percent of the electorate; this was a 5 percent increase from 2000. Republicans, however, enjoyed a turnout advantage; in House elections, Republicans had an 8.7 percent turnout advantage and enjoyed a 9.6 percent turnout advantage in Senate races. Overall, voters displayed strong party loyalty, with districts voting for a presidential and congressional candidate from the same party more than 80 percent of the time. In the House the incumbent re-election rate was 98 percent, and in the Senate it was 96 percent; this led one scholar to deem the election the least competitive in the postwar era.

Campaigns, Congressional (2006)

The congressional elections in 2006 occurred midway through the second term of George W. Bush's presidency. In this election the Democratic Party picked up seats in both the U.S. House of Representatives and the U.S. Senate. In addition, the Democratic Party saw an electoral advance in the number of governorships held by the Democratic Party. These gains resulted in a shift in the partisan balance of power in Congress as Democrats became the majority party in both the House and the Senate. A summary of the election night returns and a brief explanation for the success of the Democratic Party is noted below.

Beginning with the House of Representatives, according to publicized election returns, Democrats gained 30 seats at the end of the electoral process, resulting in the party controlling 233 of the 435 seats. This became a newsworthy event because the Republican Party had been the party in power in the U.S. House for the previous 12 years, following their substantial seat gains in the 1994 midterm election. Subsequently, in the U.S. Senate, according to publicized election returns, the Democrats gained six seats, barely edging out the Republican Party for majority status, holding 51 of the 100 total seats. This 51 to 49 margin was achieved as a result of two Independent members, Joseph Lieberman and Bernie Sanders, declaring that they would caucus with the Democratic Party. Finally, according to

publicized election returns, of those states holding gubernatorial elections in 2006, Democrats were able to gain six governorships, increasing the number of governors affiliated with the Democratic Party from 22 to 28. This included wins in Massachusetts, New York, and Ohio, formerly strongholds for Republican governors through much of the 1990s and early into the 21st century. The election was also notable because the turnover in partisan control led to Nancy Pelosi becoming the first female speaker of the House of Representatives.

Although there are a variety of explanations for this partisan swing, many experts contend that two central factors were dissatisfaction with the country's involvement in the Iraq War, and job approval ratings below 50 percent for President Bush. In addition, the Republican Party was hampered by a series of scandals that hurt the confidence of some voters in the Republican Party and culminated in lost seats. For example, Mark Foley resigned from Congress in September 2006 after the news media reported that he had sent sexual messages to underage male members of the congressional page program. The Republican leadership also became embroiled in the scandal when the House Ethics Committee reported that members of the leadership had been aware of Foley's behavior prior to the media revelations.

Social media technology has been harnessed in political campaigns with increasing fervor since around the beginning of the 21st century. Although much of this technology seems commonplace today, many social networking sites had only just come into existence during the 2006 election. The following sections address how candidates have used the technology in their campaigns, some of the risks and rewards of expanding social media usage, and the manner of media usage by citizens in 2006.

Online Fund-Raising

Modern campaigns tend to blend old media (e.g., radio, television, and direct mail) with forms of new media (e.g., Web sites, blogs, Twitter, and Facebook). As more citizens have become familiar with forms of new media and as some candidates have learned to utilize social media successfully, others have followed suit. One of the earliest forays into social media at the federal level

occurred when Senator John McCain attempted to capture the Republican presidential nomination in 2000. McCain utilized the Web to help him raise money for his campaign and collected over \$2 million in a matter of days. Although George W. Bush ultimately won the Republican Party nomination, subsequent candidates followed in McCain's footsteps and far surpassed his online fund-raising.

Particular to the midterm elections in 2006, the Pew Research Center projected that MoveOn.org, a political advocacy group, was able to use the Internet to raise over \$20 million in 2006. In doing so, online fund-raising became a technique used by groups as well as a platform for candidates to raise small contributions quickly. Nevertheless, Web-based fund-raising in 2006 still made up a relatively small portion of total campaign funds, with estimates at \$100 million. Furthermore, most of the money collected online was still being devoted to more traditional forms of media advertising, such as television spots. Scholarly estimates placed online advertising at \$40 million. It was not until 2008 that Democratic presidential hopeful Barack Obama showed the tremendous potential of online fund-raising as he raised approximately \$500 million through the Web. The typical donor made a small contribution to the Obama campaign and made multiple donations over the course of the campaign. Thus, online fund-raising has provided a convenient way for citizens to invest in campaigns and for candidates to collect funds and information on supporters. Nevertheless, large donors are still more prevalent in campaigns and many citizens still do not contribute to political campaigns.

Political Campaign Web Sites and Social Networking

Besides online fund-raising through campaign Web sites, candidates began to use social networking platforms like Meetup.com and Facebook to connect with interested citizens and supporters. Friendster was one of the earliest social networking Web sites and burst onto the scene in the United States in 2002. The introduction of Friendster was rapidly followed by other social networking Web sites, including MySpace and LinkedIn in 2003, Facebook in 2004, and Twitter in 2006. These Web sites are beneficial to

campaigns because they are an inexpensive way to reach and organize potential voters and interested supporters. They also provide a way for citizens to follow campaign news and candidate announcements with relative ease and to advertise their civic engagement to friends and family. However, they are not without risks, as candidates may have to contend with public postings of negative feedback and criticism of their pages.

In one of the earliest attempts to use social networking, Howard Dean used the Web site Meetup.com to enlist supporters in his bid for the Democratic presidential nomination in 2004. Dean showed the potential of these platforms when he collected almost 188,000 supporters very early in the presidential primary process. Savvy congressional candidates in 2006 took notice and most worked to create a presence online. By 2006, according to one Web-based scholarly study, about four-fifths of House candidates and approximately 85 percent of Senate candidates had a political Web site. However, in 2006, the use of political Web sites by independent and third-party candidates still lagged behind that of major-party candidates. In addition, numerous scholarly studies have found that better-financed candidates, candidates engaged in competitive campaigns, and young candidates were more likely to have Web sites compared to their counterparts.

According to an analysis of congressional campaign Web sites in 2006 conducted by Girish Gulati and Christine Williams, two faculty members at Bentley College, U.S. House and Senate candidates focus on a number of criteria. In particular, candidate Web sites tend to state their positions on a variety of campaign issues, their e-mail address, news about their campaign, and a biographical sketch of the candidate. In addition, by 2006, candidates were becoming more savvy in using personal campaign Web sites to solicit campaign funds and to recruit volunteers. However, political Web sites in 2006 lagged behind modern campaign Web sites in their use of audio and video content and in posting candidate appearances, etc. In the years since 2006, campaigns have become much more adept at merging campaign information with media content. Today, presidential campaign Web sites link to separate YouTube pages chock-full of videos

about the candidate as well as profiles on Facebook, Twitter, and Tumblr.

Although modern federal-level campaigns are more likely to utilize Facebook today compared to 2006, Facebook was used during the midterm congressional elections in 2006. According to a study of Facebook profiles and pages in 2006 and 2008 conducted by Gulati and Williams, less than 20 percent of U.S. House candidates from the Democratic and Republican parties personalized their Facebook profiles in 2006. However, just two years later, 72 percent of candidates had a Facebook presence and about half of these individuals opted to customize their pages. Gulati and Williams also concluded that incumbents, Republican candidates, poorly financed candidates, and candidates with weak opposition or no opposition were less likely to update their Facebook information.

Besides the rate of candidate usage, the manner in which candidates could customize their sites also changed over time. In 2006, congressional and gubernatorial political candidates could utilize a specific location on their network to create profiles. The social networking site sent passwords for the profile pages to the Republican and Democratic national committees to distribute to the individual candidates. The candidates could then add information to their pages, and friends of the profile could post on the profile page. After this trial run in 2006, Facebook modified its treatment of political candidates for the 2008 election. Candidates were given pages instead of profiles and all pages were located in a special subsection of pages for politicians. Thus, politicians were organized in the same fashion as athletic teams and film stars and had more capability to personalize their page with photos and videos.

YouTube

Besides Facebook, another technology that was novel to campaigns in 2006 was YouTube, which burst onto the scene in 2005. YouTube eventually became a medium where candidates could broadcast video of campaign stops, campaign commercials, candidate debates, etc. In addition, it became a repository where citizens could view information about political candidates. However, as some candidates learned the hard way, YouTube

also increased the degree of public exposure on the campaign trail and the potential to get caught saying something controversial.

This is exactly what happened in 2006 when George Allen, a U.S. senator running for re-election, made public remarks during a campaign rally. A campaign worker who was at the event on behalf of Allen's opponent, Jim Webb, captured the controversial remarks on camera and they were subsequently broadcast on YouTube. In the video, Allen could be heard referring to Webb's campaign volunteer on more than one occasion as "macaca." The volunteer, S. R. Sridhar, was a U.S. citizen of Indian descent, and Allen was criticized for being racially insensitive. The meaning of the term is disputed but news sources contend the word is either a substitute term for "monkey" or a French racist slur used to describe Africans. After the video went viral on YouTube, Allen apologized for the remarks but stated that he made up the term and did not know what it meant.

When Allen lost his bid for re-election to the Senate, many attributed his loss to his remarks and the publicity they received, derailing his campaign and severely damaging his prospects. Allen's unexpected loss helped the Democrats to capture their very narrow lead in the U.S. Senate. Although his faux pas had an immediate effect on the 2006 midterm election, it was also instructive to candidates running in subsequent election cycles. Political candidates were put on notice that they were no longer immune to exposure and that their words and actions anywhere could be captured and broadcast with relative ease.

Although YouTube footage can hurt political candidates, it also has the potential to help campaigns. YouTube allows candidates to gain more control over the type and amount of information that is disseminated. It also allows candidates to bypass the media and to post whatever footage they feel will best showcase the campaign or the candidate.

Robocalls

When it comes to social media techniques, potential voters are arguably more likely to seek them out on their own volition. On the other hand, citizens who receive robocalls may wish to block the incoming messages because of the

nature of the message and the frequency of contact. Robocalls are automated messages used by campaigns to contact mass numbers of potential voters. Campaigns elect to use this technology because it is less expensive than other methods of contacting voters, such as door-to-door canvassing or direct mail. These automated calls are designed to encourage turnout on Election Day or to provide information with the intent of soliciting a vote for a particular candidate or a campaign contribution. However, the potential for this technology to backfire is higher than for other mediums. If the content of these automated messages is too negative or if voters are contacted incessantly, it may dissuade the individual from voting or may persuade him or her to vote for the opponent.

During the 2006 congressional election, a study conducted by the Pew Internet and American Life Project found that 64 percent of registered voters indicated that they had received a robocall in the final stretch of the campaign season. The study also found that respondents reported being contacted by robocalls more than by any other type of communication except direct mail. If anything, the use of robocalls has likely increased in subsequent elections as technology has become more adept at targeting voters.

E-mails, Cell Phones, and Text Messaging

As cell phones have become more portable and as more individuals have come to own a personal computer, campaigns have learned to capitalize on this technology. These media have become a good way for candidates to mobilize supporters, to solicit funds, and to ask supporters to initiate contact with undecided family members or friends. While the media can track YouTube posts or monitor campaign finance Web sites, they have a much harder time following e-mail chains or text messages. E-mails also advantage campaigns because they provide an inexpensive method of contacting individuals and acquiring additional personal information about the potential supporters. Despite the potential benefits of this technology, according to a study conducted by the Pew Internet and American Life Project, only 14 percent of registered voters reported that they had received an e-mail communication from a campaign in 2006.

The increase in cell phone use, however, has presented one key drawback for survey researchers and pollsters. As more youth rely solely on cell phones, conducting sound surveys is becoming more problematic. For instance, as respondents become more geographically mobile they may not change their cell phone numbers to reflect their current area of residence. This presents obstacles for researchers who wish to speak only with residents of a particular state or region.

Citizen Media Usage in 2006

Although campaigns are increasingly using technology to reach voters and potential supporters, it remains to be seen whether this coincides with where citizens actually report they are getting their campaign information. In order to determine the viewing habits of Americans and their interactions with technology, the Pew Internet and American Life Project and the Pew Research Center for the People and the Press conducted a daily tracking survey of Americans at the end of 2006. The survey showed that Americans still get the majority of their news about campaigns from television and newspapers. However, 15 percent of survey respondents reported getting the majority of their campaign news from the Internet. This figure is approximately double the number of respondents who made the same claim in 2002, the previous time midterm elections were held. In addition, the survey concluded that voters from both major political parties were just as likely to cite the Internet as their main source of news. In other words, in 2006, neither party could claim a stronger Internet presence among Americans.

For those Americans who reported utilizing the Internet in 2006, the top reasons for doing so were to collect information about the candidates and campaigns and to exchange communications about them with others. A small portion of Americans went further and reported posting their own political commentary to a Web site or blog or forwarding someone else's. Finally, campaign Internet users reported getting their political information most from news portals like Google News, from major network and cable television Web sites, from local news Web sites, and from online national newspaper content. However, approximately 20 percent of campaign Internet

users reported getting their news from less conventional sources like blogs, international news organization Web sites, candidate Web sites, and satirical news Web sites.

Campaigns, Congressional (2008)

Several innovations in social media took place just before the 2008 election cycle. Many of these technologies had just been launched during the 2006 election but were so new that no one was really using them. In 2008, candidates at both the congressional and presidential level were just beginning to test the possibilities and limits of social media. Social networking sites like Facebook and Second Life were launched in 2003 and had somewhat established conventions for political campaigning. YouTube was the big story in the 2008 election, having launched only a few years earlier in 2005. The 2008 election was the first time candidates used Twitter as a campaign technology. The site had just been launched in 2006. In addition to these relatively new forms of technology, there were established online campaign techniques, such as e-mailing and blogging, which continued to be popular in 2008.

The 2008 congressional elections were an important time for the Democratic Party. In 2006, the Democratic Party won a majority of seats in the House of Representatives, and the trend toward Democratic leadership continued in 2008. All of the seats in the House of Representatives were up for election in 2008. The Democratic Party won an additional 21 seats in the 2008 election, giving them 257 seats to the Republicans' 178 seats. Unlike the House of Representatives, going into the 2008 election, the Senate was evenly split: 49 Democrats, 49 Republicans, and two Independents (Bernie Sanders of Vermont and Joe Lieberman of Connecticut). However, it is worth noting that the two Independents had been caucusing with the Democrats, so the Senate had been operating with a Democratic majority since 2006. In the Senate, 35 of the 100 seats were up for election in 2008. The Democrats gained eight Senate seats in the 2008 election, giving them a majority in both the House and the Senate. After the 2008 election, Nancy Pelosi continued as Speaker of the House of Representatives, a position she maintained until the Republicans regained the House in the 2010 election. Harry Reid continued as the majority leader in the Senate, a position he continued to hold after the 2012 election. With President Barack Obama taking office in 2008, this was the first time in more than a decade that the country was under single-party leadership.

Much of the attention in the 2008 election cycle was focused on the contentious presidential race. Candidates for both parties began announcing their campaigns in January 2008. The Republican nomination was secured by John McCain relatively early in the primary season. The Democratic Party primary contest continued through June 2008, when Obama secured the nomination over Hillary Clinton, the presumptive nominee. The 2008 presidential election was the most expensive presidential election on record. The two major candidates spent more than \$1 billion during the election cycle. A major source of campaign funding was online donations. Candidate Ron Paul set fund-raising records by collecting \$6 million online in a single day. Obama's campaign made extensive use of social media, online organizing, and online fund-raising. Many of the lessons of the Obama campaign would not be adopted by congressional candidates until the 2010 election.

Still, there were many congressional candidates using social media during the 2008 election.

Studies and Reports

The adoption of social media by congressional candidates was likely fueled by the fact that voters were spending a substantial amount of time online in 2008. A Pew Internet and American Life Project report stated that the 2008 election was an important time for the Internet and politics. Approximately 40 percent of all Americans got their news and campaign information online. People were not using official news sites just for information. Approximately 39 percent of Americans accessed primary news documents directly from the campaigns. Additionally, 19 percent of Americans were going online once a week or more to do things related to the campaign, and 23 percent of Americans were either receiving e-mail from campaigns or using e-mail to engage in political debate. By June 2008, nearly one in 10 Americans had made a campaign donation online. The amount of voter activity online made social media an enticing place for political campaigns.

The partisan breakdown for political activity shows little difference between voter behavior based on party affiliation. The Pew Foundation reports that 78 percent of Republicans, 74 percent of Democrats, and 76 percent of independents spend time online. Of those, 55 percent of Republicans, 61 percent of Democrats, and 56 percent of independents viewed news related to the 2008 election online. The real breakdown was less along party lines and more along age lines. Younger Internet users were more likely to be Democrats and tended to favor Obama over Clinton in the presidential election. Obama supporters, overall, were more likely to use a variety of online technology: online video, e-mail, and social networking sites. Research also indicates that Democratic candidates behaved differently online. The Pew Research Foundation found that Democratic candidates were more likely than their Republican counterparts to use the Internet as a place to break a story and bypass more traditional mass media outlets.

While most voters and candidates were using the Internet during the 2008 election cycle, many of them seemed to be wary of the information they found online.

The Pew Foundation reports that 60 percent of Internet users agreed with the statement “The Internet is full of misinformation and propaganda that too many voters believe is accurate.” Almost half of those polled did not believe that the news information they received online was the same as the information they received elsewhere. Additionally, more than one-third of people polled thought that the “the Internet let those with the loudest voices and most extreme positions drown out average people’s views.” The Internet did not seem to be a place that voters trusted for their news. Instead, 37 percent of voters said they went online to feel connected to candidates and engaged with the election process. Younger Internet users, in particular, saw the Internet as a place to connect with the democratic process.

Relationship Between Social Media and Mass Media

Oftentimes social media was simply a route to the mainstream media. In 2008, social media was often used to generate “earned media.” Earned media is when a politician does something that generates media buzz that does not have to be paid for by the candidate. A candidate’s daily activities, statements, or successes may be reported by the news media, giving him/her increased exposure to voters. In this way, it is distinct from paid advertising. Online, take for example Democrat Mike Gravel’s YouTube ad “Rock.” In this ad, Gravel spends the first minute staring at the camera saying nothing. Then, he turns away from the camera, throws a rock in a lake, and spends the next minute walking away from the camera. Gravel, a little-known candidate before this video, was invited to appear on news shows of multiple networks to explain the meaning of the advertisement. The commercial generated a large amount of free press for the candidate. In a year when the average cost of winning a House race was nearly \$1.1 million, using social media to generate “earned media” could provide an important strategic advantage.

While online activities can help a candidate generate interest in his/her campaign, offline activities can also spur actions online that hurt a campaign. In 2008, Michele Bachmann narrowly beat Elwyn Tinklenberg and Bob Anderson to become the District 6 representative for the state

Mike Gravel’s 2007 YouTube ad, “Rock,” gained him national attention and an Internet following. YouTube launched in 2005 and was first tested as a medium for reaching voters during political campaigns in the 2008 election.

of Minnesota. During the election, Bachmann received attention for going on the MSNBC show *Hardball* and calling for an investigation to determine if Barack and Michelle Obama were “pro-America or anti-America.” The *Huffington Post*, an online news site, wrote stories about the event, calling Bachmann’s statements modern McCarthyism. Blogging sites DailyKos and OpenLeft began distributing the video of Bachmann’s interview and using the interview to direct traffic to the fund-raising site ActBlue. In the weekend following the interview, Tinklenberg received over \$700,000 in donations, and ActBlue received more than \$300,000. In the end Bachmann still won the election, but the event helped to demonstrate the way mainstream media reporting can impact online activities.

YouTube

YouTube was launched in February 2005, and during the 2006 election the site was still in its infancy. The campaigns for the 2008 election were an important period for candidates learning how to operate the technology and testing its potential. The Pew Foundation reports that 35 percent

of Americans watched online videos during the 2008 election cycle. Political videos were created and distributed by a variety of sources, including individuals, campaigns, and other political organizations. Research seems to indicate that many of these videos maintained the format of political commercials before YouTube. They averaged about 30 seconds and they made use of many traditional tactics seen in television campaigns. The most-viewed political videos in the congressional election on YouTube were consistently attack ads. Approximately 44 percent of the political videos posted in relation to the congressional campaigns were 30-second advertisements.

One major difference between YouTube videos and more traditional television advertising was the ability for average citizens and political organizations to distribute videos without incurring the large cost associated with mainstream media advertising. A primary example of this was a video of George Allen during the 2006 midterm elections titled "Macaca Moment." Republican George Allen served as senator from Virginia from 2001 to 2007. While running for re-election in 2006, during a campaign stop Allen pointed to S. R. Sidarth, a campaign tracker filming the event, and referred to him as a "Macaca." The term means "monkey" and was originally used by colonists in Africa to refer to the native black population. The video of the event was widely distributed online, and the attention it received from bloggers generated significant coverage by the mainstream press. The event is credited with costing Allen the 2006 election. The video and the resulting loss demonstrated the power YouTube afforded citizen journalists. Because of the video and the resulting loss, congressional candidates went into 2008 well aware of the power of YouTube.

In the Minnesota Senate race between Republican incumbent Norm Coleman and Democrat Al Franken, there were multiple allegations about Coleman's ethics while in office. YouTube users, such as NormColemanMustGo, made and distributed videos challenging Coleman and supporting Franken. Franken won the race and this was one of several gains made by the Democrats in Congress.

With so many citizens posting YouTube videos, it was important for candidates to make their

own voice heard on the site. Approximately 70 percent of congressional candidates had their own YouTube channel during the 2008 election. The median number of videos posted was 20.5. Often these videos were commercials that had aired on television, speeches given on the campaign trail, or footage of campaign rallies. At the high end of the pool, Nancy Pelosi, Democratic representative from California, posted 1,445 videos during the campaign. The site was primarily used by incumbent candidates who had a strong base and the resources to devote campaign staff to developing videos.

In the North Carolina Senate race between Elizabeth Dole and Kay Hagan, traditional attack ads featured prominently on the candidates' YouTube channels. The Dole campaign posted a television advertisement called "Promises," which received more than 100,000 views. The ad accused Hagan of hosting secret fund-raisers with a prominent atheist group and asked what kind of promises Hagan was making in exchange for campaign funds. One of Hagan's most popular YouTube videos, receiving more than 130,000 views, was called "Belief." In this 30-second ad, Hagan responded to the challenges Dole made about her Christian beliefs and accused Dole of faking her voice.

The official campaigns for Dole and Hagan posted several advertisements dedicated to the question of Hagan's religious beliefs. In support of these candidates, outside organizations made longer versions of these advertisements that were also popular on YouTube. The National Republican Senatorial Committee made a two-and-a-half-minute Web video called "Godless," which included more clips of representatives from the Godless Americans PAC. In response, MoveOn and the Democratic Senatorial Campaign Committee created Web videos questioning Dole's voting record and accusing her of taking money from oil companies to thwart green energy initiatives. These advertisements were often television commercials that were being circulated on the Web through YouTube.

Myspace and Facebook

The big social media story of 2008 was YouTube, but more traditional social networking sites also played a key role in the election. Specifically,

Myspace and Facebook were important places for candidates to get to know the voters. Myspace was launched in 2003, and Facebook followed shortly after in 2004. Both sites were used by candidates and voters to distribute campaign information in the 2006 election. During the 2008 campaign, Facebook introduced features that allowed users to design applications for other users. Campaigns took advantage of this to turn the site into a phone bank, raise funds, and release news to users. During the 2006 election, Facebook made profile pages for every candidate running for office and provided campaigns with the passwords necessary to access and maintain these sites. In 2008, Facebook switched from candidate “profiles” to candidate “pages.” The original candidate profiles were similar to other user profiles, and Facebook users could friend a candidate just like they could anyone else. With pages, users “liked” candidates instead of friending them. This created a distinction between general users and politicians. Much like with the candidate profiles, Facebook required an official campaign representative to create the page and to maintain it.

Facebook was popular among congressional candidates in 2008. In the Senate, 89.6 percent of candidates had profiles and in the House it was 72.4 percent. In 2008, the use of Facebook was most successful for politicians who were already well known. Candidates such as Nancy Pelosi, Barney Frank, and Rahm Emanuel saw continual increases in Facebook supporters throughout the election. Other candidates might have sustained activity, even if it was less.

Twitter

Like YouTube, Twitter was still a fairly new technology during the 2008 election. Twitter was founded in 2006. There were approximately 1.6 million tweets in 2007, and by 2008 that number had grown to more than 400 million tweets. During the election, those politicians who did tweet used the technology primarily to report their location or talk about their activities for the day. Some early adopters in the Senate were Marco Rubio, a Republican senator from Florida who joined in August 2008, and Claire McCaskill, a Democratic senator from Missouri who joined in September 2008. McCaskill’s use of social media is noteworthy in that she maintained her Twitter

and Facebook accounts herself. Most political candidates hired staff to maintain their profiles and produce tweets. Neither of these politicians was up for re-election. Al Franken, a Democrat from Minnesota who was elected to the Senate in 2008, was one of the few campaigning senators to use the technology during the election. In the House of Representatives, where everyone was up for election, several candidates used the technology. Notable among them are John Boehner, Republican representative from Ohio who, as an incumbent, defeated Nicholas Von Stein with 68 percent of the vote. Boehner was quite familiar with the technology, having joined Twitter in July 2007. House Speaker Nancy Pelosi, Democratic representative from California, joined Twitter in August 2008. Pelosi was considered to be in a “safe district”—in 2008 she won 72 percent of the vote—but her campaign still kept up with most of the major advances in social media.

Some members of Congress were using Twitter for political conversations outside the election. Republican Representative John Culberson of Texas and Democratic Representative Tim Ryan of Ohio took to Twitter during the summer of 2008 to debate the ethics of opening the Arctic National Wildlife Refuge in Alaska to oil drilling. Culberson and Ryan both won their elections by wide margins that year and were campaigning in what were considered “safe” districts.

While Twitter was used by candidates to discuss political issues and campaign, it was used by other organizations during the election to monitor the voting process. In 2008, a project called “Twit the Vote” encouraged users to use iPhones at the polls to tweet about any difficulties with the voting process and provide updates on wait times at polling stations. These tweets were combined with Google Maps to give voters a picture of the voting process throughout the day. The information was also collected by Vote Report to help monitor fraud and other problems on Election Day.

Second Life

Some congressional candidates were more immersed in the new media than others. For instance, George Miller, a Democratic representative from the San Francisco Bay Area who has served from 1975 to the present, used a variety of social media outlets during the 2008 campaign.

Miller had an avatar on the site Second Life, he ran a podcast called MillerTV, and he had a regularly active blog site. All of these formats have allowed Miller to answer questions directly from his constituents.

Miller was not the only congressional candidate to make use of Second Life for political campaigning. Second Life was launched in 2003, and by 2008 many universities and businesses were establishing a presence within the virtual world. During the 2008 election, several candidates set up offices in Second Life. Ron Paul, a member of the U.S. House of Representatives from Texas, and YearlyKos, an early version of the popular conference Netroots Nation run by Daily Kos, both held political rallies in Second Life during the 2008 election. It is unclear how much the site actually contributed to election outcomes, but the site was sufficiently established that it was a standard place for political campaigning.

E-mail was an established form of campaign communication prior to the 2008 election. Bill Clinton used e-mail as a form of political campaigning during the 1992 presidential election. Both President George W. Bush and Democratic candidate John Kerry used e-mail during the 2004 election to release breaking news and to organize volunteers. So, by 2008 e-mail, unlike other social media, had become a conventional campaign method. The Pew Research Foundation reports that 23 percent of Americans received an election-related e-mail at least once a week during the 2008 election. These e-mails often urged voters to support a particular candidate or discuss a particular political issue. Most candidates collected the e-mail addresses of supporters when they visited the campaign Web site. However, this required a voter who was proactively interested in the candidate. Republican campaign firms like Voter Contact Service and the Voter Emailing Company were popular during the election for their database of potential voters. These firms provided candidates with access to voters who might not take the initiative to visit a campaign site.

Mobile Technology

One emerging trend during the 2008 election was the use of mobile technology by political campaigns. Barack Obama broke new ground when

he used text messaging to announce the selection of Joe Biden as his running mate. The presidential candidates also made use of the recent emergence of the smartphone by developing phone applications that made it possible for supporters to do campaign fund-raising from their personal phones. In 2008, congressional candidates were slow to catch on to text messaging. Mainly, they faced a problem collecting cell phone numbers of supporters. By 2010, candidates like Senator Robin Carnahan and Representative Roy Blunt were using stunts and gimmicks to get voters to contact them by text message. The contact allowed them to develop databases of voters for sending out campaign news and organizing supporters by text messaging.

Much of the movement forward in social media campaigning in 2008 was made by the presidential candidates. The slow rate at which many members of Congress adopted social media might be attributed to the rules that governed use of the Web in 2008. Prior to 2008, members of Congress were not allowed to post any official statements on social media sites. All official statements had to go through House.gov or Senate.gov. Social media sites could be used for campaigning but were not allowed for other activities. As a result, most candidates were simply unfamiliar with the sites. Additionally, most candidates hired people to do their social media campaigning, and for some candidates that expense was a luxury they could not afford.

Campaigns, Congressional (2010)

Social media was in its infancy and thus sparsely used in the 2006 elections. It played a more prominent part in the 2008 campaigns. By 2010, the use of sites like Facebook and Twitter became regular features in the congressional elections.

Republicans won 63 seats in the House of Representatives and six seats in the U.S. Senate. The 63 seat pickup in the House allowed Republicans to capture majority control and was nine more than they gained in the 1994 midterm election that ushered in the so-called Republican revolution in Congress.

The six seats in the Senate were less than commonly expected earlier in the year and allowed Democrats to retain control of the U.S. Senate. The use of social media helped fuel the Tea Party movement and the anti-Washington and anti-incumbent moods that aided the Republicans' ascent in the House. It also worked to curb their chances of winning some key seats in the Senate.

Facebook, Twitter, and YouTube barely existed during the 2006 midterm election. A YouTube video led to a change in campaigning as a result of the so-called macaca moment, in which Virginia Senator George Allen was caught on tape using a racial slur and eventually lost his re-election bid. By 2008 and 2010, candidates were well aware that their every statement on the campaign trail could be recorded and was likely to end up on social media sites and go viral within moments.

Incumbents and challengers used social media to advertise their positions, attack opponents, raise money, and gain notoriety in 2010. A main reason that candidates gravitated to social media is because voters were using it to gather information and make decisions about who to support. While there was tremendous activity online, there is less of a correlation to greater voter turnout or determining victorious candidates from their use of social media.

Studies and Reports

According to a Pew Internet report, 73 percent of adult Internet users used online sources to get information about or get involved in the 2010 campaigns. This represented 54 percent of all adults. Of those online political users, 58 percent looked online for news about politics, and 32 percent in the United States reported that they got most of their information about the 2010 campaigns from sources online.

About 21 percent of adults used Facebook or Myspace or another social networking site for political purposes during the 2010 campaigns, according to the Pew surveys. Another 2 percent used Twitter. Nine percent said they received candidate information, 8 percent posted political content, and 7 percent friended a candidate or political group on a social networking site. One percent said they used Twitter to follow the election results in 2010 as they were happening.

The Pew report found that political social media users were younger and generally more educated than other Internet users. About 42 percent were younger than 30 years old, and 41 percent had college degrees. Demographically, they were similar to all Internet users in terms of race, gender, and income.

The survey found 40 percent of Republican voters and 38 percent of Democratic voters got involved in the campaigns through the use of social media. About 22 percent of those who identified as Tea Party supporters used social media sites for political purposes. Of the Internet users identified in the report, they voted for Republican candidates for Congress by a 45 to 41 percent margin over Democratic candidates.

Still, the main source of campaign news for Pew survey participants was television (67 percent), which was consistent with the past two midterm

elections. Newspapers garnered 27 percent, while the Internet provided 24 percent of the campaign news. That was up from 15 percent in 2006 and 13 percent in 2002. Radio held relatively steady at 14 percent. Internet news sources cut primarily into the influence of newspapers, which dropped from 34 percent in 2006.

The percentage of adult online users who viewed videos online increased from 19 percent in 2006 to 31 percent in 2010. Users with higher education and income levels were more likely to watch political videos online. Viewing was relatively consistent across age groups. Men (36 percent) were more likely than women (26 percent) to watch political content. White non-Hispanics (33 percent) viewed online videos more than black non-Hispanic (24 percent) and Hispanic (23 percent) users.

By party, Republicans were more likely to view videos online in 2010 than Democrats in the Pew poll. About 40 percent of Republicans watched online videos, up from 19 percent in 2006, while Democrats increased to 32 percent in 2010 from 24 percent in 2006. Twenty-two percent of non-voters admitted to watching political videos online in 2010, up from 16 percent in 2006.

The main sources of online news according to the Pew report were the major cable networks and the search engines. CNN.com was used by 22 percent, followed by Yahoo.com at 20 percent, Google.com at 13 percent, and Fox and Msn.com at 10 percent. MSNBC.com was used by 7 percent, and AOL.com and the *New York Times* by 4 percent, and then the candidates' Web sites and *Drudge Report* at 2 percent, followed by the *Huffington Post* identified by 1 percent. Twenty-nine percent of users were using other sources.

Another use of social media was to connect and interact with campaigns. Sixteen percent of adults said they sent e-mails related to the elections, and 17 percent revealed online for whom they would vote. Seven percent gathered information or organized meetings through social media, while 6 percent took part in an online discussion, listserv, or other political activity. Five percent used the Internet to volunteer, help a campaign, or get people to the polls.

One comprehensive report by OhMyGov Inc. found that Republicans in Congress fared better than Democrats in getting Facebook "likes" as a

measure of fans. This was likely due to increased enthusiasm to get involved and vote. The report counted the fans and friends for the official Facebook pages from May 1 to August 31, 2010, of the members of the 111th Congress. They found that 251 of 255 Democratic members (98.4 percent) and 169 of 178 Republican members (94.9 percent) had fan pages. In the Senate, 53 of the 57 Democratic senators (92.9 percent) and 39 of 41 Republican senators (95.1 percent) had fan pages. They did not count independent members.

They measured the rate at which fans were added to measure public sentiment on Facebook. The report found that Republicans increased their number of fans faster than Democrats. Republicans also had more fans overall. They numbered 1,634,127 on May 1 and 2,148,619 on August 31. Democrats increased from 780,035 on May 1 to 952,847 on August 31. The increase among House Republicans was at a statistically significant rate, while in the Senate, there were no significant differences based on party. This was pertinent because there were fewer Republicans in Congress at the time.

Research by Bloomberg found that all 73 Democratic and Republican candidates for Senate had Facebook accounts, 72 of them had Web sites, and 70 used Twitter. There were YouTube accounts on 85 percent and blogs on 43 percent of the Web sites.

The day after the election, Facebook reported that 74 percent of House candidates and 81 percent of the Senate candidates with the most Facebook fans on their sites won their contests.

Another report by HeadCount.org also found that Republicans appeared to be more engaged than Democrats in the online world in 2010. Republican candidates for Senate had 1.4 million Facebook friends and more than 500,000 followers on Twitter compared to 300,000 friends and 90,000 followers for their Democratic opponents.

A study by the E-Voter Institute found that three out of five Americans who considered themselves as somewhat politically active were members of a social network. The study also found that 70 percent of them planned to vote in 2010. More than two out of five voters expected candidates to make campaign information available or to engage supporters using social media. Forty percent expected candidates to use Twitter, and around half of

respondents expected online ads, campaign videos, blogs, Webcasts and podcasts. Two-thirds expected to receive e-mails and TV ads. Eight out of 10 expected an official Web site.

A study from the University of Michigan School of Information and the College of Engineering looked at the use of Twitter in the 2010 campaign. It found that conservatives were the most active tweeters during the campaign cycle. It analyzed tweets from 687 candidates for the U.S. House, Senate, and gubernatorial seats. The study found that Republicans and specifically Tea Party candidates tweeted more often than Democrats. The Republicans tweeted an average of 732 times over a three-year period compared to 551 tweets for Democrats.

Republicans tended to tweet about economic issues with posts related to “bills,” “budget,” “deficit,” “spending,” and “WSJ” (*Wall Street Journal*), as well as “Bush” as top topics. Democrats focused on a variety of topics like “education,” “jobs,” “oil spill,” “clean energy,” “reform,” and “Afghanistan.”

The self-identified Tea Party candidates were studied closely. Despite the image of the Tea Party as a disparate, grassroots, unorganized movement, researchers found that Tea Party members formed more of an online community than the other candidates. Tea Party members retweeted each other’s messages an average of 82.6 times, compared to 52.2 for Republicans and 40 retweets for Democrats. Tea Party proponents specifically tweeted about then-Speaker of the House Nancy Pelosi, liberal Massachusetts Congressman Barney Frank, and former President Bill Clinton, all perceived as adversaries to the conservative movement.

The Michigan researchers were able to predict election outcomes with 88 percent accuracy based on the number and content of tweets, the number of followers, and taking into account incumbency. They found that too many tweets could be a campaign liability, and the proper amount and tone of the social networking done by candidates would be in a middle range.

Traditional and Social Media Blend

Both traditional and new media companies found innovative ways to use social media in 2010. Twitter and iPad formats were two of the most-used platforms by the traditional media companies.

Traditional media companies found ways to use social media to increase their brands. The *Washington Post* coined the #Elections hashtag on Twitter, the first news organization to do that. The *New York Times* created maps and charts for election monitoring that were viewable on the iPad. The *New York Times* also created a Twitter visualization to track election discussions on that social network. The *Wall Street Journal* did live election coverage available online and on the iPad.

Twitter encouraged voters to use the hashtag #votereport to tell about their experiences at the polls and use #NYCvotes specifically for New York voters. Foursquare created a real-time map of where people were voting. It also offered an “I Voted” badge to anyone who checked in at his or her polling station while voting.

Facebook posted notes to remind people to vote and apps to help people find polling locations.

Scientists from the University of California, San Diego, studied the impact of Facebook on voting in 2010. On November 2, almost all of the 61 million who signed onto Facebook received a get-out-the-vote message on the top of the news feed. The nonpartisan message included a reminder that it was Election Day, a link to local polling places, and an option to click on “I Voted” to be included in a count of Facebook users who had reported voting. It also included pictures of up to six of their friends who reported voting.

In the study, published in the September 13, 2012, issue of *Nature*, two control groups of 600,000 did not receive the pictures. One group had the get-out-the-vote message, and the other group did not receive any message. Researchers then examined public voting records to determine actual voter turnout among the various groups.

They found that the message that showed a user pictures of their friends who had voted was directly responsible for 60,000 additional votes nationwide. They also concluded that it was responsible for 280,000 indirect votes by friends of friends, which they termed the “social contagion effect.”

Because only about 1 percent of Facebook users stated their political affiliations, the role of ideology or party could not be determined. With about 90.7 million total voters in 2010, about 37.8 percent voter turnout, the number of votes tracked

did not sway the national results but could have played a significant factor in individual races.

Ultimately of significance from this study, according to the authors, is their conclusion that online activities could influence real-world actions like voting.

House, Senate, and Gubernatorial Races

The candidate with more Facebook fans won six of the 10 top contests for the U.S. Senate (California, Illinois, Missouri, Pennsylvania, West Virginia, and Wisconsin).

Five of the top 10 candidates searched on Google in October won their races, and five lost. The top 10 most-searched candidates in Google News for October 2010 included the two candidates for governor of California. The first was Meg Whitman, former chief executive officer (CEO) of eBay and Republican candidate, and fourth was Democrat Jerry Brown.

The second-most searched was Senate Majority Leader Harry Reid, who survived a re-election challenge from Tea Party candidate Sharon Angle, the fifth-most searched candidate.

The third-most searched was Rand Paul, Tea Party-backed candidate for Senate from Kentucky, who won his race. Paul, son of Texas Congressman Ron Paul, was an important figure in the emergence of the Tea Party and in making the movement a national phenomenon.

The sixth and seventh were high-profile, yet losing candidates who also had Tea Party support, Carl Paladino for governor of New York and Linda McMahon for a Senate seat from Connecticut. Then-Speaker Nancy Pelosi was the only House member in the top 10, at number eight. Patty Murray, an incumbent Senator from Washington, was ninth.

Charlie Crist, the governor of Florida who was forced out of the Republican Party by Tea Party favorite Marco Rubio, who won the Senate seat, was 10th. Crist ran as an independent against Rubio and Democrat Kendrick Meek. There was speculation late in the campaign that Crist would gain support from Bill Clinton and announce he would caucus with Democrats if he won the race in an attempt to bolster moderate and Democratic voters to support him over Rubio.

Rubio ultimately won the seat aided by his own popularity online. Rubio launched his campaign

with a YouTube video on May 5, 2009, with a 2:49-minute video discussing why he was running for the Senate and used campaign videos and social networking throughout the campaign to get his message across to voters of different age groups and demographics. In the three-way race, Rubio accounted for 72 percent of all Facebook “likes,” 58 percent of all Twitter followers, 85 percent of all YouTube views, 55 percent of all Web visits to candidate Web sites, and 48.9 percent of the final vote. His campaign raised donations from one in three of his e-mail subscribers. In October 2010, Rubio had 128,800 Facebook followers, compared to 51,600 for Crist and Meek combined. Rubio’s television ads urged viewers to follow him on Facebook. Rubio’s use of Twitter was also prolific during the campaign. Early in the campaign, he would post updates from the campaign trail using Twitter and Facebook. But, after an incident in May 2009, when he disclosed personal information about a date night with his wife that was picked by the *Miami Herald*, Rubio was more reserved in his use of social media.

Angle in Nevada had about 94,700 Facebook friends in October 2010 compared to 13,700 for Reid, the Senate majority leader. Christine O’Donnell had 25,600, twice as many as her opponent Chris Coons in the race for the Delaware Senate seat. Both Angle and O’Donnell lost their races even as they gained national notoriety for their support from the Tea Party.

According to the Project for Excellence in Journalism, President Barack Obama was the subject of the largest number of stories online from January through October 2010.

Republican Senate nominee from Delaware Christine O’Donnell, a Tea Party-backed candidate, was second. O’Donnell garnered much attention for some comments she made before she was a candidate. O’Donnell had said that she “dabbled into witchcraft” in a 1999 episode of *Politically Incorrect* with Bill Maher. When those clips became Internet sensations during the 2010 campaign, O’Donnell felt compelled to address the issue. She ran a 30-second ad in which she said, “I’m not a witch. I’m nothing you’ve heard. I’m you.” The ad, uploaded on YouTube on October 4, 2010, had more than 1 million views and caused more harm than good for her campaign by perpetuating the story and inviting ridicule of her candidacy. It

led to Web chatter that questioned her fitness as a candidate and invited further scrutiny of her campaign. By the end of October, O'Donnell publicly regretted making and airing the video.

Meg Whitman, who spent more than \$160 million of her own money on her campaign, was the subject of the third-most stories, followed by Kentucky candidate Rand Paul.

Joe Sestak, who was challenging for a Senate seat out of Pennsylvania, was fifth. Sestak was a Congressman from eastern Pennsylvania who decided to challenge Senator Arlen Specter for the Democratic nomination. Specter was a long-time moderate Republican who switched parties in 2011 to avoid a primary challenge from a more conservative Republican, which he was widely expected to lose. President Obama, Vice President Joe Biden, and Governor Ed Rendell supported

Specter and tried to dissuade Sestak from challenging him. An online straw poll by the Progressive Change Campaign Committee from May 6 through 11, 2009, called "Should a Draft Sestak movement be created to take on Sen. Arlen Specter in the Pennsylvania Democratic primary?" garnered 8,000 votes nationwide, with 86 percent responding yes and 85 percent of Pennsylvanians in support. Sestak took on the Democratic establishment and defeated Specter in the primary before ultimately losing to Republican Pat Toomey in the general election.

Nevada Senate foes Angle and Reid were sixth and seventh on the list, then Crist and Paladino. Arkansas Senator Blanche Lincoln, a Democrat who angered many in her party and ultimately lost re-election, was ninth. Gubernatorial candidate Brown of California was 10th.

In early 2010, the campaign of Carly Fiorina caused an online stir with a Web video. Fiorina, a former Hewlett-Packard chief executive officer (CEO), was running in the Republican primary for U.S. Senate in California. The so-called demon sheep 3:22-minute-long video posted on YouTube depicted her opponent, former Representative Tom Campbell, as a fiscal conservative in name only (FCINO) as a play on Republican in name only (RINO). The video showed footage of docile sheep walking in a field before switching to images of Campbell, while the narrator criticized Campbell's past positions as not being fiscally conservative. Then, it switched back to the field, and there was an image of a person, supposedly Campbell, in a sheep's costume and with bright, glowing-red eyes. The campaign claimed that they were depicting that Campbell was a wolf in sheep's clothing. The ad was viewed more than 100,000 times online that week and led to a #demonssheep hashtag, a top-trending phrase in a few days, largely through the ad being mocked. California Democrats countered the video with three of their own that took on the Republican challengers Fiorina, Campbell, and Chuck DeVore. Fiorina went on to win the primary over Campbell. She was defeated in the general election by incumbent Democrat Barbara Boxer. Fiorina had 306,000 Twitter followers, while Boxer had 23,400.

Another provocative ad was used by Democrat Alan Grayson in central Florida against Dan Webster for a House seat. The ad, titled "Taliban

A Tea Party protest sign from the Taxpayer March on Washington, D.C., on September 9, 2009. During the 2010 congressional campaign, conservatives, particularly those identifying with the Tea Party, were the most active users of social media.

Dan Webster,” actually aired on television before it went viral and caused an Internet reaction. Grayson’s ad took comments by the religiously conservative Webster out of context, quoting the phrases “Wives, submit yourselves to your own husband,” and “She should submit to me—that’s in the Bible.” It repeated “submit to me” in trying to paint Webster as an extremist. Grayson, the incumbent, lost the seat to Webster.

In a strange twist of online activity, an intern with Rand Paul’s campaign was accused of signing onto DailyKos, a progressive political blog site, with a fake identity to post negative comments about Paul’s opponent Jack Conway.

Another odd occurrence was when someone using the handle WingNutWatch joined Twitter and tried to provoke Tea Party activists to tweet racist or suspicious messages. They were collected and monitored on the Web site TeaParty Tracker.

Senator Chuck Grassley of Iowa took to Twitter in 2007 at age 77 and was a frequent tweeter during the 2010 campaign. One of his television ads made light of the fact that Grassley said, “I’ll tweet; I’ll text; I’ll do whatever it takes. I work for you.”

Allen West was elected in the Tea Party movement, the first African American elected to Congress from Florida since Reconstruction. The use of Facebook postings and YouTube clips helped generate excitement about West’s campaign.

Sarah Palin, the 2008 Republican vice presidential nominee, used Facebook and Twitter to generate interest about her favored candidates in the 2010 primary and general election contests. Her SarahPAC raised money online to support conservative candidates and try to defeat Democrats.

When the Republican Majority Leader John Boehner (R-OH) became the speaker of the House in the 112th Congress, he had to find ways to hold the moderate and conservative wings of the Republican Party together, especially with the arrival of more than 40 Tea Party-backed candidates. The use of social media by officials once sworn into office continued to shape political debates throughout the session, including the 2011 showdown over raising the national debt ceiling.

The use of social media in 2010 foreshadowed the role it would play in the 2012 campaigns. It would now be expected that every candidate had a Web page and high visibility on social networking

sites. As the avenues of social media grew and transformed, so did their roles in being used for congressional and presidential elections.

Campaigns, Digital

Evolving media, online technologies, and digital applications have fundamentally changed how political candidates campaign. Candidates

seeking office can no longer rely solely on traditional media outlets and historic campaign strategies to win elections; they must now also campaign where audiences and potential voters are in digital environments. This is not to say that traditional methods of political campaigning are no longer relevant, but in order for a candidate to be successful, campaigns must strategically incorporate digital campaign tactics into overall campaign strategies. Candidates have started to use digital campaign components in almost every aspect of political campaigning.

Evolution of the Digital Campaign

The history of digital campaign tools is relatively short yet substantial and significant. Digital technologies began to make a measurable contribution to political campaigns in the late 1980s, when the fax machine was used to distribute campaign information to the political press. Although, by contemporary standards, the fax machine may not be considered a revolutionary digital tool, it allowed campaigns a method of quickly controlling campaign talking points and providing rebuttals directly to the media. The campaigns of the early 1990s saw e-mail emerge as a campaign tool. E-mail allowed campaigns to send mass and chain e-mails to constituents or potential voters about particular issues or policies. E-mail messages were also seen as tools for empowering voters by encouraging recipients to become more active in the campaign.

However, these early campaigns did not necessarily incorporate e-mail as part of their overall campaign strategies, rather as supplemental communication, and continued to focus their attentions on more traditional campaign methods. As digital campaigns have continued to evolve, e-mail has remained a consistent tool for reaching supporters and potential voters. As most recipients have signed up to receive e-mail from campaigns, it is an effective communication tool, especially when incorporated into broader digital campaign tactics, and still serves as one of the key sources of campaign fund-raising.

In 1994, Senator Dianne Feinstein became the first political candidate to construct a Web site, initiating the use of a communication channel that would permanently change how politicians communicate with voters, fund-raise, and

organize volunteers. Subsequent elections saw a vast rise in the use of candidate Web sites, specifically among presidential candidates, and contemporarily, a candidate cannot be viewed as a serious contender without an official Web site.

The initial integration of Web sites into campaign strategies provided a central location for voters to receive targeted information about candidates, find details about candidates' positions and voting records, and through rudimentary discussion boards, connect with other like-minded voters. Web sites also began to alter the one-to-many method of communication prominent in political campaigning. Voters had the ability to communicate directly with campaigns via e-mail as well as connect with people, across socioeconomic boundaries, through contributions to online discussion groups.

These early Web sites initiated the use of the Internet as a digital campaign tool. Campaigns quickly learned that they could, at least to some extent, use the Internet to control public perception, distribute information directly to the political press and opinion leaders, and quickly raise questions regarding the positions of opposing candidates. Campaigns began sending point-by-point rebuttals of opponent's claims directly to the media, attempted to control the flow of news, and tried to influence how debate outcomes were reported. On a broader political level, national political organizations began to use Web sites to communicate and actively connect with voters and analyze how individuals, beyond early adopters and activists, used the Internet.

However, use of the Internet during these early digital campaigns did not come without criticism. Those leery of the long-term impacts and potentials of the Internet regarded campaign and political communication occurring through it as being symbolic of nothing other than individuals engaging with a popular new medium. Critics questioned the validity of online deliberation, argued that online participation did not equate to a substantive commitment to civic engagement, and struggled to find measurable links between online political interaction and more tangible forms of political engagement, such as voting. Interestingly, many of these criticisms of early digital campaigns still resonate in contemporary assessments regarding the impact of emerging

digital tools, such as social media and mobile applications.

Although the Internet landscape has changed dramatically since the introduction of candidate Web sites, they are still essential tools in integrated political campaign strategies. Candidate Web sites continue to function as the communication hub and serve as the official face of digital campaigns. Contemporary campaign Web sites are the most effective location through which to engage in direct messaging with voters, emphasize important campaign events, and encourage community building among supporters. Candidate Web sites also provide the highest level of image control for campaigns, where embedded videos, news stories, and links to internal social networking sites can control what information voters see and, perhaps most important, what they do not.

Social media Web sites began to emerge as digital campaign tools in the elections of the mid-2000s. While the early functionalities of these Web sites were somewhat limited, they helped generate voter interest and recruit volunteers and fundamentally changed the relationship between voters and campaigns. Social media sites created the perception of a two-way relationship between voters and candidates and greatly expanded the many-to-many format of communication first experienced through discussion boards. Social networking has extended political and campaign communication, expanded opportunities for democratic engagement, altered traditional political margins and hierarchies, and made democracy more accessible. These networks have also become important vehicles through which campaigns clarify and highlight information, generate donations, and mobilize volunteers and voters. When integrated into overarching campaign strategies, social media have helped produce some of the most substantial digital political events thus far in the history of political campaigning.

Digital Campaign Landscape

Digital tools have resulted in substantial changes in how politicians campaign. Voters are no longer passive audience members who must wait for information; rather, the Internet has changed voters into active gatherers and creators of information. Digital environments provide for levels of selectivity and interactivity that are limited

through most traditional mass media formats and allow for extensive engagement with the formalized political system. New interactive media environments encourage networking, organization, the generation of new spaces, and the emergence of new types of communities, all of which provide forums where voters can become integral in digital campaigns. In addition, widespread and affordable access to the Internet, mobile technologies, and other cheap, populist technological tools is providing ways for voters to become more informed, involved, and engaged. As communication technologies have continued to evolve, digital tools, such as online video, social networking sites, candidate Web sites, and mobile applications, have become essential weapons in the arsenals of political campaigns.

Online Video

Online video has become one of the most important tools in digital campaigning. Videos that are appropriately conceptualized and placed can cheaply, quickly, and effectively reach a vast audience, easily generating thousands of views and shares. With the rise of video on demand (VOD) services and the decline in traditional television viewing, the digital environment is ripe with potential audience members. Digital videos can convey a sense of informality between candidates and supporters, introduce potential voters to the everydayness of candidates, and easily reach specific target demographics. Candidates have used online video to announce their candidacies, involve the public in the selection of campaign themes, share campaign information, recruit volunteers, and solicit donations. Campaigns have created, uploaded, and shared thousands of videos, have saved millions of dollars in advertising expenses, and have generated audience views in the hundreds of millions.

Social Networking

In digital campaigns, vast networks of supporters are formed around candidates, parties, issues, and ideas via social networking sites. During election cycles, campaigns work to use the millions of candidates' "friends," posts, comments, and tweets generated on social networking sites to convert enthusiastic participants into active voters. Campaigns utilize the functionalities of

social media sites, such as interactive applications, groups, debate participation, and contests, to consistently engage potential voters in the election process. Through strategies that offer various methods of consistent participant engagement, campaigns can work toward creating a community of like-minded people that will hopefully translate into votes. By incorporating social networking strategies into other methods of digital and traditional campaigning, campaigns are able to spread messages across multiple sites and platforms that complement their target demographics. Campaigns have embraced the role of social media in digital campaigning by allocating significant resources to ensure that target audiences stay active and involved with the campaign through social networking.

Attempting to harness the power of social media, the Barack Obama campaign created its own social networking site, MyBarackObama.com. The campaign used the site, which allowed users to create profiles, friends lists, and personal blogs to encourage users to join groups, participate in fund-raising, arrange events, and participate in volunteer activities. The goal of MyBarackObama.com was to bring supporters from other social networking sites and Obama's candidate Web site to this central hub of Obama supporters, where the campaign's message could be communicated and supporters could be energized to volunteer, donate, and vote.

Campaigns also use social networking for microtargeting (techniques that involve cluster-based marketing to specific demographic segments) of voter constituencies. By establishing profiles on specialized social networking sites that are geared toward specific demographics, such as the black, Latino, Asian American, and the lesbian, gay, bisexual, and transgender (LGBT) communities, campaigns can effectively target demographic segments with talking points that are of specific concern to them. Microtargeting can also be accomplished through the creation of segmented social networking sites, such as the creation of Twitter accounts for each state, which allows campaigns to target state-relevant messages to supporters. This type of digital campaigning allows campaigns to target more aggressive advertising and topics to users of specific sites based on constituency demographics.

Candidate Web Sites

Candidate Web sites remain an important hub of digital campaign communication. Web sites are where the highest levels of message control and candidate image construction occurs and where campaigns can frequently update content and incorporate interactive features to keep voters interested and returning. Voter interaction with candidate Web sites can provide a wealth of information for campaigns. These interactions allow campaigns to create databases of potential voters, effectively and rapidly access voter demographic and issue data, and quickly send targeted e-mails. Campaigns also engage in microtargeting by offering opportunities to join different constituency groups and including state-by-state content pages with local information, both of which allow for targeting constituency-based content.

Mobile Applications

Mobile applications connect voters to campaigns, literally in the palms of their hands, and possess many of the characteristics of the aforementioned technologies. Application users function as digital foot soldiers of the campaigns and through push notifications (a way for an application to send information to a user's phone even when the app is not in use) are often among the first people to get campaign updates and news sent directly to their smartphones. Through mobile apps, users can employ social integration functionalities to post tweets, updates, and messages, send e-mails directly from the campaign to their own social networking pages, help register voters, and access canvassing information directly through the app. Social integration technologies also utilize Google mapping technologies to help supporters find their way to campaign events and polling locations.

Digital Campaign Outcomes

These digital tools serve to supplement and enhance traditional campaign strategies. They also provide new ways of managing a candidate's image and presence, fund-raising, volunteer mobilization, voter engagement, community building, and targeting voters.

Image and Presence

Managing a candidate's image and presence is important in digital campaigning. Digital

technologies can help candidates effectively build their political brands and, if leveraged effectively, this presence can help candidates build political buzz, reach potential voters, build community, and work to translate enthusiasm into votes. Digital platforms are excellent venues through which to float issues, host debates and conversations about relevant campaign topics, and provide message-driven information. Digital campaigns can be used to challenge or rebut statements by or the positions of opponents, to help drive mainstream media coverage, and to circumvent media and political branding by communicating with supporters directly and interactively.

Fund-Raising

Digital fund-raising is perhaps one of the crowning achievements of digital campaigning. In 1998, Barbara Boxer's online fund-raising campaign, which was considered very successful at the time, netted \$25,000. This was just the beginning of the impact that digital technologies would have on campaign fund-raising. Contemporarily, campaigns raise hundreds of millions of dollars online and routinely break fund-raising records for the amount of money that is raised in very short time frames. Digital fund-raising is substantially more cost-efficient than traditional methods of fund-raising, and while the result is often large numbers of small donations, these donations cost campaigns very little to solicit. Campaigns have developed new, inventive, and sometimes gimmicky methods for effectively reaching more donors than has been possible through traditional fund-raising methods. Digital donors often include people who have never given to political campaigns and those who are willing to give small donations repeatedly. Over time, it is possible that digital fund-raising strategies will make campaigns less beholden to wealthy donors or private interest groups.

Volunteer Mobilization, Community Building, and Voter Engagement

Using digital campaign strategies to bring together a mass number of volunteers first occurred in 1998 when Jesse Ventura's gubernatorial campaign organized a 72-hour final drive through the state entirely via e-mail. Since then, online videos, social networking, candidate Web sites,

and mobile technologies have made it easier for campaigns to recruit and mobilize voters. Digital campaigns provide centralized locations through which campaign messages can resonate with potential volunteers, offline events can be organized, volunteers can post photos and testimonials of their experiences, and new volunteers can be recruited. Online volunteer mobilization has resulted in thousands of offline events being planned, volunteer groups being created, and millions of phone calls to potential voters being made through virtual phone-banking platforms. Political campaigns have capitalized on the use of digital tools to energize volunteers and engage them in event organization, grassroots fund-raising, and vote building.

Much in the same ways that campaigns have recruited and managed volunteers, digital tools have been used to build a sense of community among supporters. Using digital strategies, such as text message alerts, the ability to watch campaign speeches from mobile apps, behind-the-scenes photos and videos, and updates from official campaign blogs, have moved campaigns past simple e-mail blasts and created the sense of community with supporters. The use of social networking groups, hashtags, mobile apps, airing of campaign videos on YouTube, and the ability to check in at rallies through social media all work to make supporters feel like an integral part of the campaign community. The key way to accomplish community building is through capitalizing on the experience of being involved with the campaign, which can ultimately turn campaign supporters into voters. Through employing these techniques, digital campaigns have been successful in harnessing and mobilizing volunteers, building substantial online communities, and increasing voter engagement.

Gathering Data and Targeting Voters

Digital campaigns are also a very effective method through which to collect data about potential voters. Through data mining, microtargeting, voter-file targeting, and social media analysis, campaigns can learn about voters' online behaviors, voting trends, and the key issues resonating among certain demographics and develop the most effective strategies for cultivating relationships with these potential voters. Through a combination of

demographic and behavioral targeting, campaigns can use information about individual voters to drive recruitment and increase persuasion and turnout. Campaigns have deployed such sophisticated digital listening strategies that they can customize digital messages using social networking capabilities and use geo-targetable options to deliver ads within their voters' districts, targeting advertising almost to the individual level. Digital campaigns track each potential voter with such detail that they know once he or she has cast a ballot and then turn their attention to last-minute deciders.

Challenges of Digital Campaigns

While online tactics are essential to contemporary digital campaigns, there are inherently challenges that accompany them. The ease with which Web sites can be created and the speed at which social media posts and user-generated videos can become viral can make it difficult for campaigns to control candidates' images, keep talking points from becoming distorted, and keep the voters on point with the campaigns' messages.

This requires campaigns to manage and attempt to control both what is occurring in the mainstream media as well as what is happening in the digital environment. The fragmentation of the Internet can also make it difficult for campaigns to get and keep the attention of potential voters. With so much information and so many sites through which voters can choose to engage, retaining voters' attention and translating that attention into action, such as donations or votes, can be difficult. Finally, regulations regarding Internet campaigning lag far behind the constantly developing functionalities of the digital environment, potentially making it difficult for campaigns to know what is permissible in digital campaigns.

Conclusion

The Internet environment and digital campaign tools have already significantly impacted political campaigning and elections. These tools have revolutionized how analysts, candidates, and citizens think about and deal with politics. Digital campaigns have altered the ways in which candidates and campaigns interact with voters, substantially impacted campaigns' fund-raising

abilities, and fundamentally changed political campaigning. As online technologies and the digital environment continue to change and evolve, so too will the ways in which these technologies are integrated into political candidates' overall campaign strategies.

Campaigns, E-Mail

The use of e-mail in campaigns is one of the many digital communication tools enabled by Internet technology. E-mail, short for electronic mail, is a method used to exchange messages across the Internet or computer networks. In the context of political campaigns, e-mail is an efficient way for politicians to connect with large numbers of voters as message production and distribution is both quick and inexpensive. Although slow at first to emerge in the realm of electoral politics, e-mail has become a standard strategy for voter outreach. Typically used to supplement other communication

strategies, e-mail is now prevalent in virtually every campaign at all levels of government.

E-mail messaging involves asynchronous communication between a sender and a receiver. This means that an immediate response is not necessary for ongoing discussion. To engage in communication via e-mail, connection to an Internet server is only required for as long as it takes to send or receive a given message. This communication style is convenient for political campaigns because it allows them the capacity to distribute content at any time during the day. Unlike other media that require audiences to be present and engaged during the time of message distribution, e-mail technology offers senders and receivers the flexibility of attending to messages at times and locations that are most convenient for them.

The dramatic impact of Internet communications was recognized during the 2004 election. Candidates such as Howard Dean—who famously employed an array of digital tools to raise money and generate national support during the presidential primaries—used Web-based platforms such as Web sites and e-mail to connect with voters. In particular, the campaigns of presidential candidates George W. Bush and John Kerry sent hundreds of millions of e-mails in their efforts to recruit volunteers and solicit donations. Since 2004, the use of e-mail in elections has increased significantly as billions of e-mails were sent during the 2012 election.

There are several strategies that campaigns employ to generate massive lists of citizens' e-mail addresses. While an individual may actively contact a campaign requesting to be on an e-mail list, it is more common for the campaign to reach out and request information from voters. Campaigns strategically feature space throughout their literature that allows readers to provide their personal contact information. When visiting a campaign Web site during the 2012 election, it was not uncommon for visitors to be automatically redirected to a Web page that asked the users to enter their e-mails and zip codes before continuing to the Web site of the candidate.

Larger campaigns with sufficient funds may also employ the assistance of professional services that specialize in managing digital voter contacts. For example, Barack Obama's 2012 re-election campaign worked closely with the company Blue

State Digital to develop and manage tens of millions of voter contacts in an e-mail campaign that engaged more than 13.5 million individual supporters. Professional e-mail services assisted 2012 candidates with crafting specific language to be used in an e-mail's subject line that would most effectively appeal to voters. In an effort to more successfully connect with individual citizens, digital professionals also helped campaigns micro-target e-mails to specific audiences. Knowledge of demographics and other personal information associated with individual e-mail addresses was crucial in allowing campaigns to send smaller and more specialized batches of messages to particular audiences.

E-mail is an effective form of campaign communication for several reasons. It can be used to increase fund-raising efforts, to better organize and mobilize volunteers, and to advertise less expensively. E-mail technology also provides an incredibly quick method for campaigns to react to media coverage or attacks from political opponents. Unlike other media messages that require considerable amounts of time and organization for production and distribution, campaigns can quickly craft and disseminate e-mail to mass audiences. For example, on October 16, 2012—the evening of the second televised presidential debate between candidates Mitt Romney and Barack Obama—vice presidential candidate Paul Ryan sent an e-mail on behalf of the Romney campaign with the subject “Mitt crushed it” just moments after the debate formally ended. The timeliness of this message was important because it immediately assured recipients of the e-mail that, despite opposing opinions being projected by Democrats, political pundits, and journalists, the Romney campaign was confident that their candidate had been victorious in the debate. The ability to quickly distribute messages via campaign e-mail allows candidates a measure of control for framing themselves and their opponents in the midst of the media frenzy and mudslinging that often accompany major elections.

In modern elections, e-mail exists as an integral part of a political campaign's integrated marketing communication strategy as it supplements the strength of other media. By announcing campaign events and featuring interactive hyperlinks to other sources of relevant digital

President Barack Obama hugs First Lady Michelle Obama following the third presidential debate with Governor Mitt Romney, at Lynn University in Boca Raton, Florida, on October 22, 2012. Immediately following the second debate, Paul Ryan famously sent out an e-mail on behalf of the Romney campaign with the subject "Mitt crushed it." The message was intended to reassure supporters that despite opinions to the contrary by Democrats, political pundits, and the media, their candidate had "won" the debate.

information, campaign e-mail can function as a doorway through which voters can connect with the campaign and find other more engaging ways to support a candidate. In 2012, it was common for campaigns to feature hyperlinks throughout their e-mails that would direct readers to a campaign's official Web site, where they were exposed to a wealth of additional information about the candidate. Hyperlinks to other digital platforms such as blogs, social network sites, and other digital media were also frequently embedded in campaign e-mail as a way to attract voters to these different forms of campaign communication.

Campaign e-mail often appears to come straight from the candidate. However, campaigns also rely on other influential persons to send messages on their behalf. During the 2012 election,

e-mail from the presidential campaigns included messages sent from vice presidential candidates Joe Biden and Paul Ryan as well as the candidates' campaign managers, their digital directors, and their wives. Drawing on a range of senders was effective because particular messages can be more influential when sent by a particular person. In addition to political elites who sent messages on behalf of candidates, voters were encouraged to use the simple process of forwarding e-mail to spread campaign communication to their friends. E-mail forwarded by friends can exist as an effective means of connecting with voters because citizens are more likely to read, and perhaps be persuaded by, an e-mail that is sent by someone they know personally.

There are many qualities of campaign e-mail that make it a powerful platform for mediating

campaign communication. However, it is important to acknowledge the difficulty in assessing the direct effects that an e-mail may have on its recipient once it is sent. E-mail is easily deleted or ignored, and even when data regarding deliverability rates, open rates, and click-through rates are available, it is complicated to measure the degree to which a given message may or may not have impacted an individual reader. Further, once an e-mail is sent, the campaign loses control over to whom it is forwarded and how its content is used. Despite these drawbacks, the broad use and emphasis on e-mail in past elections suggests that this form of campaign communication will remain an important element of candidates' digital strategies.

Campaigns, Grassroots

A grassroots campaign is a planned activity organized to mobilize public support to bring pressure on legislators, government officials, or

corporations. Grassroots activities refer to public relations from the ground up, created by the people rather than targeted at the people. In politics, grassroots campaigning often becomes a public manifesto of sustained public advocacy efforts, indirect lobbying, or political activism. This form of political persuasion can be a highly effective way to alert legislators and elected officials about public concerns and spur them to action.

In recent years, the Internet and mobile technology have significantly altered traditional approaches for grassroots campaigning. Today, local activists and nongovernmental organizations (NGOs) should not solely rely on traditional media to amplify the voice of the people but actively embrace new strategies and tactics for citizen engagement.

The term *grassroots* can be traced back to Senator Albert Jeremiah Beveridge of Indiana, who once referred to the Progressive Party in 1912 as the party that "has come from the grass roots. It has grown from the soil of people's hard necessities." The U.S. suffragists' campaigns and the Civil Rights and Anti-Vietnam War movements of the 1950s and 1960s set up a model for contemporary grassroots activism. Most activists embrace grassroots campaigning as a means to influence public policy, social norms, and values. Grassroots campaigns can be orchestrated by grassroots organizers or even lobbyists seeking to educate, organize, and engage constituents to contact public officials in order to affect public policy. Their efforts are successful because campaign participants are viewed by politicians as potential voters for a competitor in the next election. In the United States, grassroots lobbying has become the fastest-growing area in the political persuasion business largely due to the provisions of the Lobbying Disclosure Act of 1995. According to this document, grassroots lobbyists are not considered professional lobbyists and are exempt from registration with the secretary of the Senate and the clerk of the House of Representatives as well as from disclosing estimates of the organization's total lobbying expenditures.

Traditional grassroots activities may take the traditional forms of organized letter writing to the local legislator, gathering signatures for petitions, raising money from small donors for political advertising or campaigns, canvassing, attending

rallies, toll-free phone lines, small group meetings, interviews with key public officials, and others. Another popular tactic is the use of telephone trees, which involves groups of constituents calling their networks and asking them to contact the office of the lawmaker with a common request or purpose. Due to limited resources, activists often use a variety of inexpensive outreach scenarios such as local press coverage, word of mouth, and political rallies to bring about social change and influence government decisions.

During the Ban Bus Campaign, an activist tour through 24 U.S. cities, intended to educate Americans about the problem of land mines and influence them to write letters to the U.S. government, the campaigners were able to build grassroots support of the anti-land mine treaty due to increased media coverage, demining performances on the streets, photography exhibits picturing landmine casualties, as well as student and veteran involvement, and so on.

Pseudo-grassroots campaigns, also known as astroturfing, are often fabricated to affect public opinion. This kind of artificial grassroots action imitates public advocacy efforts started by individuals or local communities and often withholds information about the source's financial connections. Many online astroturfers use software to mask their identities. In 2003, "grassroots" letters favoring Republican Party policies appeared in local newspapers around the United States, when signers were electronically submitting prewritten letters from a political Web site that offered petitioners points for sending a letter to a local paper. Another classic example of astroturfing is the campaign mounted in 1994 by the Coalition of Health Industry Choices to lobby against the Clinton administration's health care reform plan. Aside from other means, they engaged in an aggressive media campaign featuring Harry and Louise, a middle-aged couple who complained about the plan.

Recent Actions

The 2008 Barack Obama campaign demonstrated the advantages of social media for political activism, citizen engagement, and fund-raising. The Brookings Institution Center for Technology Innovation highlighted direct advantages in using social media to improve campaign engagement and

reinvigorate American democracy. For instance, social media increased the public responsiveness and accountability of both parties.

A new model of civic engagement was created that blends traditional media with social media, where ordinary citizens can become agents of persuasion and leverage their personal networks for various political causes. Most citizens now use their inner circles as trust filters to evaluate political information. Unless political advocacy groups become trusted members of these networks, they will not be able to engage the public and influence the course of electoral events. Increased media attention to the political agendas of independent bloggers and advocacy groups have given ordinary citizens more prominence and voice in national debates. Social media have also enriched political conversation, which allows people to reach to the bottom of the story when they evaluate the information about candidates and policy ideas. During elections, candidates are now forced to answer questions coming directly from grassroots networks.

In 2010, a study by the public relations firm Burson-Marsteller found that nearly all of the 34 examined advocacy groups, including the Association of American Retired Persons (AARP), the Human Rights Campaign, and National Taxpayers Union, use at least one social media platform to communicate their views on specific federal legislation and regulation with stakeholders. New social networking sites have significantly enhanced grassroots strategies and tactics for public outreach and community engagement.

In 2011, an individual petition on Change.org asking Bank of America and its Chief Executive Officer Bryan Moynihan to drop its unexpected new \$5 per-month banking fee for debit card customers attracted the support of 300,000 signatures. When President Barack Obama signed the petition and U.S. Senator Richard J. Durbin responded to Bank of America and the petition on Twitter, it prompted Congress to look at legislation for out-of-control banking fees. In 2012, various organizations, including Tumblr, Reddit, Twitter, and Fight for the Future organized a highly visible protest against the proposed Stop Online Piracy Act (SOPA). This action involved 115,000 Web sites, with Wikipedia going dark for 24 hours, causing 3 million people to e-mail the U.S. Congress

to express their opposition to the bill. As a result, congressional leaders shelved the proposed legislation until finding a better solution to online piracy and protection of intellectual property.

Hashtag Politics

Smartphones and mobile technology help activists to access their social networks on the go. What's now being called "hashtag politics," according to Duncan Meisel, has changed the political landscape, giving grassroots activists from both political parties a new way to share their views and gain followers. A label called a hashtag, which combines a # symbol and a key word that connect posts from different users, is an established convention for organizing ideas on Twitter. Like a frame, a hashtag organizes and amplifies public conversations.

The role of the organizer practicing hashtag politics is to organize the conversation around a topic hashtag and then curate the conversation to draw more supporters. Every day, Twitter evaluated and weighed the sentiments of tweets mentioning both Barack Obama and Mitt Romney relative to every other message that passed

through Twitter's systems. The system then calculated a score for both candidates. Tanya Kappo (@Nehiyawskwew) and her followers started the "#idlenomore" hashtag in support for the event Idle No More to address the Canadian First Nations people's objections to provisions in Bill C-45, which was seen as part of a broader agenda to impose legislation on aboriginal people without their consent. The hashtag went viral after her followers started tweeting about other indigenous issues. Soon National Chief Shawn Atleo and others called for a march to Parliament, which drew some serious media attention. Although the hashtag did not stop the bill, it showed aboriginal people that they can influence their leaders through grassroots social media campaigns.

Cost-Efficient Fund-Raising

Social media helps advocacy organizations to cut down on overhead and operating costs for organizing grassroots campaigns. It is also reducing the need for both paid and volunteer staff. By looking into available resources within their own networks, grassroots campaigners can mobilize people, raise money, and promote programs in

Protesters gather against the proposed Stop Online Piracy Act (SOPA) and the PROTECT IP Act (PIPA) in New York on January 18, 2012, as part of a series of organized events and protests. The grassroots effort had 115,000 Web sites and prompted 3 million citizens to e-mail their congressional representatives in opposition. The bills were removed from further voting two days later.

a more expedient manner. Traditionally, online fund-raising, describe Dick Armey and Matt Kibbe, can be done in the form of e-mail solicitations that direct people to a Web site, money bombs to raise a lot of money in the same day, static donation buttons on Web sites, and fund-raising campaigns for specific events or efforts.

However, social media may also provide independent platforms for like-minded people to connect and collaborate; they lay the foundation for massive, internationally connected grassroots movements. Social media consultant Laura “Pistachio” Britton used Twitter to raise \$25,000 in a week, leveraging her contacts and her contacts’ networks. Asking each of her Twitter followers—all 44,000 of them—to donate \$2 each, Pistachio got enough response and enough public retweeting, or republishing, of her request to raise \$25,000 for CharityWater.org. The Twestival, the largest global grassroots social media fund-raising initiative, took place in more than 200 cities in Europe, Asia, and America simultaneously, and raised \$1.2 million in 14 months for 137 non-profit organizations.

In societies with increased government control over political participation and traditional media, social media can be viewed as a “balancing force,” according to Marco Skoric and colleagues, to the traditional media. The possibility for success increases when skilled, networked individuals create a “community of concern” around crowdsourcing platforms that emerge as bottom-up grassroots initiatives. As perceived government control of the traditional media drives citizens to generate more political content on social media, their political efficacy and self-confidence become stronger. Interestingly, such political attitudes and skills acquired online can later translate into active, real-life participation in political activities, such as election rallies.

It has become much more difficult for governments to block information and stifle collaboration. On the other hand, by enabling ordinary citizens to monitor data and directly contribute to the formation of policy, open source governance helps continuously improve transparency and state accountability to its citizens and correct poor performance. In 2009, when gambling machines were declared illegal in Russia, driving gambling underground, explain Josh Machleder

and Gregory Asmolov, a student of the Saratov University of Technology created the platform www.gdecasino.ru to map illegal sites in the city. The founder then mobilized other users to map their own neighborhoods and cities. The map became the basis for activists to write complaints to the local police, leading to the closure of at least seven gambling dens. In March 2011, Russian President Dmitry Medvedev referred to www.gdecasino.ru to show the map of illegal gambling sites on his iPad to the Russian chief prosecutor as proof of the weaknesses of Russian law enforcement.

Crowdsourcing

In the past decade, crowdsourcing has been used to organize protests, report on poor government performance, track aid flows, or even find mayoral candidates. The organization Uncaucus in Rhode Island approached the mayoral election not only as an opportunity to elect a worthy candidate but to get many residents involved as a collective hiring manager. Their social media outreach made the election discussion public and accessible to a wide range of participants. Blow the Whistle, a campaign to expose a senator who manipulated congressional rules to thwart the Whistleblower Protection Enhancement Act, combines crowdsourcing with traditional grassroots political activism.

In an attempt to ferret out the anonymous senator who killed the bill, the campaigners published the contact information for all 87 active U.S. senators, and challenged listeners to contact representatives to ask point blank, “Did you kill this bill?” Due to e-mails from hundreds of participating listeners, 55 senators publicly stated that they were not responsible for the secret hold. After reconvening in January, the Senate voted 92–4 in favor of reforming the rules for secret holds, making it harder to use them to sabotage the legislative process. Ushahidi, a popular incident-reporting system that combines elements of Twitter and Google Maps, documented many incidents that escaped the mainstream media coverage in the aftermath of the disputed 2007 presidential elections in Kenya. Ushahidi has been deployed to monitor elections in Mexico and India and attacks on immigrants in South Africa and worked as a mutual aid coordination platform during unprecedented wildfires in

Russia. By providing visualizations and monitoring implementation of relief and recovery efforts, crowdsourcing proved to have a strong impact in developing countries, according to Maja Bott and Gregor Young, allowing for wide dissemination of weather and crop market price information (e.g., Mali, Uganda), crowdfunding microcredit (e.g., Kiva.org), and so on.

The attributes of the Web 2.0 era, such as digital transparency, increased Internet literacy, and real-time public engagement, have changed grassroots campaigning. More than ever before, grassroots campaigners have opportunities to give voice to the underresourced and powerless through low technological solutions. Small organizations and individuals are no longer dependent on resources once available only to governments and large corporations. Today's citizens can choose what news they want to receive and whose political agendas to propel forward through their own social networks. The best political advocacy organizations become members of online citizen networks; learn their cultures, languages, and needs; and utilize multimedia resources to drive civic discussions.

Campaigns, Organizing

Over the last decade, the use of social media has increased dramatically, and political candidates have taken notice. In 2008, Barack Obama became the first presidential candidate to employ a comprehensive social media strategy; the

then-Democratic presidential nominee used social media to raise record-breaking sums of money, organizing a nationwide group of volunteers and disseminating his campaign message. The 2012 election demonstrated that social media is now a crucial part of presidential campaigns, and increasingly, congressional campaigns. Although social media has not obviated the need for traditional campaign activities, such as television advertising and door-to-door canvassing, it has drastically changed the way that campaigns raise money, communicate their messages to voters, and mobilize voters prior to Election Day.

Evolution of Social Media in Campaigns

Although Obama is often credited with introducing social media into political campaigns, many aspects of his social media strategy were modeled on the efforts of Vermont Governor Howard Dean, who unsuccessfully campaigned for the 2004 Democratic presidential nomination. Key to Dean's meteoric, albeit temporary, ascendancy to front-runner status was his successful use of the Internet site Meetup.com; the site was designed to connect local individuals sharing common interests, in this case shared support of the Dean campaign. At the start of the campaign, in mid-2003, Dean had only a few hundred supporters on Meetup.com; by the end of his campaign in February 2004, the campaign could boast more than 600,000 supporters on the site.

In 2008, then-Illinois Senator Barack Obama employed a hybrid campaign strategy during his Democratic primary race against New York Senator and former First Lady Hillary Clinton as well as during his general election campaign against Arizona Senator John McCain. Specifically, Obama melded traditional campaign activities with social media activism; central to this effort was Obama's Web site, www.myBarackObama.com. The site was designed by Facebook cofounder Chris Hughes and allowed Obama supporters to donate money, access information about the candidate, and volunteer for phone banks and door-to-door canvassing.

Although McCain did eventually incorporate social media into his campaign, Obama vastly outpaced him in this regard. By Election Day, Obama had 844,927 friends on Myspace, compared to McCain's 219,404 friends. In addition,

on Twitter, Obama had 118,107 followers, while McCain had only 4,942 followers. Although Obama's social media presence was not the sole factor for his eventual election victory, it was key to his ability to raise vast sums of money and mobilize young supporters.

By the time of the 2010 midterm elections, the number of Americans using social media had grown significantly. Overall, in this election, 22 percent of adults reported that they used social networking for political engagement. In addition, 11 percent of adults indicated that they followed a political candidate on Twitter or Facebook.

The demographics of social media users had begun to change as well; although younger individuals had dominated social media, in this election, older voters began using social media in greater numbers. Specifically, 33 percent of users above the age of 50 used social networking for political activity during this election. In comparison, in the 18 to 29 age group, 42 percent of users reported that they used social networking for political activity.

During this cycle, Republican congressional candidates adopted many of the approaches of the Obama campaign; social media was especially important for the Tea Party movement, which supported Republican candidates who adhered to their small government, antitax principles. FreedomWorks and American Majority, two umbrella organizations for the movement, hosted conferences to train Tea Party activists in online campaign techniques. These efforts paid off, and a Pew study found that, during this election cycle, Republicans were more likely than Democrats to use social media for campaign activities. Specifically, 40 percent of Republicans used social media for campaign activities, compared to 38 percent of Democrats.

Some commentators dubbed the 2012 presidential election the "social media election." Both Obama and his Republican opponent, former Massachusetts Governor Mitt Romney, had a significant presence in social media, communicating with voters through Facebook, Twitter, and YouTube. Although Romney made social media a centerpiece of his campaign, hiring Zac Mofatt, cofounder of the digital advertising firm Target Victory as his social media director, the Obama campaign again proved to be more successful at

using new media. On Twitter, the Obama campaign averaged 29 tweets per day, while the Romney campaign averaged just one. In addition, the Obama campaign posted twice as many videos on YouTube as did the Romney campaign.

In the future, it is likely that social media will be an essential part of presidential and congressional campaigns. Voters are increasingly relying upon the Internet to gain political information; according to one survey, during the 2012 election, 82 percent of U.S. adults expected to receive most of their political news online. In accordance with this, Americans now expect elected officials to use these mediums as well; the same survey found that 62 percent of respondents expected political candidates to have a social media presence. Although using social media is not a guarantee of electoral success, candidates who fail to adapt to the new digital environment will be at a significant disadvantage.

Social Media and Fund-Raising

The clearest way that social media has changed campaign organizing is in the area of fund-raising; the advent of social media has led to a vast increase in online fund-raising.

Traditionally, campaigns have relied on a network of wealthy donors who were able to donate the maximum of \$2,500 to a candidate, as permitted by federal law. In addition to large donations from individuals, candidates also received contributions from bundlers; here, prominent supporters collected donations from multiple individuals before bundling the contribution and donating it to the candidate. Another way campaigns raise money is through fund-raising events, for example, a dinner with the candidates or other party luminaries. Donors pay fees to attend the dinner; at the national level, the fee is often several thousand dollars per plate.

Although presidential and congressional candidates still engage in these traditional fund-raising activities, candidates have recently begun to solicit donations online, with many campaigns deriving a majority of their funding from online donations. In 2004, the Dean campaign was the first to demonstrate the value of small donations from a vast network of dedicated supporters. During his run for the Democratic nomination, Dean raised \$20 million on the Internet; 44 percent of those

donating online were first-time political donors. Moreover, donors to the Dean campaign were also individuals who had not previously volunteered for a political campaign.

In the 2008 election, Obama replicated this approach. Overall, his campaign raised a record-breaking \$756 million; \$500 million of this money was from online donations. In addition to soliciting individual donations, the myBarackObama.com Web site also allowed Obama supporters to set up their own individual fund-raising sites and request donations from friends and family. In total, more than 70,000 Obama supporters set up individual fund-raising pages. Like Dean supporters in 2004, donors to the Obama campaign tended to give small but frequent donations. Specifically, the average online donation for Obama was about \$80, and 40 percent of Obama's online donations were less than \$200.

Social media has not only vastly increased the sums of money raised by candidates but has also allowed campaigns to use technology and data mining to devise targeted fund-raising appeals. For example, during one part of the 2008 election, the Obama campaign tested several thousand unique fund-raising e-mails. In order to assess the effectiveness of each e-mail, the campaign would first send it to a subset of donors. Individual e-mails that proved most effective in soliciting donations would later be sent to the full list of potential donors. Overall, e-mail solicitations are far less costly than traditional mail solicitations, which cost approximately 20 cents for every dollar raised.

The ability of presidential candidates to raise vast sums of money online may have broad reverberations, ending the public financing of presidential campaigns. Pursuant to the Federal Election Campaign Act, the federal government provides an optional grant of money to each general election candidate to pay for valid expenses; in exchange for the grant, the candidate accepts a limit on overall campaign spending. From 1976 through 2004, all general election candidates accepted public financing. In the 2008 election, due in part to his ability to raise vast sums of money online, Obama declined the \$84 million in public funding; he became the first presidential candidate to opt out of public financing for the general election. McCain, however, did accept

public financing; the Republican found himself at a significant disadvantage, with Obama outspending him by a margin of two to one. Subsequently, in the 2012 election, neither Obama nor Romney elected to accept public financing.

Fund-raising through social media is especially effective for underdog or insurgent candidates, who unlike presidential candidates, may lack party support or public visibility. For example, Ron Paul, a congressman from Texas, used online fund-raising to sustain his long-shot candidacy for the 2008 Republican presidential nomination. Specifically, Paul would request that his online supporters detonate money bombs by rapidly raising large sums of money. In November 2007, despite single-digit support in national polls, Paul managed to raise \$4.3 million in a single fund-raising drive. In December 2007, he set a fund-raising record by raising \$6 million in one day.

Online fund-raising was also crucial in the January 2010 special election in Massachusetts to fill the U.S. Senate seat held by Ted Kennedy, who died in August 2009. In the race, Republican State Senator Scott Brown faced off against Democrat Martha Coakley, Massachusetts attorney general. Although Coakley was favored in the heavily Democratic state and enjoyed an initial fund-raising advantage, Brown was able to rapidly raise funds online. In a period of 18 days in January 2010, he raised \$14 million in online donations; this included a single-day fund-raising drive that yielded more than \$1 million. Brown went on to win the election, garnering 52 percent of the vote, compared to 47 percent of the vote for Coakley.

Social Media and Voter Outreach

Successful campaigns must translate fund-raising dollars into effective voter outreach, gaining the attention and support of voters. Here, campaigns seek to create favorable pictures of the candidates by disseminating both biographical information and policy positions. Reciprocally, a campaign seeks to create unfavorable images of the opponents, using opposition research to highlight unpopular policy positions or personal scandals. To accomplish these tasks, campaigns have typically devoted a large percent of the campaign budget to direct mail as well as television and radio advertising.

Social media has added a new layer to these outreach efforts, and the Internet has become a key destination for campaign advertising; candidates now post both Web videos and static ads with links to relevant Web sites. In 2012, both Obama and Romney employed digital advertising agencies to oversee their online efforts. In total, Obama spent \$52 million on digital ads, while Romney spent \$26.2 million. Some of the most popular destinations for digital ads were Facebook, YouTube, and Twitter.

These Web advertisements were often distinct from the candidates' television advertisements. For instance, when announcing his 2012 campaign theme, "Forward," Obama released a seven-minute Web-only ad that recounted the successes of his first term. Obama also used Web-based advertising to disseminate negative information about Romney. The campaign released a six-minute advertisement focusing on the plight of workers who were laid off after Romney's venture capital firm bought their employers. This was an expanded version of a two-minute television ad that the Obama campaign ran in swing states.

Online commercials can be produced and posted quickly and, in 2012, proved to be an effective way for the candidates to rebut their opponents. After the second presidential debate, the Romney campaign posted a Web advertisement that collected instances of Obama mocking Romney; this was juxtaposed with Obama stating that he intended to conduct a campaign based on issues, not personal attacks. Similarly, after the first presidential debate, widely judged to be a decisive victory for Romney, the Obama campaign released a video highlighting various misstatements by the Republican candidate.

Overall, Web-based ads have rapidly become a staple of campaign advertising; in 2012, there were six times more online ads than there were in the 2008 election. Despite the growth in online advertising, television still remains the dominant medium for campaign advertising, and only about 2 percent of campaign spending in the 2012 presidential election was devoted to online advertising.

Social media and technology have also impacted the way that campaigns undertake direct mailing operations. Increasingly, campaigns are abandoning generic direct mail communications and instead using data mining to develop mailers targeted at

specific demographic or ideological groups. In addition, these mailers often contain links to a candidate's Web site, highlighting areas of interest to that voter. The campaign can then gather data on how often these Web sites are accessed. Some mailers also contain quick response (QR) codes, which voters can access with smartphones.

Social Media and Voter Mobilization

In addition to the "air war," namely the effort to sway voters through television advertising, campaigns also rely on the "ground war," with members of the campaign contacting individual voters and encouraging them to turn out on Election Day. Campaigns employ two primary methods to encourage turnout: door-to-door canvassing and phone banks. Voter mobilization is predicated upon personal communication between the campaign and voters, and campaigns are increasingly turning to social media sites to recruit volunteers to engage in these mobilization activities.

In 2008, the Obama campaign's "ground game" was vastly superior to that of his rival, with the Democrat boasting more offices in battleground states and disciplined teams of seasoned campaign professionals. A key component of that success, however, was Obama's army of unpaid campaign volunteers, many of whom were recruited through social media sites. Beginning in 2007, the campaign sent these volunteers to Camp Obama and, by late summer, had trained more than 1,000 individuals in get-out-the-vote (GOTV) techniques. As a result, the Obama team was able to begin voter mobilization efforts even before paid staff had arrived in many states.

Throughout his campaign, Obama continued to recruit volunteers through social media sites. One million Obama supporters signed up for e-mail alerts and were willing to participate in voter mobilization activities when contacted by the campaign. This permitted the Obama campaign to expand its focused GOTV efforts beyond the 72-hour model successfully used by Republicans in 2000 and 2004. Specifically, the Obama campaign conducted intense GOTV activities during the three months prior to the election.

The ability to recruit volunteers online had a discernible effect, with Obama outperforming McCain in voter contact. Nationwide, 26 percent of voters reported that they were contacted

by the Obama campaign, compared to only 18 percent who reported being contacted by the McCain campaign. In many swing states, the gap was much larger. In Nevada, 50 percent of voters were contacted by the Obama campaign, compared to 29 percent who were contacted by the McCain campaign; in Colorado, the Obama campaign contacted 51 percent of voters, while the McCain campaign contacted 34 percent. Obama won both of these states in 2008; during the 2004 election, both of these states had gone to Republican George W. Bush.

Future of Social Media and Campaigns

Although it is impossible to assess the degree to which a well-crafted social media strategy improves a candidate's electoral prospects, the last two presidential elections demonstrate that it is now an essential part of any national campaign. Since the 2004 election, social media has proved to be a key tool for fund-raising, communication, and volunteer recruitment.

Social media clearly present many opportunities for candidates; it contains significant risks as well. As a bottom up medium of communication, individual social media users are empowered to create and upload content; this content can then go viral and dominate political discourse, drowning out official communication from any campaign. This was much in evidence in September 2012, when a video of Romney speaking at a private fund-raiser went viral. In the video, the Republican presidential candidate stated that 47 percent of the population supported Obama because they expected to receive government aid from his administration. The video, uploaded by an anonymous YouTube user, received 1.6 million views in a single day, and the subsequent scandal was covered heavily in television and print media. Earlier in the campaign, Obama had also experienced the downside of social media, when conservative bloggers seized on a line from a speech, in which the president seemed to suggest that small businesses owed their success to the government. The quote became a political meme, and the Romney campaign eventually incorporated it into stump speeches, making it a focus of the Republican convention in August.

As these examples demonstrate, social media is serving to democratize discourse in political

campaigns, diminishing the role of the news media and elected officials as authoritative sources of political information. Although political candidates have successfully harnessed social media as a campaign tool, its ultimate effect is to change the manner in which elected officials interact with voters. For instance, a recent study found that more than 90 percent of the members of Congress had Twitter accounts, catering to an electorate that is increasingly tech savvy. Although social media is unlikely to ever fully replace traditional campaigning, its usage will undoubtedly increase in future election cycles.

Campaigns, Presidential (2000)

The 2000 presidential election in the United States will always be remembered for two reasons: First, the election's outcome was not actually decided until a month after the vote was held,

and second, it paved the way for online involvement in national campaigns in the years to come.

In one of the most contentious presidential races ever, George W. Bush was declared the winner over Al Gore when a recount in Florida gave Bush the state by a mere 537 votes. While the election is memorable for its unprecedented postelection recounts and the involvement of the U.S. Supreme Court, it is also noteworthy for the multiple ways in which it laid the groundwork for subsequent shifts in the role played by social media as well as online political venues. Although presidential candidates had already proven that Web sites were of interest to some voters—both Republican and Democratic candidates had sites as early as the 1992 election—in 2000, the presidential campaigns boosted their online presence and included interactive elements to help recruit volunteers and donors.

By 2000, more Americans were going online, and about 104 million adults accessed the Internet looking for election information. Some researchers noted that the Internet seemed to be assuming a role similar to that played by talk radio because it gave people another platform through which to express their opinions. It also provided ways for Americans to have personal contact with presidential campaigns, which in the past had been reserved mainly for the party faithful.

Much of this was done through the respective campaigns' Web sites, which were more interactive than in previous campaigns. For instance, the Gore–Lieberman site offered a way for a visitor to the page to select a state and type in a list of volunteer activities he or she was willing to do. That information was then sent to officials in that state so that the volunteer could be assigned campaign duties. The Bush–Cheney Web site had a link to multimedia, which allowed visitors to see short video clips of the candidate talking about campaign issues.

Although campaigns during both the primaries and the general election recruited volunteers through their Web sites, they were also interested in raising money online. Candidate Bill Bradley asked the Federal Election Commission (FEC), which oversees federal elections, if federal candidates could process credit card and debit payments from donors. The FEC ruled that online credit card contributions to presidential candidates were

eligible for federal matching funds. This began the now-common process of soliciting contributions online through Web sites and social media outlets. Senator John McCain's campaign raised more than \$6 million online during the 2000 election, setting a bar that would easily be shattered in the coming years. But, for a country in which (at that time) only 132 million people had online access, it was no small feat.

During the 2000 election, there was no Twitter or Facebook. However, there was America Online (AOL), which featured chat rooms, conference rooms, and auditoriums. These virtual rooms were places that members could go online to chat with other people, to play games, to debate topics, or just to share information. AOL actually began in 1988 as AppleLink, a joint project of Apple Computer and a company called Quantam Computer Services. The idea was to find a way to connect Apple II and Macintosh computers. The early chat rooms that were developed in this project could only hold 23 people at one time. The software was refined and enlarged, and it became a chat program called People Connection. It was later renamed America Online. In January 2000, Time Warner and AOL announced that they would be merging. The companies completed the merger and became AOL Time Warner in 2001, a deal that was destined to fall apart later in the decade.

By 2000, there were 29 million people subscribing to AOL. This was the height of the company's popularity, and it coincided with the presidential election. According to a Pew Internet and American Life report, about 30 percent of Americans said that they used commercial services such as America Online in 2000 as their primary source for election news. Younger people were more likely to visit chat rooms to discuss the election, while older voters were more likely to participate in online polls.

Studies have found that people who go online to participate in campaigns increase their political activation. In other words, if they spend time online discussing the campaign or election issues, they tend to be more active in political issues and in their communities. In 2000, AOL wanted to be the hub of online political participation. It had already been through the 1996 presidential and the 1998 midterm elections and noted that members were interested in political topics.

During the 2000 election, AOL debuted Election Guide 2000, an online election site for voters that provided local voter guides, virtual candidate debates, issue charts, and a Presidential Matchmaker feature that matched voters and candidates on certain issues. More than 20 million families visited the site, and 165,000 people registered to vote through the site. This endeavor, which was done in cooperation with CBS News, earned AOL an honorable mention in the 2000 James K. Batten Awards, which recognize excellence in civic journalism. The site featured rolling online chats with all of the presidential candidates and virtual debate halls in which a variety of federal, state, and local candidates could participate and speak to their potential voters.

AOL and the candidates were not the only organizations working to identify people with an interest in the election. It has been noted that virtual organizers in the 2000 election began to locate people with common interests and move them toward identifying with one particular candidate. This was made easier through online sites that not only provided information but also allowed for

George W. Bush in Concord, New Hampshire, signs paperwork to become a presidential candidate in the 2000 election. Bush and running mate Dick Cheney later released a Web site with links to videos of Bush speaking on campaign issues.

feedback and real-time chats. In this way, political activists began to build communities of people who shared common interests and were trained in how to organize and network online. President Bill Clinton's Summit for America's Future was an example of an organization that worked to train volunteers in how to organize groups of people and mobilize them for political action. It brought together a wide group of people to encourage volunteerism among Americans.

The seeds sown by political activists during the 2000 election led to the involvement of several online organizations during the 2004 campaign and grassroots support for organizations such as MoveOn.org. In 2000, MoveOn launched an Internet discussion forum that provided a way for members to give feedback to the organization. In 2004, MoveOn paid for the airing of several anti-George W. Bush ads and raised \$750,000 for ads targeting Bush's military record.

Senator John McCain turned his attention to grassroots organizing early in his 2000 campaign. His campaign, as noted above, raised a significant amount of money through its Web site. The site provided ways for people to get involved in the campaign with the thought that involvement would lead to donations. After McCain won the New Hampshire primary, he raised \$300,000 overnight through his Web site. There was so much traffic on the site that it became temporarily unavailable.

The McCain campaign made use of online chat rooms with donors and even disclosed information about how money would be spent. McCain was the first candidate to raise \$1 million online in only 48 hours.

The 2000 presidential election paved the way for the more interactive, involvement-oriented online political campaigns that emerged in 2004 and especially in 2008, when then candidate Barack Obama raised \$500 million online and declined to take any federal matching money for his campaign. Although the opportunities were more limited, Americans went online to listen, discuss, and learn about the candidates. They also registered their support through online volunteer efforts, donations, and discussions in chat rooms. Although the 2000 presidential election predated the existence of "social media" as they are known today, it established a new relationship between

candidates and their public based on an increasingly dynamic, interactive approach to online media that opened the door to easy acceptance of social media's role in subsequent elections.

Campaigns, Presidential (2004)

The 2004 presidential campaign did not feature social media as it is known today. Facebook was still in its infancy, and Twitter did not even exist. The year did mark, however, a seminal moment in American politics for the influence of the Internet in campaigns and elections, both in terms of how candidates connected to voters and how voters interacted with one another. The Internet and its social dimensions also featured prominently in campaign strategy and were a leading factor in driving several important events during the campaigns. In short, the 2004 presidential campaign demonstrated the importance of the Internet for contemporary American electoral politics and

pointed in the direction of the growing influence social media would play in elections to come.

During the 2004 presidential campaign, three out of 10 Americans used the Internet to interact with the election. Among active Internet users, 52 percent used the Web to get news or information about the election. These numbers represented a sharp increase from previous election cycles. In 1996, only 4 percent of the American public turned to the Internet for election information, and in 2000, that number was 18 percent. Similarly, only 22 percent of Internet users used the Web in 1996, with that number climbing to 33 percent in 2000. Clearly, 2004 captured the growing influence of the Internet in informing American voters. The reasons for this increase are many but include growing familiarity and experience with using the Web, an increase in Web content and news in particular, and the increasing availability of broadband network connections making connecting to the Internet faster and more stable.

What is even more striking about 2004 is how Americans used the Internet to engage with the election. Among those who used the Web for election information, 34 million researched candidates to inform themselves about where the candidates stood on important issues. In addition, 32 million people received or sent jokes or comments through e-mail about the election. Another 18 million people reported taking part in online polls and surveys. Also, 16 million people visited Web sites run by various organizations to check on endorsements or ratings of candidates. Almost 6 million people joined chat groups to engage in political discussions and debate. Finally, 4 million people contributed money to candidates and campaigns online.

Surveys also captured the fact that the time voters spent on the Internet affected their political opinions and vote choices. Among voters receiving political news from the Internet, 52 percent reported that the information they were able to obtain online helped them to structure their vote choices. Another 27 percent said that online information influenced them to vote either for or against a certain candidate. Moreover, there was also evidence that online political information influenced political participation. Also, 23 percent of survey respondents reported that online

political information positively impacted their decision to vote.

In terms of partisanship, Democratic voters appeared to be more active in obtaining online political information than Republicans. Supporters of John Kerry were more likely to send and receive e-mails about the election, track opinion polls about the candidates, research endorsements and ratings by interest groups, and participate in online polls and surveys. Kerry voters were also more likely to get involved in online discussions and debates, contribute money online, and believe that the Internet played an important part in shaping their vote preferences.

Attacks on Candidates

The Internet and social media, especially blogs, impacted the 2004 election in other ways. In every campaign, there are inevitable gaffes and attacks on candidates, but in 2004, the Internet gave added power to these events that, for periods of time, defined the campaigns and likely torpedoed the candidacy of one contender in the Democratic primary. After a subpar performance during the first debate, President George W. Bush was criticized by the mainstream media for appearing awkward, unprepared, and uncomfortable answering questions. Soon after, however, blog sites on the Internet reported that photographs from the debate allegedly showed a suspicious bulge inside of the president's jacket. Speculation soon ran rampant that Bush was wearing a radio receiver and that someone had been feeding him answers to the debate questions. This scenario supposedly explained a bizarre moment during the debate in which the president complained about being interrupted even though no one had been talking at the time. The Bush campaign, apparently unaware or unconcerned with what was being said on the Internet, was slow to respond to the allegations, and the suspicion trailed his campaign for several weeks.

The Internet played an even greater role in sabotaging the candidacy of Howard Dean, who was challenging John Kerry for the Democratic nomination. Dean had enjoyed an improbable rise as a potential candidate and looked well positioned to finish strong in the Iowa caucuses. Despite his momentum, Dean finished a disappointing third behind John Kerry and John Edwards. Undaunted

by the poor showing, Dean delivered a speech to supporters in which he intended to sustain their enthusiasm for his candidacy. While the exact cause of what came next is unclear, Dean appeared to finish his speech with a throaty scream. On the Internet, the event was quickly dubbed the “Dean Scream” and the “I Have a Scream” speech. Edited videos soon appeared on the Web attaching the scream to music soundtracks and mocking captioning. Blog sites regurgitated the story for days and helped create the impression that Dean was unhinged and lacking the temperament to be president. The event, and the Internet sensation that followed it, soon led to Dean withdrawing his candidacy.

During the general election contest, two other events were significantly influenced by social media and the Internet. During the fall campaign, questions were raised about whether President Bush had fulfilled his duty requirements while a member of the Air National Guard. As the story grew, CBS news ran a story supported by documents from the late Lt. Col. Jerry B. Killian, Bush’s squadron commander. The documents claimed that Bush had received preferential treatment during his time in active service and that Killian had been encouraged to obscure the fact that Bush was not fulfilling his duties. After CBS ran the story, an Internet blogger, Harry MacDaugald, alleged that the documents used by CBS were fakes. His analysis of the documents purported to show that that were written with fonts and formatting styles that were not in existence when the memos were supposedly composed. Other bloggers took up the fake documents story until CBS was forced to conduct an internal investigation into the story. The news organization concluded that the documents could not be authenticated and admitted that they should not have been used.

Finally, John Kerry came under attack from a group calling itself the Swift Boat Veterans for Truth (SBVT). The group launched a series of attacks on Kerry’s candidacy, calling into question his fitness to serve as president. Among the allegations made by the group, Kerry was accused of lying about atrocities committed by U.S. soldiers in Vietnam, embellishing his own service record, and accepting undeserved combat medals. When SBVT’s allegations first surfaced, they were bolstered by bloggers and message boards that spread

the group’s attacks throughout the Internet. This speedy dissemination of the story helped contribute to almost one in three Americans believing that there was at least some truth to the allegations. In addition, like the Bush radio receiver story, the Kerry campaign was slow to respond to the attacks and was apparently unaware of how quickly the story was spreading across the Internet. Many analysts would later attribute this failure as a major factor in Kerry’s election defeat.

Dean Campaign Innovations

The 2004 presidential campaign also demonstrated how social media and the Internet would play major roles in campaign activities in the future. Ironically, it was Howard Dean, a man whose candidacy was undone by social media, who demonstrated the potential for social media

Howard Dean speaking at a September 26, 2006, Democratic National Committee event. Dean’s presidential run came to an end shortly after what became known as the “Dean Scream” or the “I Have a Scream” speech, after he hoarsely finished his speech with a loud “Yeah!” Video parodies appeared online.

to benefit political campaigns. One area where Dean clearly highlighted the potential for social media assistance was in fund-raising. When Dean began his campaign for the presidency, he possessed little cash, almost no staffers, no visible constituency, and a single campaign office in Vermont. Dean soon hired a campaign manager, Joe Trippi, who wanted to utilize the Internet to overcome these deficiencies. To fill the need for cash and resources, Dean and Trippi devised an innovative fund-raising strategy that defined short-term goals for donors to maximize motivation to contribute. The campaign focused on current news stories about the opposition candidates to build immediate momentum for fund-raising. The strategy was an extraordinary success. During the height of the primary season, Dean had increased his cash resources to \$40 million, boasted a staff of more than 400 people, and had opened numerous campaign offices in 24 states.

Dean and Trippi utilized social media Web site MeetUp.com to bolster popular support for his candidacy. MeetUp.com assisted individuals in arranging get-togethers according to shared interests. Harnessing the Web site's networking potential, the Dean campaign soon built an Internet community of supporters numbering in the hundreds of thousands. The organization allowed the campaign to transmit important information to supporters, build its fund-raising base, and direct activists to spread the campaign's message to new voters in diverse areas. The social networking effort was so successful that members continued organizing even after the collapse of the campaign.

Another innovation employed by the Dean campaign was the use of blogging. The campaign began its Blog for America and eventually posted more than 2,900 entries while receiving more than 30,000 comments. The blog provided another opportunity for the campaign to direct the activities of campaign loyalists, gave Dean supporters a venue to network and socialize, and created a broad social network to draw ideas for campaign activities and messages. The blog also enhanced Dean's fund-raising opportunities and was credited as a key component in his fund-raising success. That being said, the blog was also frequently plagued by technological problems that frustrated both campaign staffers and visitors.

Given his early cash-flow problems, Dean had initially considered accepting public financing for his campaign. The problem with public financing, of course, was that it would place stringent limits on the amount of money the campaign could raise. As the fund-raising problems reversed themselves, Dean began to reconsider the public financing option. His concern, however, was that the decision could alienate supporters. To gauge this potential problem, the Dean campaign pioneered the use of the online referendum. Simply put, Dean put the public financing question before his supporters and allowed them to vote on how he should proceed. His supporters overwhelmingly endorsed forgoing the public option, which gave Dean the cover he needed to abandon his earlier decision. Dean supporters voting yes to rejecting public financing were then sent personal messages and requests for donations. The online referendum thus revealed itself to be a powerful tool for candidates to evaluate the support of their constituents and to provide legitimacy for controversial decisions.

Other Uses

The Kerry and Bush campaigns also relied on the Internet and social media to enhance their election efforts, but neither did so to the extent of the Dean campaign. Building on Dean's fund-raising success, Kerry, along with the Democratic National Committee, used the Internet to build a substantial campaign war chest. Internet fund-raising allowed the campaign to raise more than \$122 million in contributions. Republicans harnessed the power of social media in other ways, focusing instead on voter mobilization. The Bush campaign combined the time-tested grassroots voter turnout strategy with an Internet-based organization strategy. Like the Dean campaign's use of MeetUp, the Bush campaign used the Internet to organize team-building sessions with supporters around the country. These sessions focused on tactics and strategy and even featured appearances by the first lady and the president. More than 30,000 such sessions would eventually take place, involving more than 350,000 people.

The 2004 presidential campaign was not a total victory for social media because many of its most powerful technologies were not yet in existence. Nevertheless, the election demonstrated the

growing influence of the Internet and social media in American elections and how candidates must be able to harness this technology to win the elections of the future.

Campaigns, Presidential (2008)

Social media in political campaigns came of age during the 2008 presidential election. The campaign of Barack Obama best embraced Web 2.0 tools to transform the notion of campaigning nationally and virtually. The 2008 election can be seen as the beginning of the Internet age in political campaigns. Social media were useful not only for facilitating the distribution of campaign messages, but they also provided utility as a mechanism for continuous and ongoing political engagement by citizens reached by particular messages.

Forty-seven-year-old first-term Illinois Senator Barack Obama defeated Senator John McCain of

Arizona, who was from a previous generation, with physical disabilities from his time as a prisoner of war in Vietnam, and was said to have not even used a typewriter, let alone text messages. Obama's 365–173 electoral college win (53–46 percent in the popular vote) was fueled in part by a successful social media strategy.

Obama's campaign used the Internet to advertise, communicate, and organize. It also aired its positions and defended against attacks. There were close to 500 million blog postings about Obama from the start of the Democratic National Convention in August in Denver to Election Day. During the same period, there were around 150 million blog posts that mentioned McCain.

On Myspace, Obama had 844,927 friends compared to 219,404 for McCain. In the last two days of the campaign, Obama gained more than 10,000 new friends, while McCain gained around 964. Obama had about 200,000 Myspace friends in January 2008 when the primary campaign started. Obama's Twitter account had 118,107 followers, gaining 2,865 on November 3 and 4. McCain's Twitter account had 4,942 in total. Obama's campaign let followers know where he was every step of the campaign trail. It was updated multiple times a day with messages in the first person so that followers felt a personal connection to the candidate himself. It also included live video streams of his public appearances. Obama would occasionally personally type messages, which would be signed with his initials *bo* to authenticate.

It was well known that Obama was an avid BlackBerry user throughout his campaign. When he became president, his use of the personal and presidential BlackBerry devices had to be limited. Through Election Day, Obama's Facebook fan page had more than 2.5 million fans and many secondary groups with thousands of supporters. Students for Barack Obama was created in July 2007 to energize young voters, and campaign staffers eventually made it an official part of the campaign. By contrast, McCain had around 620,000 Facebook supporters. More than 5.4 million Facebook users clicked on an "I Voted" button to let their friends know they had performed their civic duty.

There were various applications for smartphones that allowed Obama supporters to share

quotes, speeches, and inspirational messages. A YouTube channel, "BarackObamadotcom," had more than 120,000 subscribers and 1,800 videos by election time. There were more than 18 million channel views for Obama compared to 2 million for McCain on YouTube. Two million people created profiles on his Web site My.BarackObama.com.

One explanation for the disparity in numbers is that the early users of social media more closely resemble the profile for Democratic voters than for Republicans, especially in terms of age. This was expected to change in subsequent campaigns as all candidates and consultants realized the importance of social media strategies.

Not only could candidates reach supporters through a variety of sources, but they could also tailor their messages on each social network. Candidates and campaigns used social media to try to connect with constituents. Companies use those same spaces to post ads and try to reach targeted groups of customers.

Obama Campaign

The Obama campaign revolutionized the use of social media sites for campaigning and fund-raising purposes. It picked up where 2004 Democratic presidential hopeful and former Vermont Governor Howard Dean left off with online fund-raising. Dean's campaign is credited with starting to systematically collect online donations during his unsuccessful 2004 run.

The Obama campaign took it to a new level when it had more than 3 million online donors making more than 6.5 million donations. The average online donation was \$80, and 6 million of the donations were in increments of \$100 or less. The average donor gave money more than once to the campaign. These figures allowed the Obama campaign to raise the most money of any campaign in history and from the most total donors. One result of Obama's phenomenal fund-raising ability was that he declined matching public funds, becoming the first candidate to do that since the system was set up in 1976.

Obama raised online more than \$100 million of the \$150 million haul in September 2008. A large chunk of it came after Sarah Palin's acceptance speech at the Republican National Convention (RNC), where she disparaged Obama's

background as a community organizer saying, "I guess a small-town mayor is sort of like a community organizer, except that you have actual responsibilities." The Obama campaign raised \$10 million over the next 24 hours.

Obama easily exceeded his Democratic primary challengers online. His social media presence was stronger than Hillary Clinton's. Obama had more than 250,000 Facebook members during 2007 compared to 3,200 for Clinton. Meanwhile, Clinton faced resistance from a "Stop Hillary Clinton" Facebook site, while Obama enjoyed dozens of supportive groups.

In early 2007, Joe Rospars was hired to direct new-media efforts. Rospars had worked for Dean's 2004 campaign and for the Democratic National Committee. He was joined by Social Media Director Chris Hughes, a Facebook cofounder. They created a team of experts known as Triple O—Obama's online operation. They formed My.BarackObama.com (MyBO) to create groups, organize events, raise funds, and have supporters connect with one another. More than 2 million profiles were created by supporters, 200,000 offline events were planned, about 400,000 blog entries were posted, and more than 35,000 volunteer groups were created. At least 1,000 groups were created the day Obama announced his candidacy on February 10, 2007.

On MyBO, the campaign built a database with 13 million e-mail addresses, 6.5 million online donors, 2 million members of their social network, and tens of thousands of engaged activists. Obama raised more than \$600 million and much of it was online. Supporters were encouraged to set up their own grassroots finance committees on MyBO. More than 70,000 people raised \$30 million from their family and friends. Around 3 million phone calls were made in the final four days of the campaign by supporters using MyBO's virtual phone-banking system.

One key advantage for Obama was the use of the Internet to organize in caucus states. He won the main caucuses in his primary contest against Hillary Clinton among other Democratic challengers. Winning the Iowa caucus and then in other caucus states throughout the primary season propelled Obama to the Democratic nomination. The use of text messages to reach younger voters was a key component of Obama's strategy in Iowa.

Barack Obama's Facebook fan page had more than 2.5 million fans in 2008. Many secondary group Facebook pages were created and had thousands of followers, including "One Million Strong for Barack" and "Students for Barack Obama."

Team Obama used YouTube to post many ads that reached voters for free. It was estimated that the campaign's official materials were viewed for a total of 14.5 million hours online for free. It would take \$47 million to buy that much time in broadcast television advertisements.

Kate Albright-Hanna ran Obama's video team. She left CNN to work on the campaign, led a team that shot more than 2,000 hours of footage from Obama campaign events, and uploaded 1,100 videos on Obama's YouTube channel. Obama's videos were viewed nearly 52 million times, compared to 9.5 million for McCain's online videos. The Obama campaign videos also had a "Contribute" button conveniently located on the channel that enabled supporters to donate to the campaign using Google Checkout.

Obama's campaign could reach different demographics through targeted social networking sites. It communicated with Baby Boomers on Eons.com, Latinos on MiGente.com, African Americans on BlackPlanet.com, and gays and lesbians on GLEE.com. Flickr and YouTube were used to spread the campaign's themes of hope and

change. Digg, Eventful, Faithbase, MyBatanga, and AsianAve all had an Obama presence. Obama was dubbed the Social Networking King by the *Washington Post*. Facebook pages like "One Million Strong for Barack" and "Students for Barack Obama" met potential voters where they were already spending their time.

In September 2007, then-candidate Obama went on the business networking site LinkedIn to connect with white-collar voters. He asked a discussion question: "How can the next president help small business and entrepreneurs to survive?" It received 135 answers by the next morning. Obama and Republican candidate Rudy Giuliani were the first candidates to have profiles on LinkedIn. Obama was the first to have a LinkedIn group.

The Obama campaign collected voter contact information at its thousands of events by asking attendees to send a text message to 62262 (the numeral spells the word *Obama* on a phone). Sometimes, they were asked to send the word *HOPE* or to send their names, zip codes, and comments during debates. Scott Goldstein ran the text messaging operation. At a campaign event with Obama and Oprah Winfrey in Columbia, South Carolina, the crowd was asked to text "S.C." to 62262. In the following weeks, the people who responded were sent text messages asking them to make phone calls or volunteer to urge people to vote in the January 26 primary. Obama won the South Carolina primary by 28 points over Hillary Clinton. In exchange for some personal information, people were placed on the campaign mailing list. Those folks then got campaign updates and reminders. They were the first to learn through text message that Obama selected Delaware Senator Joe Biden as his running mate.

The night Obama accepted the Democratic nomination at Invesco Field in Denver, of the more than 75,000 people in the audience, more than 30,000 used phones to text and join the program. Supporters received an average of five to 20 text messages per month depending on their demographics and where they lived. They received three reminders on Election Day to go out and vote.

According to Obama 2008 Campaign Director David Plouffe, a goal of the campaign was to expand the size of the electorate by reaching

first-time voters among minorities and youths. They collected 13 million e-mail addresses, sent more than 7,000 differently targeted messages, and more than 1 billion total e-mails throughout the campaign to reach these voters. By comparison, Democratic nominee John Kerry's campaign had 3 million e-mail addresses in 2004, and Howard Dean's had 600,000.

When Obama was attacked for his relationship to Reverend Jeremiah Wright, who made controversial comments from the pulpit, he gave a speech on race relations in Philadelphia on March 18, 2008. The speech was eventually watched by more than 7 million people on YouTube.

Another role that changed in the 2008 campaign was that citizens could use the Internet to instantly fact-check statements by politicians and share their findings quickly and widely. One example was when vice presidential candidate Sarah Palin said she opposed the so-called bridge to nowhere in Alaska. But, when records showed that she previously supported it and the news spread around on social media sites, then the McCain campaign stopped saying it.

On the other hand, offhanded comments by candidates at seemingly friendly and private events can be recorded and cause trouble along the campaign trail. Obama made a comment at a San Francisco fund-raiser that some people in western Pennsylvania cling to their guns and religion and see immigrants as different from them. The audio was used by conservative commentators to stir up opposition to Obama and to show that he held disdain for heartland, blue-collar Americans. While Obama's Facebook page had musical and pop culture interests that appealed to the social media generation, complete with shorthand language, McCain's use of social media did not appeal to young or tech-savvy voters.

McCain Campaign

The McCain campaign had a modest online presence compared to the Obama campaign. McCain did not fully embrace the potential of social media in the way that Obama and his supporters did. McCain had a handful of staff members dedicated to social media efforts and hired an outside firm to do additional work. They created a networking site called McCainSpace, but it did not gain popularity. McCain's social network numbers

were far surpassed on Facebook, Myspace, Twitter, and YouTube, as noted above, by the Obama campaign.

Vice presidential nominee and Alaska Governor Sarah Palin was a spirited user of social media. But, the campaign needed her to moderate her use so that she did not overshadow the Republican nominee. A rumor about Palin and her family emerged through social media and required the campaign to respond. The rumor was that Palin's daughter Bristol was actually the mother of Palin's 4-month-old baby. The McCain campaign needed to respond to correct the record that the 4-month old was indeed the governor's baby. In the meantime, it became known that Bristol, an unmarried teen, was pregnant.

Supporters Weigh In

One common perception of the major party campaigns is that Republicans tend to run top-down organizations with more closely controlled channels of information. Democrats are more comfortable ceding control to people outside of the formal party leadership hierarchy. This enables Democrats to be more open to outside involvement by supportive groups.

A comedy network called Barely Political created ObamaGirl and released several videos, in which Amber Lee Ettinger showed her enthusiastic support for Obama. One video released in June 2007, called "I Got a Crush on Obama," was viewed more than 10 million times before the campaign ended. It became a national sensation and gave a lighthearted look at the popular obsession with Obama. A sexily dressed Ettinger danced and gushed over the Illinois senator in a pop love song platform (the song was sung by Leah Kauffman). The video was named the number three meme of the decade by *Newsweek* and the top Web video of the decade by Webby Awards. Other videos included "Obama Girl vs. Giuliani Girl," "Super Obama Girl," and "Ralph Nader and Obama Girl." The videos were featured on all the major cable networks. Ettinger appeared on *Saturday Night Live* and was named the Hottest Girl on the Internet in 2008.

Another video unaffiliated with the campaign called "Yes We Can," complete with powerful music and lyrics established an online anthem for Obama. The song, performed by the musician

Will.i.am, was edited to appear like candidate Obama was performing with Will, who echoed words spoken by Obama in campaign speeches. Several celebrities made cameo appearances in the video. It became a theme and rallying cry for supporters; it went viral and was viewed by millions. The “Yes We Can” video captured the enthusiasm of the MTV generation and demonstrated the power of the Internet in helping a candidate appeal to diverse populations.

These and other campaign aids on social media led Obama critics and the McCain campaign to deride Obama for his celebrity status. The attacks only seemed to help reinforce Obama’s credibility online and his popularity in social media. The celebrity ad boomeranged on McCain when one of the celebrities, Paris Hilton, made her own video in which she denounced McCain, while sitting in a bikini, and announced her own tongue-in-check run for president.

Obama had a chance meeting with Samuel “Joe” Wurzelbacher, “Joe the Plumber,” on the campaign trail in Ohio. Obama said he wanted to “redistribute the wealth” in a polite disagreement with Wurzelbacher, and the comment was caught on camera and went viral. Joe the Plumber became a common name for a common person who might be harmed by Obama’s planned economic policies. Joe the Plumber, who was not actually a licensed plumber, was mentioned in the first debate 23 times by McCain and Obama. From there, interest in Joe the Plumber and use of him as a campaign pawn by both sides intensified.

Social Media as Sources of Information

A Pew survey released in January 2008 showed that 24 percent of Americans said they regularly learned political information from the Internet. That was double the 13 percent who said the same thing at a comparable point in 2004 and three times the 9 percent reporting from 2000. This was especially noteworthy for young people. Forty-two percent of 18- to 29-year-olds said they regularly learned something about the campaign from the Internet, up from 20 percent in 2004. While the percentage of people learning something about the campaign was down slightly on local television news and nightly network news, it was at similar levels for cable news networks and daily newspapers between 2004 and 2008.

The main sources of Internet-based news information in 2008 were MSNBC.com (26 percent), CNN.com (23 percent), and Yahoo! News (22 percent), followed by Google News (9 percent) and Fox News (9 percent).

A survey conducted by Complete and released by Cisco found that 62 percent of respondents regularly used the Internet as a source of information during the 2008 campaign. Television was cited by 82 percent in the survey as a source of political news. The use of online videos was five times greater than in 2004, with around 30 percent of registered voters reporting that they viewed videos online to follow the 2008 elections, and 75 percent of those viewers finding that online videos helped them to follow news and events about the presidential race more closely.

One academic study in the *Journal of New Communications Research* found that the coverage of the main candidates in social media was more equal in volume compared to traditional media. They found that, from September 8 through November 3, Obama was mentioned 160,207 times in traditional media, followed by McCain at 143,611, Palin at 84,714, and Biden at 20,834. In social media sites, McCain was mentioned 275,780 times, followed by Obama at 271,400, Palin with 270,266, and Biden at 266,523. While there was parity in the number of mentions online, this does not provide a measure of whether the coverage was positive or negative or the context of the coverage.

The same study found the American economy was mentioned 204,258 times in traditional media. That far outpaced Iraq at 86,458, Afghanistan at 66,774, and Iran at 34,316, with Joe the Plumber at 8,176. In social media, Iraq was the most-mentioned topic at 280,473, then Iran at 130,015, Afghanistan at 125,650, Joe the Plumber at 46,178, and the American economy at 16,191.

Conclusion

Rather than engaging in retail politics and going door-to-door to meet voters, social media allow candidates to go directly to citizens at a time and place of their choosing and usually in a network where they feel comfortable communicating and sharing information.

The 2008 election has been referred to as the Facebook election. It was the first time that all

major congressional and presidential candidates used social networking sites to connect to voters. Social media sites also made connections with traditional media outlets to expand their reach. Facebook held joint efforts with ABC News for election coverage and political forums. YouTube teamed up with CNN to use video questions from citizens during one of the presidential debates.

While it is clear that candidates used social media to reach voters and rally supporters, what is less certain is what impact they had on the election results. Though the 2008 Obama campaign is heralded as a path breaker for its use of new media and social networks, there is no way to know how many votes that translated into on Election Day. There are several reasons why Obama won, including national fatigue with Republicans after eight years under George W. Bush, the record amount of money that Obama raised, and his change message that he pushed. Social media aided in political socialization efforts as well as in quick and relatively inexpensive communication and organization. Based on the experience of the 2008 campaign and with the rapidly changing pace of technology, it was expected that the impact of social media in the 2012 campaigns would be profound.

Campaigns, 2012

Social media were a common and important part of the 2012 presidential and congressional elections. By 2012 it was an expected part of the election process for campaigns to launch social media messages and to use their online presence as a way to influence voters and traditional and cable news coverage. President Barack Obama's re-election campaign set the hallmark for the use of social media in the campaign even as Republican challenger Mitt Romney's team did a competitive job in social networking. One of the reasons cited for Obama winning re-election is the changing electorate and Obama's ability to win with younger voters, and especially women, Hispanics, and Asian Americans. Each of these groups is an important social media user demographic cluster, and the Obama election strategy mirrored that technology use profile.

One of the most-visited sites, especially during the last few weeks of the campaign, was the *New York Times*-hosted blog fivethirtyeight.com by Nate Silver. A Nielsen study found that Hispanics had higher usage rates of mobile and social media than whites, and Hispanics and African Americans have adopted Twitter at faster rates than whites. More than 60 percent of African American, Asian American, and Hispanic women have smartphones, compared to 33 percent of white women. People were clearly connected and getting more information than ever about candidates and campaigns. It is unclear whether

that translated into votes or not. It certainly does allow the campaigns to reinforce their messages and give more reminders about voting at minimal cost. For example, in Virginia, the Obama campaign was texting volunteers to make sure voters stayed in line even after polls closed.

A comment by Romney was secretly captured on video at a fund-raiser in Boca Raton, Florida. Romney said, “There are 47 percent of the people who will vote for the president no matter what. All right, there are 47 percent who are with him, who are dependent upon government, who believe that they are victims, who believe the government has a responsibility to care for them, who believe that they are entitled to health care, to food, to housing, to you name it—that’s an entitlement.” The 47 percent comment was unearthed by *Mother Jones*, a liberal magazine, and went viral.

After the campaign, the country faced a so-called fiscal cliff as tax breaks were set to expire, and a debt ceiling limit vote was required. President Obama called on citizens to tweet members of Congress to urge them to act on the expiring tax cuts and debt ceiling.

In 2012, Obama had more than 1.7 million friends on Myspace. He had more than 29 million “likes” on Facebook, while Romney had nearly 8 million. On Instagram, Obama had 1.4 million followers, while Romney had 38,000 people with which to share campaign photos. For music aficionados, on Spotify, 14,654 subscribers could keep tabs on Obama’s musical interests, while 402 knew Romney’s favorite songs.

The YouTube channel BarackObamadotcom had more than 290,000 subscribers and more than 288 million video views in December 2012. Romney’s YouTube channel had almost 29,000 followers and 33.6 million video views.

Pinterest sites by the candidate’s wives generated attention around some of their favorite activities. Michelle Obama showed pictures from events around the White House and had 42,000 followers. Ann Romney had 12,000 followers interested in her recipes and family.

Obama had more than 20 million Twitter followers compared to 1.2 million for Romney.

Twitter

Twitter emerged as the real-time tool of choice for candidates and campaigns in 2012. It allowed for

instant feedback, fact-checking, and conversation while events like conventions and debates were happening. Twitter, like many social networks, has the potential to bring both positive and negative attention to a statement or situation.

One of the highlights—or lowlights—of the instant communication tool was during the Republican National Convention (RNC). Legendary actor Clint Eastwood gave a speech prior to the introduction of nominee Mitt Romney. Eastwood, beloved for many tough-guy movie roles, spoke to an empty chair that he addressed as having President Obama seated in it.

Tweets were fast and furious during the actual presentation. Then, after Eastwood left the stage an Invisible Obama account was established on Twitter. It immediately had 6,000 followers. The hashtag #Eastwooding was prevalent on the site. Around 9:30 p.m., Obama tweeted a photo of himself in the Oval Office with the caption, “This seat’s taken.”

The following week, Obama’s Democratic National Convention (DNC) speech witnessed record levels of Twitter activity. There were 4

After Clint Eastwood spoke to an empty chair during a speech at the Republican National Convention, President Barack Obama tweeted a photo of himself in the Oval Office to his more than 20 million Twitter followers. Obama’s 2012 re-election campaign set a standard for using social media in political campaigning.

million tweets during the last day of the DNC, more than all three days combined of the RNC. In the moments after Obama's speech accepting renomination, there were more than 52,000 tweets per minute. There was no comprehensive report of how many tweets were positive or negative, but it is clear that the president generated online chatter.

The first presidential debate on October 3 between Obama and Romney had a memorable social media moment and surpassed the DNC as the most tweeted-about event in history. While describing what spending programs Romney would cut, he singled out the subsidy to the Public Broadcasting Service (PBS). Romney said, "I like PBS. I love Big Bird." But, Romney said he would not borrow money from China to pay for it. Immediately, Big Bird was tweeted 17,000 times per minute, and PBS was in 10,000 tweets per minute. Big Bird became the fourth-most-searched term that night. The comment led to several fake Twitter addresses being created, and #SaveBigBird was a topic trending worldwide.

Other blog posts and Tumblr images from *Sesame Street* followed. There were more than 10.3 million tweets about the first debate, more than the 9.5 million from the DNC, and 4 million during the RNC, according to Twitter. As for perceptions of the results, 25 percent of relevant tweets said Obama looked "rusty," while 22 percent said that Romney was "on his game." The conventional wisdom nationally was that Romney had a better debate performance. Yet, the thoughts on the candidates' performances were not followed by changes in attitudes on social media about their policy positions. Romney gained respect for his debate performance but did not earn noticeable support for his campaign in return.

The vice presidential debate on October 11 between Joe Biden and Paul Ryan drew 4 million tweets. The most tweeted-about moment was when Biden sarcastically asked, "Oh, now you are Jack Kennedy?" after Ryan tried to use the former president as an example of when tax rates were lowered and economic growth increased. The reference to Jack (John F.) Kennedy immediately brought to mind the infamous line that Lloyd Bentsen used on then-Vice President Dan Quayle in a 1988 debate. There were 58,275 tweets per minute after Biden's Kennedy comment. A line

by Ryan that the Obama administration was "caught with their hand in the cookie jar turning Medicare into a piggy bank for Obamacare" garnered 55,540 tweets per minute. The moderator, ABC News' Martha Raddatz, was also tweeted about her performance, and her Twitter following increased from 6,000 to more than 20,000 during the debate.

Obama (@barackobama) became the third person and the first politician to reach 10 million Twitter followers. (The first two were Lady Gaga and Justin Bieber.) Obama joined Twitter on March 5, 2007. It took four years, six months, and five days to reach the 10 million mark. Obama hosted a Twitter town hall meeting on July 6, 2011. It focused on education and economic issues that appeal to young people, such as student loan interest rates. Obama, who is known to be verbose, had trouble staying within the 140-character limit at times.

On Election Day, the Obama campaign promoted #VoteObama, and it was listed as the top worldwide trend. When clicked, the message read, "Election Day is here. Stand with Barack and confirm your voting location now: [OFA.BO/k3Qny](#) #VoteObama." The link sent people to a tool to help them figure out where to vote.

A picture of President Obama and his wife Michelle hugging after he won re-election became the most-tweeted photo of all time, with more than 500,000 retweets. One estimate showed that 90 percent of senators and House members had Twitter accounts as well as 42 governors and more than 35 world leaders. Democrats successfully took their message online, while Republicans appeared to rely more on television advertisements to reach mainstream voters.

Primaries

Early in the cycle, as around 10 contenders geared up to compete for the chance to challenge Obama, questions arose about the ability of Republican candidates to have successful social media strategies. Newt Gingrich had an early start on his competitors, having assembled a base of followers for his organizations American Solutions and Winning the Future. Gingrich, who announced his campaign on Twitter, had 1.3 million Twitter followers in late 2011, many times more than all of the rest of the Republican challengers combined.

A story broke that about 80 percent of his followers were fake either from inactive or dummy accounts, paid for by the Gingrich campaign.

Mitt Romney had about 1.15 million Facebook fans in late 2011, prior to the Republican primary and caucus season. Still, Romney's Klout score, a measure of online influence, was at 75, while Herman Cain's was at 80 and President Obama's was 88.

Herman Cain made a big splash as a Tea Party-supported candidate running for the Republican primary. A YouTube video with his chief of staff, Mark Block, went viral and gained attention for the campaign. Block spoke supportively about Cain, took a long drag from a cigarette, and blew smoke toward the camera. Cain, a former restaurant business executive, then appeared on the screen with a wide grin without saying a word. The video had 1.3 million views in less than a week and inspired several parodies. Cain's Twitter handle emphasized his personality @THEHermanCain.

Michele Bachmann, a Minnesota congresswoman and Tea Party favorite, took to social media to get her message out. In one Facebook comment, she jabbed one of her opponents: "Imitation is the sincerest form of flattery; thank you Governor Perry for using my ideas for your tax plan." The posting generated 931 comments.

Governor Rick Perry of Texas became the object of online ridicule after a gaffe made in a Republican debate. Perry said he would abolish three federal cabinet departments and then could not remember the third one.

Digital citizens got a different glimpse of Romney in his online profile than what they might have seen in the debates and speeches. He listed "likes" for *Modern Family*, *American Idol*, *Star Wars*, waterskiing, and horseback riding with his wife.

Obama Campaign

The Obama campaign already had a massive amount of social media data and contacts from the 2008 campaign and from his first term in office. One goal was the win back people who had unsubscribed from the 2008 e-mail lists. Another was to microtarget voters based on their interests or personal appeals to their favorite celebrities. When the campaign offered a chance for donors to win dinner with George Clooney and President

Obama, they found the people most likely to respond were females aged 40 to 49 on the West Coast. They sought someone with similar appeal on the East Coast, and rather than find a handsome, male movie star, they enlisted actress Sarah Jessica Parker. The fund-raising appeals were also varied to try to attack different demographics. Some were focused on Parker and her starring role in *Sex in the City*. Other messages pointed out that *Vogue* editor Anna Wintour would be present. Still others highlighted a private Mariah Carey concert after the dinner.

Other efforts to microtarget include the Obama campaign sending a fund-raising appeal to supporters but with several variations. One such mailing included at least six slight varieties in the same message, varying the amount of money asked for, the subject line, and the general appeal of the message.

The Obama campaign sliced the electorate into manageable pieces with very specialized interests. One constituency was dog lovers. The campaign ran pro-Obama Internet ads featuring Bo, the First Family's Portuguese Water Dog. The ads urged voters to "Bark for Barack" and to donate to the campaign. There were Pet Lovers for Obama pages on Facebook, Pinterest, and other social media sites with pictures of the president and Bo. Supporters were also encouraged to share pictures of themselves and their pets.

The campaign also had pet-themed products for sale on the Web site. Other goods targeted for segmented groups included Latinos, nurses, and young mothers, with a Babies for Obama outfit.

Obama for America and the Democratic Party released an iPhone app to allow campaign volunteers to find registered Democrats in their neighborhoods. Targeted addresses showed the names, ages, genders, and party affiliations of voters living there. While it raised some privacy concerns, the data was public information that is commonly used by campaigns. It is generally housed in campaign offices and passed out on paper. This app allowed volunteers to access the information without visiting campaign headquarters.

Romney Campaign

Romney's campaign did a good job of getting on various social media sites and trying to reach potential voters. Romney launched his presidential

bid in June 2011. The campaign claimed to have had 3.25 million visitors to MittRomney.com by January 2012.

The Romney campaign used a company called ShareThis to target people who spent time on the official Web site and to track them around the Internet. Users would then get links to learn more or to donate to the Romney campaign. The strategy was used to identify people who were interested in the Republican candidate, just like those used to find potential customers for a variety of consumer products.

Both parties and presidential campaigns used microtargeted ads based on Internet searches. Microsoft and Yahoo! sold information to campaigns to allow them to tailor ads. Google and Facebook representatives said that they were not using this political matching service.

One woman reported that, while she was listening to music on Pandora, an ad to assist the Romney campaign appeared on her iPhone screen. The ad said, “To help Mitt Romney become the next president, Romney for President, Inc. would like to use your e-mail address—tap OK to let Pandora share this info.” It had boxes for “No Thanks” and “OK” on the screen. The woman, who was listening to a Garth Brooks song when the pop-up appeared, took a screen shot and posted it on Twitter with the comment “#fail.” It was unclear if the woman received the ad because she lived in battleground state North Carolina or because of the type of music.

New Concerns

An issue that arose in this election was what could happen to voters who took pictures of their ballots and posted them on Instagram or another site. Many states have laws making it illegal to show one’s marked ballot to someone else. State laws vary across the nation on election procedures and penalties for violations. Laws vary from potentially having these ballots invalidated and the votes not counting to fines and imprisonment or both.

One person made a video of what he or she described as an attempt to vote on a faulty machine. A user named “centralPAvote” showed how he or she tried to cast a vote for Obama, but the machine kept registering for Romney. The voter then told officials, who recalibrated the

machine and fixed the error. The video gained more than 10 million views, several hundred thousand of them on Election Day. There were also video reports of machines making the opposite error in other states, when a voter tried to cast a vote for Romney but the machine read it as a vote for Obama. These individual, isolated instances fueled Internet stories that each side had officials trying to rig the vote in their favor. However, there were not widespread or systematic glitches.

Conclusion

The use of social media to promote one’s candidacy was not enough. They also needed to be used to organize and encourage people to act. With the profound role of social media in the 2008 and 2012 campaigns, observers were left to imagine what new platforms would come to transform the political scene in 2016.

Campaigns, Virtual

Virtual campaigns are promotional and marketing campaigns based upon new information and communication technologies (ICTs). Campaigns can be understood as a series of communicative activities in a set time period arranged by defined

strategies based on the targeted audience. Technological innovations and changes in the media and political culture have led to a modernization of political electoral campaigning. Political actors around the world adopted a wide array of Internet-based communication tools and embarked on virtual campaigning strategies. From the U.S. general election in 1996, when both major and minor party presidential candidates had Web sites, to Howard Dean's innovative use of the Internet for fund-raising and mobilization in 2004 and Barack Obama's extensive and effective use of the Web in the U.S. general elections in 2008 and 2012, politicians have increasingly sought to capitalize on the opportunities offered by ICTs.

Postmodern Campaigning

Internet technology has permeated the political process as political actors in both developed and developing democracies exploit new communication tools and utilize social networking such as Facebook and Twitter to achieve more efficient campaigns. Pippa Norris characterized this phase of political campaigning as postmodern campaigning, and Jay Blumler and Dennis Kavanagh have termed the media environment of postmodern campaigning the "Third Age of Political Communication." Virtual campaigning can sometimes be the one and only communication tool, as was the case in Poland in 2011. As a result of new laws that prohibited the use of traditional methods of promotion (such as billboards or television advertisements), political parties in Poland had to focus on the Internet for their 2011 parliamentary electoral campaigns.

Nevertheless, virtual campaigns still share the same goals as traditional campaigns. One difference is that they can now exploit the multimedia capacities of the Web. Campaigns are fundamentally about contacting and communicating with voters and targeted audiences, mobilizing the electorate, gaining supporters, and promoting the candidate, the party, or the platform. The ultimate goal of any political campaign is to persuade the electorate to vote for a particular candidate and party. What makes the use of ICTs important in political campaigning is that it has changed the pattern of political communication with new methods for generating content, enabling interactivity, using sophisticated promotional tools and

detailed and customized targeting of audience, and disengaging from mainstream media. However, it should be mentioned that virtual campaigning, in many cases, functions in conjunction with traditional campaigning.

Although the use of Internet technology in political campaigning is not new, its first uses were simplistic. Political Web sites were confined to candidates' biographies and speeches, campaign news, and position papers. The sites were not sophisticated and were less interactive. With advances in Web-based campaigning, political actors and their campaign consultants have novel and creative ways to contact and communicate with their public. E-mails, blogs, online chats, bulletin boards, newsgroups, interactive Web sites, instant messaging, and social networks have ensured interactivity, and in some cases have engaged participants in a synchronous exchange conversation environment.

Web message boards can be thought of as a hybrid between group e-mail lists and newsgroups. Similarly, with e-mail lists, Web message boards promote complicity and community building through interaction among the participants. Entry into this group of participants and viewing exchanges are determined by specific membership rules. Web message boards usually lend themselves to dynamic conversation on topics that involve relatively short responses.

The 2008 and 2012 U.S. presidential campaigns were examples of a creative and extensive use of new technologies such as Facebook, YouTube, Twitter, and Myspace, as well as Ning, Friendfeed, LinkedIn, and Google+. The Barack Obama campaign in 2008 created its own social networking site, My.BarackObama.com (MyBO), and the John McCain campaign followed with McCainSpace. Both MyBO and McCainSpace allowed individuals to create their own profiles, interact with others, donate funds, join groups, and arrange events. The Obama campaign took things even further and used the site to target voters and to organize its get-out-the-vote efforts.

Moreover, virtual campaigns can include the use of smartphone and mobile applications to create buzz. New tools include both iPhone and Android applications and short messaging service (SMS, or text). With a mobile app, one can have iconic placement on a person's phone and can

also create app alerts. Mobile applications run faster and create one-on-one messages directly to the user. Furthermore, iPhone and Android applications provide data on millions of voters and powerful analytics to campaign workers.

The dissemination and gathering of political information is crucially important in any political campaign. The ICTs allow users to find a lot of information in multiple ways. Political Web sites provide a variety of data and sources from the process of the political and electoral system to a calendar of campaign events, actions, and ways to participate. Furthermore, Web message boards, forums, chats, and social networking provide a communication platform for the exchange of ideas and information. This bottom-up interaction allows the participants to comment on the party's activities and provide suggestions. The opinions that are expressed in these communication activities along with the users' credentials that are registered in the candidates' sites are valuable data for the political actors.

Engaging Voters

In addition, virtual campaigns have also been very effective in mobilizing voters and enhancing people's engagement in campaigns. Being among the most popular politicians in Facebook, Barack Obama had registered 32,313,965 friends by Election Day in 2012. The Obama virtual campaigning strategy became a dominant mobilizing political force. Indicatively, the following are some interesting figures for Barack Obama's campaign as of his Election Day 2012: 22,112,160 Twitter followers of @barackobama, 2,304,851 Google+ followers, 2.2 million volunteers, and 382,000 blog posts using the phrase "Voting for Obama" between September 1 and November 4, 2012, according to Google search. Obama allowed and encouraged supporters to participate by posting videos, photos, and testimonials. Online structures in virtual campaigning enable individuals to mobilize other potential voters, participate in creating their own campaign material, and recruit users as campaign volunteers. By responding to followers in the social media, a candidate adds a human touch to the campaign and can more easily turn digital followers into real-world volunteers.

Web 2.0 also offered a very rich terrain for promotional campaigning. Modern Web sites

have photo galleries, video clips that cover events and speeches (sometimes available through live streaming), Really Simple Syndication (RSS) feeds, and in some cases, online structures that invite voters to create their own campaign material. Applications, such as the RSS, provide users with real-time information.

They also offer visitors the opportunity to download campaign paraphernalia such as electronic bumper stickers, ringtones, buttons, desktop wallpapers, and graphics (e.g., party logos, or posters). Moreover, YouTube, Google's popular user-generated online video-sharing service, has seriously affected online campaigning. YouTube enables political campaigners to upload a practically unlimited amount of filmed materials easily, at no cost, and without third-party mediation. The site, due to its popularity, facilitates high rates of exposure. The broad and successful use of Web 2.0 applications by Barack Obama set the example for other politicians too. In the 2009 elections for the 18th Knesset (Israeli Parliament), 22 of the 33 parties that competed had channels on YouTube, while there was a total of nearly 1,000 videos uploaded by these parties.

Virtual campaigning has enriched the traditional fund-raising mechanisms of politics. Online structures encourage voters' financial contributions to parties or candidates. In addition to the most usual link "Donate," many Web sites provided alternative choices such as "Sponsor a Media Ad." Among the best-known and most successful examples of Internet-based fund-raising and grassroots organizing is Howard Dean's campaign for the 2004 U.S. Democratic presidential nomination. Dean pioneered in Web fund-raising by raising \$27 million in total by online contributions during his campaign. His innovative use of Meetup.com in order to organize thousands of offline gatherings brought together nearly 200,000 supporters. The Obama campaign built on this tactic, and in the 2012 electoral campaign, he raised \$504 million online.

Challenges

Undoubtedly, Internet-based technology has brought forth new challenges for the political communication terrain. The effects of ICTs on political campaigning are at the epicenter of an ongoing debate in political science. There are

three main schools of thought: cyber optimists, cyber skeptics, and the reinforcement theorists or cyber pessimists.

Cyber optimists, or mobilization theorists, constitute the optimistic strand in literature on computer-mediated communication. They support that ICTs empower democracy by fostering greater participation, encouraging political conversation, improving interactive information sharing, and reducing costs. Political communication online is fast, easy, and inexpensive. On the other hand, cyber skeptics believe that the Internet has been overestimated as a medium for activating the citizenry and that it only supplements traditional political communication tactics, from which it differs only slightly. Finally, reinforcement theorists or, cyber pessimists, doubt the Internet's potential to increase political participation and to provide a new repertoire of collective action. Their argument is highly influenced by their belief that the Internet aggravates *de facto* differences in political participation. For them, new technologies reinforce deeper divisions between the "info-rich" and the "info-poor."

Despite differing opinions on the impact of ICTs in political communication and politics, the infusion of new technologies in campaigning techniques is an indisputable fact. Virtual campaigning benefits such as being lower in cost, eliminating geographical boundaries, and allowing an independence of media interests, and new, sophisticated methods of promotion and communication have proved invaluable. Apart from political parties and politicians, virtual campaigns have been deployed by other nonstate actors like nongovernmental organizations (NGOs), ethnic communities, trade unions, lobby groups, interest groups, and protesters.

Nonstate and other civil society actors make use of the aforementioned campaigning tools to raise public awareness of and put pressure on particular policies or political decision makers. Along with these action campaigns, many solidarity campaigns exist in support of moral and social issues like social justice or human rights. These actors use the advantages of ICTs to enhance their campaigns and render them more effective. They can provide large amounts of information on their Web sites and can also create and encourage online participatory forms of interaction. Many

Web campaigns with clearly defined demands have also included e-petitioning. E-petitioning is a very popular form of online political participation. Nonetheless, the role of e-petitioning in political and social Web campaigns has bolstered an ongoing discussion around its potentials and pitfalls. New technology can increase exposure to a wider audience and provide new methods for membership. The term *cyberactivism* is used to describe the use of advanced information and communication technologies for campaigns. Greenpeace, among other organizations, has used cyberactivism extensively, which has helped it revolutionize the way it runs its campaigns.

There are numerous examples of social groups that have used social media not only to organize but to make their voices heard. Social media and Facebook, in particular, have been instrumental in the creation, organization, and promotion of the Spanish movement Indignados, which protested against austerity measures. The same organizational and campaigning model built around network communication was adopted by similar movements like Occupy Wall Street and the Greek Indignant. Virtual campaign practices enable these movements to mobilize online and offline rallies, attract worldwide attention, and gain broader public support. The Internet environment is their battleground and ultimately their political weapon.

On the whole, virtual campaigns have heralded a new era in political campaigning by embracing ICTs. Internet-based communication tools are either used on their own or are embedded in traditional marketing strategies. Virtual campaigning has led to a much more sophisticated political marketing approach. Though there is much research to be done on their impact, efficiency, and drawbacks, virtual campaigns have established their ubiquitous presence. The two-way flow of communication, the control over content production, the low cost, and the extensive exposure are only some of the benefits that the new technologies offer users. The masterful utilization of these new technologies by U.S. politicians could not help but be noticed by political actors around the world.

Canada

Social media have become an increasing presence in the everyday lives of Canadians. Yet, in spite of an online presence consisting of Web sites and blogs, politicians and political parties have generally lagged behind in making use of social media. Overall, they still regard these Web sites as means of disseminating information rather than spaces where they could engage citizens in real discussions. Citizens have also relied on social media to respond to or resist existing political configurations. As several cases of unexpected citizen mobilization through Facebook and Twitter have gained notoriety, social media became increasingly imagined as crucial

to making grassroots politics both visible and effective.

Politicians and Political Parties

In Canada, most politicians and political parties have an established presence on social media, although the type and frequency of use vary greatly. The political parties currently represented in the parliament (Bloc Québécois, the Conservative Party of Canada, the Green Party of Canada, the Liberal Party of Canada, and the New Democratic Party) have traditionally relied on Web sites and blogs to inform their constituencies. Political parties and politicians have gradually added Facebook, Twitter, Flickr, or YouTube accounts in an effort to be present in the new communication spaces inhabited by Canadians. During elections, the use of social media by politicians and political parties rises to prominence. While occasionally a politician's social media activity becomes newsworthy outside of election times, such stories tend to have a controversial component and, overall, receive less academic or journalistic attention.

A relatively recent phenomenon, the electoral use of social networking sites such as Facebook or Twitter in Canada has been, to a great extent, encouraged by the enthusiasm surrounding the media coverage of Barack Obama's 2008 U.S. presidential campaign. Yet, the role of such sites during the Canadian federal elections held the same year remained limited: parties relied on the more established official Web sites and blogs. As parties and specific politicians started to experiment with Facebook or YouTube, the latter were mostly used in a static way, merely to present information on the electoral campaign or to announce specific news. Social networking profiles were rarely used to engage with voters, while politicians' profiles were rarely updated.

On the other hand, political parties relied on the use of online videos for electoral purposes, creating and posting content that occasionally became viral. Further studies on this use are warranted, as anecdotal evidence suggests that negative ads and attack videos were also the most widely seen and shared videos. For instance, the "Pooping Puffin" video circulated by the Conservative Party depicted a bird pooping on the shoulder of the Liberal Party leader; the video backfired, the Conservatives apologized, and subsequently removed

the video. Overall, the use of such videos remains a campaign strategy of praising leaders or attacking opponents, inviting little feedback or engagement from citizens.

For political communication scholar David Taras, social media made a proper debut in the context of Canadian electoral politics with the 2011 federal elections. These elections were marked by an unrestrained enthusiasm for the potential role of Facebook and Twitter (and to a lesser extent, YouTube and Flickr) in bringing politicians and voters closer. However, Taras remains skeptical, arguing that while the effectiveness of social media is difficult to assess, in all probability, electoral uses of social media remain the fiefdom of political junkies.

For example, Twitter can be understood as an online space where journalists, politicians, and interested citizens interact with each other. However, Taras suggests that in the context of the 2011 federal elections, this space was largely dominated by a small number of journalists and leading campaign tweeters, with the rest of the followers merely consuming the discussion. Furthermore, the number of Canadians active on Twitter remains rather low. Last, but not least, the different parties running in these elections have made strategic choices to invest in specific social media (e.g., the New Democrats used Facebook to share photos and promote upcoming events; both the New Democrats and the Green Party created an iPhone application providing updates about the campaign), but there does not seem to be a general consensus over what works or what should be included in the campaign strategy. In general, the use of social media was neither innovative nor sufficient by itself to explain the results of the elections.

Where the political use of social media during federal elections has so far been modeled after the broadcasting model of communication (i.e., one to many), the 2010 municipal elections in Calgary, Alberta, have been touted as the “right” way of using social media in electoral politics. Naheed Nenshi’s reliance on Facebook, Twitter, and YouTube to connect to voters has been seen by journalists and political commentators as an important factor in his unexpected rise from a relatively unknown politician to Calgary’s mayor. An independent candidate, Nenshi’s insistence on

answering the tweets and posts left by citizens on his social networking accounts, as well as his informal and funny YouTube self-presentations, were seen as succeeding in mobilizing previously apathetic constituencies, particularly youth. While these elections were indeed marked by a significantly high voter turnout, the latter cannot be explained simply by reference to social media use.

Nevertheless, the media coverage of these elections brought to light various aspects of social media use for electoral purposes. First, effective use of social media requires that politicians tap into the specific interactional dimension of these sites. Thus, politicians are expected to not simply use social media as a means of self-promotion or dissemination of campaign platforms, but rather as a means of entering into a dialogue with citizens. Second, by becoming part of this dialogue, politicians can no longer control their own representation; tweets will be retweeted, Facebook posts will be shared and, in the process, their message can be altered or reappropriated. However, in the absence of sufficient research on the electoral effectiveness of social media, it is impossible to assess the extent to which social media will indeed transform relations between citizens and politicians. More important, the direction of this transformation cannot be assumed as either empowering for citizens or necessarily leading to a more democratic political setting.

Citizens

To a great extent, Canadians have started using social media to engage with politics long before their politicians, political governments, or governments did. However, not all Canadians have Internet access or use social networking sites, although the adoption of the latter has grown across all age groups. Even when it comes to those Canadians who are online, the extent of use of social media for political purposes remains hard to assess, as seemingly innocuous actions such as liking a politician’s Facebook status can constitute both an act of passive consumption of, or active engagement with, politics.

In the early 2000s, blogs were the most visible form of social media used for political discussions. Partisan blogs were often maintained by politically active citizens. These blogs were clustered into blogrolls (i.e., lists of blogs), based

on political affinities. Although such blogs did engage each other in discussions over platforms and issues, becoming a deliberative space within a democratic setting, this deliberation remained dominated by a few bloggers and segregated along ideological lines. Furthermore, the impact of such blogs on Canadians at large, or on elections, is not clear, as empirical studies are largely missing.

Canadian citizens with Internet access often engage in the creation and maintenance of an active civic culture by relying on social media. The political use of the latter varies greatly, from the creation of online content to disseminating existing political information or mobilizing citizens around particular issues. Many federal and provincial government agencies have now incorporated social media into their daily communication practices; in most cases, these profiles are controlled in a centralized manner by strategists and used to broadcast information. On rare occasions, governments try to consult citizens on local issues (with British Columbia and Alberta often touted as examples of successful government/citizen interaction). Citizens are also contributing to this dissemination-based use of social media: for instance, the popular hashtag #cdnpoli brings together tweets discussing Canadian politics, often recirculating official news. Yet, the extent to which these activities represent a dialogue between citizens, politicians, and governmental institutions, or affect the decision-making process, remains unclear.

Occasionally, citizens also use social media to engage with politics in innovative ways. In the 2011 federal elections, students orchestrated “vote mobs” (public gatherings where participants use makeup, clothes, or dancing to attract attention and encourage voting) and uploaded them on YouTube. During the same elections, a group of artists and citizens from Vancouver created and uploaded several YouTube videos mocking the Canadian prime minister and Conservative candidate, Stephen Harper. The videos, collected under the name “Shit Harper Did,” went viral within hours. Such cases were quickly noticed by traditional media, who further amplified them.

Social media have also been used as both mobilization tools and as repositories of opinion and information challenging traditional media coverage and official governmental communication. Such initiatives can be driven by both individual

The 36th mayor of the city of Calgary, Alberta, Canada, Naheed Nenshi in October 2010, eight days before the election. Nenshi's ability to connect with voters on Facebook, Twitter, and YouTube was seen as an important factor in his rise from an unknown politician to Calgary's mayor.

Canadians and nonprofit organizations, and seek to spur debate, post information, and urge Canadians to act. In 2007, the Facebook group Fair Copyright for Canada drew attention to the proposed copyright reform, successfully delaying the introduction of new legislation as citizens petitioned their representatives and staged protests in public places. In 2010, Canadians Against Proroguing Parliament, another group born on Facebook, successfully mobilized protesters across Canada to oppose the prime minister's decision to temporarily suspend the parliament. More recently, a politically energized coalition of university students used social media to mount their own version of the “Arab Spring” style protest.

Such examples speak not only about the affordances opened up by social media in terms of re-engaging with politics and making it “fun,” but also about the emergence of spaces where

the status quo can be both reproduced and challenged. Most mediatized cases of social media use by citizens and nonprofits for political purposes challenge the status quo. Yet, authorities are also using social media to monitor citizen activities. In the wake of the anti-G20 protests, police scrutinized social media for signs of civil disobedience, while in the aftermath of the 2011 Vancouver riots caused by the defeat of the local hockey team, police relied on social media to identify individuals engaged in the destruction of public and private property. Both examples signal the need for a careful evaluation of the political affordances opened up by social media, as these spaces become monitored by various actors, including the police, employers, and other citizens. Furthermore, it is not clear to what extent social media can also be appropriated by extremist or reactionary politics.

Yet, even with this caveat, the use of social media for political purposes largely speaks to an ongoing interest in and engagement with politics. It is not easy to assess the effectiveness of this engagement, or to assume that social media activities automatically transform into protests, petitions, or voting. However, against a prevailing view of citizen disengagement from politics, the political uses of social media bring to light an active Canadian civic culture. Yet, social media are neither the only spaces nor the only reasons for this culture.

Furthermore, social media open up new spaces where citizens can interact among themselves, or with politicians and official institutions. Such interactions may be issue-driven and short-lived; their effectiveness depends, to a great extent, on being replicated by a sufficient number of people. Yet, this interaction is archived and, to some extent, publicly available. This opens up different possibilities and worries, as both citizens and politicians could be monitored and held accountable on the basis of these archives.

Candidate Image

Candidate image is a term often used in social science literature to describe the cognitive image a voter has of a candidate. This image is based upon a number of characteristics largely categorized as a candidate's position on issues and personal characteristics. Candidate image is an individual construct, in that each person has a different image of a particular candidate. However, these individual constructions can be examined in aggregate to better understand the overall image the voting public has of a particular candidate.

Understanding candidate image is important because research has found that voters make their voting decisions based on overall image of a candidate. In general, voters are more likely to vote for a candidate for whom they hold a positive image than one for whom they have a negative image. Because modern campaigns are candidate-focused, as opposed to party-focused, candidates must appeal directly to voters through many different types of campaign communication, which has traditionally included television advertisements, debates, and campaign Web sites. Social media is an increasingly important form of communication within a campaign and one in which candidates can further define their image with the public. The importance of social media in contributing toward candidate image is a relatively new area of study and one with many questions yet to be answered.

History and Research

Dan Nimmo and Robert Savage's book *Candidates and Their Images* (1976) is generally considered the first major work on candidate image. Nimmo and Savage claimed that voters, through interaction with a candidate's messages, form a cognitive image of a candidate during a campaign. Since that time, the concept of candidate image has been taken up by social scientists with the majority of studies being conducted in the fields of political science and communication. Candidate image is an important concept because it can influence a campaign in many ways. The concept has largely been studied to determine how candidate image emerges, the components of image, and how image affects voting behavior.

Several major conceptual approaches have emerged in the literature. One approach is founded in persuasion literature and sees image as something that is projected by the candidate in an effort to persuade voters. This approach places an emphasis on examining the messages sent to voters to understand what kind of image a candidate wishes to project. While it is true that candidates send messages to voters in a number of ways and that these messages do influence their overall image, voters do not simply accept all messages being sent to them. Therefore, another approach claims that candidate image is determined primarily by the voter and gives the candidate little room to influence the perceptions of the voter.

While both of these approaches help in understanding some of the primary contributing factors toward candidate image—messages from the candidate and the voter—they do not capture the dynamic relationship between candidates and voters. Thus, the most commonly used approach to studying candidate image combines these two factors and examines the interaction of the messages and voter perceptions to examine how the intent of the message is perceived, interpreted, and contributes toward candidate image. Much of the research on candidate image has taken this third, interaction approach. In other words, it is ultimately the composite image a voters holds that determines voting decisions rather than how that image lines up with the image a candidate has attempted to communicate to the voters, but the messages sent by candidates during a campaign

can have a profound influence on overall candidate image.

To explain how candidate image emerges, most studies examine the candidate-voter interactions during a campaign. This approach to image assumes that voters form their own individual images of candidates; however, these images are formed in relation to messages and events in the campaign. A campaign provides voters with a myriad of messages about a candidate. Those messages serve to form a candidate's image—the composite perceptions of a candidate in the mind of a voter. Additionally, candidate images are formed incrementally over the course of a campaign. For these reasons, candidates are constantly sending messages to voters and should constantly monitor their public image and the other messages about themselves being sent to voters.

One type of message that candidates send to voters is their issue positions—the stance of a candidate on any given campaign issue. Studies have shown that voters do not separate candidate issue positions and candidate image. Instead, voters combine issue positions with image perceptions in an effort to create an overall candidate image that is partially based on issue positions. Thus, most candidates are careful and strategic in what information is given to the public on their issue stances. While scholars disagree regarding the importance of issue positions on candidate image, there is clear evidence that issue positions and candidate image are correlated. Those candidates whose issue positions are favorable for a voter are also those candidates with more favorable images for the voter.

Additional research has focused on how much emphasis is placed on issue positions versus image characteristics in overall voting choices, as well as how much an issue position contributes toward overall candidate image. Much of the research in this area was conducted in an age without social media. The emphasis of the research was on how candidates conveyed their messages through traditional media and the relative weight given to those messages by voters. New research has yet to fully take up the question of how social media changes the way candidates present their issue positions to voters and the relative weight given to issue positions compared to image characteristics via social media.

An important component of candidate image is its temporary nature. An examination of the research on candidate image shows there is a loose, common set of “ideal” candidate characteristics that is relatively stable across campaigns. What is not stable is the relative weight given to an individual characteristic in any given campaign. The voting public and the candidates set the agenda as to what issues and image characteristics are more salient for a candidate in a particular campaign. The candidates are then judged based on those salient characteristics.

Candidate image is not a static concept. It is constantly changing based on new information that a voter receives about a candidate. Campaigns can now take many months from start to voting day. During that time, many messages can influence a candidate’s image. Most notably, major campaign events such as candidate debates can have a profound effect on the image a voter holds of a candidate. Several studies have examined the shift in candidate image surrounding events such as campaign debates and have found them to be influential in changing candidate image. Additionally, during the entirety of a campaign, many slow changes in candidate image can occur. The position of a candidate as an incumbent or challenger also has an influence on the candidate’s image.

Components

Although candidate image has been examined by a number of scholars, the exact components of candidate image are still being debated. A number of studies have been conducted in efforts to determine the components of candidate image. Many of the studies have employed scales and asked respondents to rate candidates on a variety of characteristics. The characteristics of candidate image that are studied are many and varied. Some of the most commonly examined characteristics of candidate image are: credibility, trustworthiness, competence, composure, sociability, physical attractiveness, homophily, leadership, strength, honesty, intelligence, activeness, and experience. Early research defined image as focusing purely on a candidate’s personality characteristics, appearance, and behavior. However, an increasing number of studies have found an association between candidate issue positions and candidate image perceptions. Recent research found that voters

supported candidates who were consistent with their own ideologies and preferences in both issue stances and image characteristics. Thus, scholars studying the components of candidate image have also included an examination of how voters perceive a candidate’s issue positions as similar to their own.

As stated previously, research directly attests to the claim that image has an effect on voting decisions. It is this effect on voting that indicates why image is an important part of any campaign. Several studies have examined various types of campaign communication to understand how they influence candidate image. It is important to understand the influence of the various types of campaign communication on candidate image and also examine how social media is changing the influential nature of these traditional types of campaign communication.

Campaign Communication

Political candidates in the past few decades have enjoyed the opportunity to reach the public through mass-mediated forms of campaign communication, such as television advertisements, campaign Web sites, televised debates, and, more recently, social media. Scholars have examined these forms of communication because of the important effects they may have on candidate image in the minds of voters and the general public.

Noted effects on candidate image and voting behavior have supported the importance of the television campaign ad to political candidates and their campaigns. Further, the public perceives television as a very credible source of information, historically indicating they are more likely to get their information about political candidates from television than from other media sources such as newspapers. As a result, television campaign advertisements play an important role in campaigns. The influence of the television advertisement is further seen with the appearance of these ads in the social media. The costly advertisements used to be seen by a limited public on television, but now can be seen at any time through the use of social media, which further extends the influence of this form of campaign communication.

Research on exposure to television ads typically indicates positive effects on assessments of candidate image, although negative effects have

also been noted. In terms of positive effects, campaign ads have been found to increase candidate name recognition as well as improve overall evaluations of candidate image following exposure to the ads. Exposure to political advertising has resulted in higher candidate ratings for characteristics such as intelligence, strength, dependability, honesty, and fairness. In terms of negative effects on candidate assessment or image, findings typically reflect that exposure to negative advertising produces negative image evaluations of an opponent. The positive and negative effects are both important findings because both indicate that viewing advertisements influences perceptions of candidate image and, in turn, candidate image assessments are considered an important predictor of voter decision making.

While research on campaign advertisements has suggested that ads are an institutionalized part of presidential campaigns, campaign debates have also been established as a foundational element of U.S. presidential campaigns. Findings indicate that image evaluations of candidates are strong determinants in candidate selection and that debates provide an opportunity for voters to assess and better understand the candidates' personalities and images. While research is not overwhelming, much of it indicates that voters are more likely to gain insight into candidate image rather than candidate issue positions during debate viewing. These findings indicate just how important debates can be to a presidential candidate's image due to the length of time that viewers are exposed to candidates in this type of campaign communication compared to other types. Increasingly these debates are shown on various social media sources in addition to being televised.

Recent U.S. presidential campaigns have seen voters interacting with candidates and others via social media during debates. The added importance of an additional medium through which a voter can experience a debate brings about new influences on candidate image. The previous model of debate watching on television in the privacy of one's home meant there were few outside influences on a person's perceptions of the debate while debate watching. Now, many voters watch debates via social media and/or while using social media such as Twitter and Facebook. As a result,

multiple opinions on perceptions of a candidate can influence a person while watching a debate. In addition, those who do not watch a debate can still be influenced by the debate through the continual coverage of the event on social media. The information gathered about the debate through social media can contribute to the image a voter has of a candidate even when the voter was not exposed to the actual debate. This secondary exposure is an area that requires further study to determine the relative weight of the influence compared to that of primary exposure.

Since the 1996 U.S. presidential campaign—the first in which both candidates maintained campaign Web sites—the prevalence of Web sites as campaign tools has dramatically increased at all levels of politics. By 2000, candidates running for all levels of office in the United States had a campaign Web site. The initial value of a Web site is that it allows a candidate a forum in which to present an image and message that has not been reinterpreted by any other source. The Internet has become a widely used vehicle for candidate-controlled information that is available to voters at all times. Voters are increasingly turning to the Internet as a source of information about political contests and candidates. According to research conducted by the Pew Internet and American Life Project, in 2004, over 37 percent of the U.S. adult population used the Internet to get political information. That number dramatically increased in 2008 with 55 percent of the U.S. adult population going online to get involved or get information about the election. Even in the 2010 U.S. mid-term election, 54 percent of adults went online to get information about the election. There is a clear upward trend in the use of the Internet to get political information.

Researchers have found it difficult to examine the effects of exposure to Web sites on voter evaluations of candidates' images due to the ever-changing nature of Web sites and the plethora of information available on one site. The same is true for social media sites where users are often saturated with an incredible amount of news, stories, opinions, photographs, and more during a short period of time. Regardless of this difficulty in measurement, it is clear that social media have become a primary means for candidates and their campaigns to communicate with voters.

When candidates first started using online platforms in their campaigns, they were typically used as conduits for sending messages and image concepts to voters. Today's online platforms provide for much more interactivity, thus increasing the potential for their influence on a candidate's image as the voter interacts with the content. Because social media allow for participation, information creation and sharing, and interaction with a community, the potential messages that compose a candidate's image are multiplied.

Barack Obama's 2008 presidential campaign was the first major U.S. campaign to make significant use of social media platforms. The campaign used Facebook, Myspace, Twitter, and YouTube, among others, to communicate with voters and create and mobilize communities of like-minded voters. As a result, almost all U.S. political candidates now have a presence on social media. Research has shown that voters are now just as likely to get their campaign news and information from online sources as they are from traditional campaign information sources, such as televised advertising and debates. Social media platforms are increasingly a significant part of the overall campaign strategy for candidates at all levels of office. The 24/7 availability of information and the sense of connectivity between candidate and voter via social media will continue to increase the importance of social media in the overall formation of candidate image.

Candidates, Political Branding of

In the past several decades, political candidates and politicians in the United States and in other countries have come to rely on insights and techniques from the discipline of brand management to improve their presentation and appeal to their constituencies. While television has been the dominant medium associated with political branding, in recent years the Internet and social media platforms have become increasingly important for the branding of political actors, and have brought new opportunities and new challenges to political branding practices.

As researcher Manuel Adolphsen notes, following the coverage of presidential races in the United States or of electoral races worldwide, one might get the impression that it is less a political contest and more a marketing competition, not unlike those between Nike and Adidas, Coca-Cola and Pepsi, or the various airlines. Many political experts and campaign teams advise political figures to employ strategies from brand management to create their particular and recognizable set of messages and emotions, their own brand, and to align their communication activities through various types of media outlets with the brand. Additionally, many journalists and bloggers describe the endeavors of political figures, especially during electoral seasons, by means of terms and concepts from management and marketing, particularly those related to branding. Today, branding is being used not only in the mediatization and sale of commercial products but also in the mediatization and sale of political beliefs. Branding is being used for launching and maintaining the images of presidential candidates and other political candidates, and for gaining and sustaining support for political actions and even wars.

A brand has been described by business scholars as the symbolic value of a given product or the perceived benefits gained by a consumer when purchasing the product. Such scholars discuss the brand differentiators that are aimed at making a specific product stand out among other similar merchandise and specify that such differentiators are not directly related to economic and functional value, but rather that they are social (pertaining to socialization or standing in society) and cultural (tapping into groups' and communities' customs and traditions). The brand is marked by the systematic association of products with lifestyles desired by consumers or the careful orchestration of sensorial and sensual aspects of the consumption context and situation. The brand, therefore, is related to how the product is showcased, frequently through a comprehensive media or multimedia effort, and what consumers perceive it to be after such an effort. Branding, as such, is viewed in business literature as any organizational activities focused on the creation and fostering of a distinct brand image in the consumers' minds and the public sphere. Branding includes the production and dissemination of

value-laden narratives with emotional appeals and trust-building messages with do-good claims.

In the political arena, the brand is a political actor's public perception, and branding refers to the building and mediation of a coherent conceptual structure which links all aspects of a politician's presence and discourse, including physical appearance, psychological profile (including affective and intellectual, irrational and rational facets), and content and style of communication. Branding of political candidates during election campaigns and of politicians in office after the elections has been accomplished through value-based words, images, and gestures to connect with the public as well as through promises of action, change, or uprising to gain needed support. Such political branding practices have become powerful tools that enable aspiring politicians and elected officials to configure their identities to appeal to their target publics and the general public, and as such to encourage identification of citizens with their personas. Additionally, such practices have enabled political figures to counteract the images of other politicians and as such to hurt their political opponents.

Because of its strong impact on political life, branding has raised many evaluative questions. Some commentators have argued that political branding has positive consequences because traditional political communication leaves many people indifferent, whereas political candidates' and politicians' adherence to the rules of commercial branding helps facilitate a brand connection and thus empower the electorate and various constituencies. Other observers have contended that political branding has negative consequences either because branding might drive substance out of politics and replace it with glitz or because the over-reliance on branded communication in politics can easily shift toward manipulation of the public and thus cause injuries to democracy. However, claims have also been made that branding is neither inherently good nor inherently bad, but rather its worth depends on how political actors make use of it.

1980s and 1990s

In the 1980s and 1990s, coordinated political branding campaigns became a political reality first in the United States and, following U.S. examples, in other parts of the world. Such branding campaigns, at the time made up mostly of television

commercials, televised campaign speeches, and televised interviews, were aimed at showing what was unique about a candidate, what would make the respective candidate different from others, and what would make the specific candidate distinguishable for the public. In the 1980 presidential campaign, Ronald Reagan ran on a platform that both encouraged consumerism and employed consumerist appeals. The Reagan brand was built on the emotional narrative, which seemed consistent with the American dream, of the politician's rise from a humble background to fame, and was also built on promises of progress, prosperity, fiscal responsibility, and global democracy made to the American public and especially to the Baby Boomer generation.

In the 1992 presidential campaign, commercial branding experts helped position Bill Clinton as a candidate and then a president with a message that was direct, simple, moving, and reassuring. The Clinton brand also integrated an emotional narrative alluding to the American dream, but it linked to it promises of government support to those in need and of social justice.

Particularly noteworthy internationally was the rebranding in the mid-1990s, with inspiration from Clinton's branding campaign and with assistance from commercial branding experts, of Tony Blair and the British Labour Party. A television campaign set up by a consulting company specializing in branding helped transform Tony Blair's image from one of a youthful optimist with exceedingly idealist views to that of a mature politician capable of combining optimism with pragmatism. The campaign also helped reposition the Labour Party from a political force with a focus on the lower societal class to a "New Labour" with potential interest for the working and professional categories. The Labour Party's huge success in the 1997 elections and Blair's subsequent tenure as prime minister led to the widespread involvement of branding experts in politics not only in Great Britain but also in Germany, France, and other European countries. Tony Blair himself used branding again to reconnect with the British electorate in the subsequent electoral cycle.

2000s

Now established as useful in campaigns, political branding has slowly but steadily been adjusted

into the first and the second decades of the third millennium to include not only televised but also new media activity of political figures. In 2000, the attempts of the Al Gore campaign to pursue Internet branding to mobilize the younger electorate remained ultimately unsuccessful. However, it is unclear whether this was due primarily to the novelty of the new media as a means for political communication or mostly to the greater branding capability of the George W. Bush campaign.

The Bush team had already used branding extensively in the 2000 Republican Party primaries to position the candidate as a folksy character, a compassionate conservative, and a believer in freedom, and to cast doubt on opponent John McCain's integrity, views, and plans. Bush went on to be dubbed "the ultimate brand" in the media for the simplicity and discipline of his campaigns and the skillful integration of values and emotions into his discourses, which worked to solidify the support of his base and to diminish public support for his challengers both in the presidential defense of the need for the Iraq War and when the incumbent president was facing Democratic Party presidential nominee John Kerry.

In 2004, the efforts of the Howard Dean campaign to add to the list of political branding tactics blogging, particularly blogging with reader response capacity, created many waves in the American political arena, yet the triumph of the Dean brand was short-lived, for various reasons that might range from the newness of blogging as a political practice to the differences in public perception of the candidate in new media environments as compared to traditional media environments to the lack of message discipline of the candidate.

After the innovative uses of blogging by the Howard Dean campaign team in 2004, and as social media continued to diversify and grow in popularity, political candidates for various offices at national and local levels in the United States started social media operations for political branding purposes. Meanwhile, political candidates, public officials, political parties, and activist groups in various other countries in the Americas and on other continents have found branding opportunities through social media.

In the 2008 Democratic Party primaries and presidential elections in the United States, political

communication experts noticed the seamlessness of Barack Obama's corporate identity and the promotion of his image in the same way as a consumer brand. With lessons learned from the Dean campaign, the Barack Obama campaign built in 2008 an unprecedented political branding operation that integrated traditional media and social media, and replicated in 2012 the operation, although many doubted the repeat was possible.

The Obama image relied on previously utilized brand differentiators such as the narrative of the unlikely candidate, as well as on original ones such as the narrative of his community organizing experiences. It relied on simple key concepts like hope and solidarity, which some argued to be groundbreaking and others found to be inspired by social activists in the United States and internationally. It also relied on a now well-known refusal to use emotional appeals and to appear as a populist, instead enhancing likeability through coolness and candor. But what made the Obama brand truly unique in the 2008 and 2012 elections was the ability of the campaign not only to use social media platforms for mobilizing potential voters and interacting with them, for gaining political capital and doing fund-raising, but also to allow no discrepancy between approaches to the traditional media and to the social media, bridging the two in a coherent manner.

Additionally, scholars have found that the viability of the Obama campaign was enhanced by several unmatched social media practices in the political arena so far, including tapping into existing networks (of grassroots activists, of students) to amplify support, offering the right incentives (donation matching, dinner with Barack Obama) to increase engagement, and always striving to personalize the social media experience. It is therefore no surprise that Obama-style cross-media and social-media branding is being emulated worldwide.

CAN-SPAM Act (2003)

The Controlling the Assault of Non-Solicited Pornography and Marketing (CAN-SPAM) Act of 2003, Public Law 108-198, was a U.S. law passed by the 108th Congress and signed by President George W. Bush on December 16, 2003. The law regulates unsolicited commercial e-mail and placed several limitations and penalties on such

messages. *Spam* is a broad term that refers to any unsolicited commercial e-mail message that is a nuisance to computer users. Spam e-mail frequently contains fraudulent or deceptive marketing content or unwanted sexual subject matter that offends recipients. The high volume of spam often requires Internet service and e-mail providers to upgrade systems to handle the high level of e-mail traffic. At the time of the act's passing, spam was viewed as a major problem and a threat to the viability of e-mail. Issues related to the CAN-SPAM Act are of interest to social media political strategists because advocates of unsolicited commercial e-mail argue that spam is a legitimate solicitation technique that is protected by the First Amendment.

The CAN-SPAM Act states that unsolicited commercial e-mail may be sent to recipients as long as the messages conform to several regulations. For instance, header information, such as originating domain name and originating e-mail address, may not be false or misleading. The subject heading of the e-mail must not be deceptive. A working return e-mail address or functioning opt-out mechanism must be included in the message to allow recipients to indicate that they do not wish to receive future commercial e-mails from the sender. Unsolicited messages may not be sent to a recipient who has opted out unless the recipient opts back in to receiving e-mail from the sender. The e-mail must be clearly and conspicuously identified as an advertisement or solicitation, and businesses may not knowingly promote themselves with false or misleading e-mails. Commercial e-mail containing sexually oriented material must include a warning label in the subject line.

Under the act, the Federal Trade Commission (FTC), state attorneys general, and Internet service providers, but not individuals, may sue violators of these provisions. Violators are subject to statutory damages of up to \$250 per e-mail, up to a maximum of \$2 million, which may be tripled by the court to \$6 million for serious, aggravated violations. Violators may be sentenced to up to three or five years in prison for knowingly committing fraud through e-mail, such as falsifying header information in multiple commercial e-mails or accessing a protected computer without authorization and using that computer to send commercial messages.

Many requirements of the act do not apply to commercial messages when the business and recipient have a pre-existing relationship, such as information regarding a subscription membership, or account, warranty, or product recall information; notifications of account balance; and e-mails about product updates or upgrades. The CAN-SPAM Act preempts state laws specifically related to spam e-mails.

When the CAN-SPAM Act was being considered, many antispam groups advocated that the legislation should go further. Some argued that commercial e-mail should be prohibited unless a recipient has opted in or given prior affirmative consent to receive the message, similar to an opt-in requirement adopted by the European Union. Others argued that a centralized list similar to the National Do Not Call registry should be created wherein consumers could place their names to opt out of all commercial e-mail. A do not e-mail list was not included in the CAN-SPAM Act, but the act did require the FTC to study the feasibility of such a registry. In its report, the FTC concluded that such a registry would not decrease spam without an effective authentication system and that an e-mail registry would raise serious security and privacy threats.

Many lawsuits and legal actions have been brought against spammers based on the CAN-SPAM Act. In 2004, the FTC filed a civil lawsuit against Phoenix Avatar, a Detroit-based spam operation, and charged the company with making deceptive claims about a diet patch sold via spam e-mails and not including a valid opt-out opportunity. Phoenix Avatar later settled with the FTC. In March 2006, the FTC obtained a \$900,000 consent decree against Jumpstart Technologies, LLC for numerous alleged CAN-SPAM Act violations, including disguising its commercial e-mails as personal messages and misleading consumers as to the terms and conditions of its promotions.

The CAN-SPAM Act was intended to address unwanted commercial e-mail messages and does not apply to text or multimedia messages between cell phones (also called short message service, or SMS). Text messages sent between two cell phones or from one phone to many phones does not fall under the definition of spam in the CAN-SPAM Act; however, when messages are sent to e-mail addresses associated with a mobile device

or from an e-mail account, it does fall under the act. Mobile spam remains a concern, and several bills have been introduced that would change the statute to cover mobile spam.

Cantor, Eric

Eric Cantor is Virginia’s 7th Congressional District representative and has served in the House of Representatives since 2001. He is a member of the Republican Party and is, in many opinions, one of the most influential members of Congress. On January 3, 2011, Cantor was elected House majority leader, the second-most powerful position in the House of Representatives. Many analysts believe that he will one day be elected speaker of the House if the Republicans maintain their control over the chamber. During his tenure in Congress, Cantor has also become known as an innovator in his use of social media to make Congress more accessible to the public and to advance his partisan objectives. Cantor’s partnership with his communications director, Matt Lira, has produced a number of social media initiatives that have the potential to change how Congress operates and how citizens interact with their government.

Cantor was born in Richmond, Virginia, the son of a schoolteacher and real estate agent. Cantor’s father was involved in national politics and

served as state treasurer for Ronald Reagan’s 1980 presidential campaign. While attending George Washington University, Cantor interned for House Republican Tom Bliley of Virginia, where Cantor began his interest in politics. After earning a law degree from William & Mary Law School and a master’s degree from Columbia University, Cantor’s sights turned toward a seat in the Virginia House of Delegates.

Cantor was elected to the Virginia House of Delegates in 1992 and served for nearly a decade. During that time, Cantor served on a number of important committees, including the committees on Corporation Insurance and Banking, General Laws, Courts of Justice, and Claims. He also served on the committee on Science and Technology, where he began to take an interest in emerging trends such as the Internet.

On March 14, 2000, Cantor announced that he would seek a seat in the House of Representatives being vacated by Congressman Tom Bliley. Cantor had previously worked on Bliley’s reelection campaigns, and Bliley quickly endorsed Cantor for the seat. With the assistance of Bliley’s political organization and endorsement, Cantor was able to win the seat.

Cantor has served on a number of influential committees, including Financial Services, International Relations, and Ways and Means. Where Cantor has stood out the most, however, has been his rapid rise through the ranks of leadership. In just his second term of office, Cantor was appointed chief deputy Republican whip, the highest nonelected position in the Republican caucus. During his six years in the position, Cantor proved to be an effective leader and effective in organizing votes and helping control the Republican message. He has proved to be a tireless fundraiser, helping raise more than \$30 million for the National Republican Campaign Committee. His hard work was rewarded in 2008, when he was unanimously elected Republican whip for the 111th Congress. This promotion was followed a year later with his election as House majority leader, placing him second in power to Speaker of the House John Boehner.

Cantor has been a leading conservative voice in the House of Representatives and has crossed swords with Democrats and Republicans alike. On the Republican side, Cantor became

disillusioned with a number of Republicans following the sweeping Republican victories in 1994. He believed that some Republican members had become too comfortable in Washington and had lost their reformist impulse. Others, he felt, had fallen too easily into the trap of pork spending to guarantee re-election. In some instances, Cantor has even supported challengers to these Republicans. On the Democratic side, Cantor has been a leading voice opposing President Barack Obama and congressional Democrats. He supports fiscal responsibility, reducing the size and spending of government, promoting growth, especially through small business, in the economy, and he has continued his war against pork-laden spending bills.

In promoting his principles and leading the Republican Party in the House, Cantor has reached out to social media as a vehicle for leadership and communication. Cantor was one of the first Republican House members to establish a heavy presence on Facebook, which he sees as being one of the key ways that constituents will interact with members of Congress in the future. Cantor was also quick to take advantage of other emerging platforms like Twitter, YouTube, LinkedIn, Quora, and Digg. Cantor, in fact, has been so successful promoting social media applications to his party that the Republicans now lead the Democrats in social media use. Along with Lira, Cantor sees social media as a critical ingredient in the future success of conservatism and the party. Both men agree that the day is rapidly approaching that social media will be the dominant factor in electoral success.

Canter and Lira, however, have not been content to simply make use of existing social media but have attempted to innovate within the field as well. One project, called Citizen CoSponsor, is built on Facebook's Open Graph protocol. The application allows users to pick pieces of legislation that they are interested in, and the application will allow them to track the bill's progress. Users receive updates on the bill as it moves through the legislative process. The application also allows users access to the full text of the legislation. If a person supports the bill, there is also an option to click a button indicating support for the legislation, thus making the citizen a "cosponsor" of the bill.

Republican Majority Leader Eric Cantor speaking at the Values Voter Summit in Washington, D.C., on October 7, 2011. Many consider Cantor one of the most influential Congress members.

So far, Democratic reaction to the Citizen CoSponsor application has been mixed. The idea of allowing citizens greater ways of being informed about the legislative process is very appealing, and the potential exists for greater citizen engagement. At the same time, however, of the initial six bills available for tracking through the application, five were sponsored by Republicans, leading to Democratic complaints that the CoSponsor initiative is highly partisan rather than broadly inclusive. Cantor, in turn, has responded that the application is still in its early stages and that, as it expands, more Democratic legislation can certainly be included.

YouCut

Another innovative project initiated by Cantor was YouCut, which was created to support pledges made by Republicans to voters in 2010 to cut government spending. Each week the House is in session, voters can go to Cantor's Web site and select one of three government programs to cut. The proposal that garners the greatest number of

online votes is then introduced as a bill, and the public is able to track its progress on the Web site. Citizens are also given the option of proposing their own spending cuts to government programs, and thus far, the Web site has generated tens of thousands of suggestions. While not all the proposals are reasonable, some have drawn attention to clearly wasteful spending. One user, for example, discovered \$800,000 that was being spent on a fantasy basketball league.

Democrats have largely dismissed YouCut as a partisan gimmick and have been reluctant to embrace its underlying principle of cutting government spending. Moreover, given that the Republicans do not control the Senate or the White House, there is little chance that any of the spending-cut bills will pass. Cantor, however, remains undaunted. While achieving significant government spending cuts is a long-term goal, the immediate objective of YouCut is to show citizens that legislators care about wasteful government spending at a time when the economy is putting such strain on taxpayers. Moreover, despite Democratic attacks that YouCut is partisan in nature, Cantor disagrees. Social media applications like YouCut, for Cantor, are nonpartisan because they are not fundamentally about promoting a partisan agenda. They are, he maintains, about making government more accountable and allowing it to work better.

Other Projects

Cantor also supports using technology to increase government transparency and allowing greater public participation in the legislative process. First, Cantor has pushed for changes in the way that the congressional record is made available to the public, in particular by allowing it to be read on portable electronic devices. Second, Cantor joined other Republicans in adopting the Standards for the Electronic Posting of House and Committee Documents and Data. Beginning on January 1, 2012, the clerk of the House will now be required to maintain a single Web site where the public can access House bills, amendments, and resolutions. All documents will be posted in XML or PDF formats. Video hearing and mark-ups will also be formatted to be machine readable, allowing for easier transcription and publication. The goal of these changes is to allow

greater citizen involvement and awareness of the legislative process and to facilitate citizens' participation in Congress.

Finally, Cantor and Lira have spearheaded a number of social media summits designed to make Congress more aware of the potential of social media to improve American politics. One of these events was a Hackathon held in December 2011. The Hackathon invited software developers, Capitol staffers, interest groups, and members of Congress to discuss how to use technology to increase government openness and transparency. Among the initiatives discussed at the Hackathon was how to improve grassroots information efforts through social media. Press releases, for example, tend to be one-way communications that do not allow citizens to respond to what they are being told. Social media as a vehicle for information communication allows a number of ways for citizens to not just receive information but also to offer feedback and suggestions for alternatives.

Other topics discussed included how to create more socially connected legislation using social media technologies like YouCut and Citizen CoSponsor. The goal is to create social media hubs where citizens can provide input about what the government is doing and what changes they would like to see. The Hackathon also focused on the need for Congress to become more literate in social media because of the opportunities that the technology offers representatives. Too often, members of Congress delegate social media interaction to staffers because they are uncomfortable or unfamiliar with its application. According to Cantor and others, this unwillingness to engage social media is a big mistake and represents a lost opportunity to engage with constituents in truly meaningful ways. Social media represents a meaningful way for citizens to become involved in government, and direct interaction with representatives is a critical way of making that interaction significant.

In short, Eric Cantor is probably one of the most forward-looking members of Congress in terms of understanding the role and impact of social media in American democracy. His tireless efforts to push his party and Congress to understand the benefits of social media are an important contribution to bringing government into the 21st century. While some critics may dismiss some of his efforts as

being motivated more by partisanship than principle, there is no question Cantor's leadership will continue to push the boundaries of what social media can bring to American government.

Carnivore

Carnivore was a program created under the Bill Clinton administration to surreptitiously alert law enforcement of terrorist activity. Following the terrorist attack on the Twin Towers in New York on September 11, 2001, and subsequent passage of the Uniting and Strengthening America by Providing Appropriate Tools Required to Intercept and Obstruct Terrorism (USA PATRIOT) Act of 2001 ("Patriot Act"), the U.S. government gained new powers to attempt to prevent terrorism.

The Patriot Act allowed pen registers (a device used to record all numbers dialed from one phone line) to collect information transmitted over the Internet and between computer networks, extended the jurisdiction of all pen registers across the United States, required enforcement officials to file a court order to obtain the pen register, and finally, required the hosting Internet service

provider (ISP) to provide the court the following information: the name of the officer who installed the surveillance program, the date the program was installed, and the configuration that the pen register was programmed to search. Project Carnivore had been moribund but was quickly activated after the 9/11 terrorist attacks. This program was an Internet surveillance program overseen by the Federal Bureau of Investigations (FBI); it was designed to carry out surveillance of electronic communications, especially e-mail. The Carnivore program essentially "sniffs out" e-mails that are deemed suspicious by the FBI to look for possible cybercrimes, ones that have been committed or plans to commit cybercrimes.

In 1998, the FBI began to create a program known as Carnivore. The program was originally designed to sift through the contents of a suspect's e-mail, and when it was deemed necessary, to record that person's e-mail for future reference. Some Americans felt that this program was an invasion of their privacy. The FBI contends that Carnivore is a "sniffing" program; Carnivore sniffed through e-mails via the ISP, filtered the data, and searched for the information the Carnivore was programmed to seek. They say it was a confined search, that Carnivore processed the relevant data, and created an event file to show it complied with the court order that was required for the FBI to use Carnivore. By doing this, the FBI claims that the searches are not in violation of the Fourth Amendment. The FBI says that Carnivore did not violate the Fourth Amendment because it only searches for what the court order authorizes, thus not overstepping its boundaries. The FBI justifies its position by pointing to the rise in cybercrime and how the government has had to adapt to the times with advances in technology. The purpose of Carnivore was to ensure the safety and security of the American people. Some of the crimes that the FBI was targeting with the program were terrorism, information warfare, child pornography, and securities fraud.

Legal History

One of the first Supreme Court cases to deal with the issue of electronic monitoring was *Olmstead v. United States* (1928). In this case, the FBI placed a wiretap on the phone of Roy Olmstead, a suspected bootlegger, without judicial approval. The

Supreme Court held that telephone conversations did not receive protection under Fourth Amendment rights. Under the Supreme Court's approach to this case, the FBI did not need to obtain a warrant to seize evidence unless it physically trespassed to obtain the evidence. Even though the court ruled so, Justice Louis Brandeis dissented, saying that wiretapping was an invasion of privacy, thus violating the Fourth Amendment. Wiretapping, he claimed, allowed the FBI to listen in on conversations that might contain confidential information. He concluded that the government violated the Fourth Amendment when it used wiretaps without obtaining a warrant to do so.

Thirty-nine years later, the Supreme Court changed its original opinion in a different case that was brought before the court. In *Katz v. United States* (1967), the court overruled the *Olmstead* decision and changed its opinion to agree with Justice Brandeis's dissenting view. In *Katz*, the court held that the FBI was violating the Fourth Amendment rights of citizens in wiretapping without a warrant. The court ruled that recording oral conversations is protected under the Fourth Amendment. Essentially, evidence does not need to be physically seized for the Fourth Amendment to protect it, and a warrant is needed for law enforcement to use a wiretap on suspected criminals.

The following year, Congress passed the Omnibus Crime Control and Safe Streets Act of 1968. The particular point of interest in this bill is Title III. The statute issued guidelines that the FBI must follow in order to obtain electronic information. It required a written application showing probable cause to be filed with a judge in the local jurisdiction. The judge must decide if the standard for probable cause has been met before he or she authorizes the wiretap or pen register. In 1986, under the Electronic Communications Privacy Act, Congress slightly amended Title III. This act still confirmed that a pen register receives less protection than a wiretap, but it established procedures by which law agencies could obtain pen registers.

The next major advance in government surveillance came in 1994 when Congress passed the Communications Assistance for Law Enforcement Act (CALEA). CALEA enacted the following procedures: when law enforcement asks, a

provider of electronic service must help install wiretaps and pen registers; ISPs must make sure to allow only the government to use the device, which they are authorized by a court to do; and all networks must have the ability to accommodate electronic surveillance by 1998. All in all, there has been great progress in the government's ability to obtain and use wiretaps and pen registers. Government abuse of electronic surveillance is still possible, but many procedures have been enacted to ensure that it does not occur.

There have been several attempts to seize articles from third-party news organizations in the past. *Warden v. Hayden* (1967) held that search warrants could be issued to law enforcement to seize evidence in connection with crimes. Similarly, *Zurcher v. Stanford Daily* (1978) held that prosecutors could seize evidence from news organizations. In response to the *Zurcher* decision, the U.S. Congress passed the Privacy Protection Act (1980). The Privacy Protection Act's purpose is to protect the work of journalists from being seized unless they are suspected of a crime. This act protects the author's work as long as it is original and the author has the intention to publish it. The statute also protects such things as newspapers, books, and broadcasts. The information that the journalists are presenting is protected as long as they are not involved in a crime or cause a physical injury, or the person holding the materials committed a crime. As long as journalists are not involved in a crime, their information cannot be seized through the Carnivore program. However, if the FBI has suspicion that journalists are involved in a crime and their work needs to be seized, the FBI can obtain a search warrant from a magistrate and seize the evidence.

Concerns

Carnivore, as envisioned, raised the possibility that constitutional protections were in jeopardy. The Fourth Amendment of the U.S. Constitution protects U.S. citizens from searches and seizures without due process. Many citizens and social groups feared that Carnivore, as it stood, breached the Fourth Amendment rights of the people of the United States. Before the Internet was first created, there was debate about whether the government could monitor the phone calls of suspected criminals.

The concern brought forth is that Carnivore breaches the Fourth Amendment; however, the FBI reiterates that it does not invade privacy because the Department of Justice cannot search and seize anything without a court order to do so, thus claiming that the due process test is met. When an e-mail is flagged and the conditions of the warrant are met, the date, time, origin, and destination of the e-mail are sent to the FBI. The FBI has called Carnivore a diagnostic tool that works through an Internet service provider; it separates only those e-mails under investigation and it does nothing with the rest.

When Carnivore was first implemented, multiple groups questioned its effectiveness and feared the intrusive agenda of government. Several of the parties who were not in favor of the program were privacy groups, Internet service providers, and House Majority Leader Richard Armey. They wondered how the Carnivore program met the requirements of a legal wiretap. Two major issues were brought up at the hearings held to discuss the program. The first issue was that many felt Carnivore should require a full Title III court order instead of just a pen register. The second issue in the hearings was whether the FBI had overstepped its boundaries in creating the Carnivore system. A U.S. appeals court decided that Carnivore was to be treated like any other wiretapping program and that it needed a court order before the program was used. Before the program ended however, it still only used a pen register instead of the full Title III court order.

The FBI officially ended the Carnivore program in 2005. Instead of continuing Carnivore, the FBI decided to use commercial software and asked ISPs to wiretap, and compensated them afterward. The FBI did not use the Carnivore program at all between 2002 and 2003. The reason given for why it abandoned Carnivore was that the software was too expensive to use. At the time, many experts believed that Carnivore was a far superior product than the commercial products. However, many advances were made with the commercial software, which is why the FBI decided to discontinue the program.

Catholic Church and Social Media

Although involved in communication to and interaction with the general public for centuries, the Catholic Church was not quick to embrace the use of social media. As an important tool that permits organizations to reach millions of followers quickly and inexpensively, however, church leaders are exploring social media as a means of communication, outreach, and interaction with the public. In utilizing social media, the Catholic Church has made use of both existing social media, such as Facebook, Twitter, and YouTube, and Web sites and other applications specifically developed to interact with the broader general public as well as the Catholic faithful. More attention is gradually being given to the effectiveness of various social media platforms as pressures to communicate with as many as possible is balanced with the results of those communications.

The Roman Catholic Church, with over 1.2 billion members, is the largest Christian

denomination globally. Among the oldest institutions in the world, religious or secular, the church is headquartered in Vatican City and uses a hierarchical model of governance led by a pope as well as various cardinals, archbishops, bishops, and other leaders who, per church teaching, are the apostolic successors to Christ. The Holy See represents the ecclesiastical and canonical authority of the church and refers to both its central administration and authority. Individual nations are divided into dioceses, which in turn are divided into parishes.

Each diocese is led by a bishop or archbishop, and there are nearly 2,800 dioceses globally. Nearly 1 million individuals belong to religious orders, serving as nuns, brothers, or priests. Some of those ordained report directly to bishops or other diocesan authorities, while others are members of separate religious orders, such as the Society of Jesus (the Jesuits), Carmelites, Dominicans, or Franciscans. These religious orders have their own governance structures, although ultimate authority over ordained members rests with the Holy See and the Roman Curia.

From its base of operations in Vatican City, the Holy See has long sponsored and operated a variety of media that are used to communicate with both the Catholic faithful and the outside world. Since 1861 the Holy See has published the daily newspaper *L'Osservatore Romano* (The Roman Observer). *L'Osservatore Romano* is published daily in Italian, with weekly editions also appearing in English, French, German, Malayalam, Polish, Portuguese, and Spanish.

The newspaper presents coverage of the pope's activities, official documents of importance, and editorials by members of the Curia. Although considered the official newspaper of the church, *L'Osservatore Romano* does not possess the *Magisterium*, or teaching authority, of the Holy See unless an article or editorial is penned by a member of the Curia. Official documents are published monthly in *Acta Apostolicae Sedis* (Acts of the Apostolic See), a gazette devoted to encyclical letters, official decrees, and ecclesiastical appointments. The Holy See also operates Radio Vaticana (Radio Vatican), which broadcasts programming around the globe in 47 languages and which has operated since 1931. In 1983 Centro Televisivo Vaticano (Vatican Television Center) debuted, and

it provides programming chiefly related to the pope and his activities and travels.

Social Media and the Holy See

In 1995, the Holy See launched the Vatican's Web site, which can be found at www.vatican.va and which provides information in eight languages, including Chinese, English, French, German, Italian, Latin, Portuguese, and Spanish. This Web site contains a variety of information about the pope, the Holy See, and the Vatican. Biographical information is included about the pope, as well as a calendar of his activities; a collection of encyclicals, letters, messages, and other messages and speeches; prayers; and apostolic exhortations and constitutions. Also included are photographs of the Vatican, various popes, and visitors to the Holy See. The Web site also provides links to information regarding this history of the Holy See, liturgical celebrations, various offices of the Roman Curia, and other miscellaneous information. As one might expect from a religious organization, the Holy See Web site also includes a variety of online reference materials, including the Catholic Church catechism, the Bible, the Code of Canon Law, books, and documents related to the Second Vatican Council. Links to Roman basilicas and papal chapels are provided, as is a concordance to the liturgical year.

In December 2012 Pope Benedict XVI launched a Twitter account, using the account name Pontifex. Twitter is a social networking service that permits users to microblog by sending followers text-based messages of up to 140 characters in length. These messages, known as tweets, can be accessed through either the Internet or a variety of mobile devices.

In the three remaining months of his reign, Pope Benedict drew 3 million followers, and his successor, Pope Francis I, found his following had swelled to over 6 million when he took over the account. This compares with the 30 million followers of U.S. President Barack Obama or the 38 million of popular singer Justin Bieber. Although he was 85 years old when he first tweeted, Benedict was a strong proponent of using social media as a means of communicating with the Catholic faithful and others. During his reign, he became the first pope to maintain a Facebook page and a YouTube channel.

The Vatican desires to use social media to communicate the Catholic Church's message to a younger audience that is increasingly adept at using technology as a means to communicate. Certainly the social media accounts have permitted priests and others to employ a variety of audiovisual resources, including animated features, blogs, images, videos, and Web sites, in conjunction with traditional means to engage in dialogue, evangelize, and teach. Some have suggested, however, that the church's use of these applications has proven more successful in communicating with those who are already participants than with nonbelievers.

Opus Dei

The Prelature of the Holy Cross and Opus Dei (Opus Dei) is a conservative Catholic organization founded in 1928 that encourages its members to apply spirituality to their daily lives and to adhere to a strict regimen of prayer and ritual. Controversial, Opus Dei is embraced by those Catholics who desire a more traditional approach, including a "call to holiness," while the group is reviled by those who believe it to be misogynistic, secretive, and elitist. Opus Dei has made great use of social media, the Internet, YouTube, and other electronic means of communication in order to reach its members, advocate for certain issues, and provide information to the general public. Opus Dei's Web site, for example, contains a variety of articles, videos, podcasts, and other information organized around a variety of themes. These themes include information about Opus Dei, personal testimonies of members, social initiatives, multimedia presentations, links to other sites, and the like. In an effort to reach as many individuals as possible, the Opus Dei Web site can be accessed in 30 different languages. Opus Dei has also posted videos on YouTube, used Twitter, and established a distinct and commanding presence using social media.

Opus Dei's success with social media has not gone unnoticed. In 2012 the Vatican, reeling from a variety of communications missteps, hired Greg Burke to formulate its media strategy and to coordinate the Holy See's social media endeavors. Burke, a member of Opus Dei who holds a master's degree from the Columbia University School of Journalism, previously served

as a journalist with *Time* magazine and as a correspondent with Fox News. The scope of Opus Dei's social media presence has been universal, with chapters in 66 nations around the globe, many of which have their own Web sites and social media accounts. Individuals and organizations that oppose the work and policies of Opus Dei have also used social media and the Internet to criticize the prelature, with a variety of sources of information critical of the group. Because Opus Dei embraced social media relatively early, however, it has been able to respond to these criticisms quickly and effectively.

Order-, Diocesan-, or Parish-Based Social Media

In addition to those social media sites and applications controlled by the Holy See and Opus Dei, a variety of Catholic religious orders, dioceses, and parishes use social media to communicate with their congregants and the general public. When initial attempts to give the church an electronic presence took place as early as the mid-1990s, most of these early efforts mirrored the content of diocesan newspapers and church bulletins already used save in electronic form. Such efforts seldom attracted new readers and, because those who attend Mass and other religious services tend to be older than the general population, the numbers of believers who could access such services were initially few. Despite this, many Catholic dioceses, parishes, schools, social organizations, and other groups worked to develop a Web presence, something that proved beneficial when the more interactive social media platforms known as Web 2.0 became increasingly prevalent and popular.

As social media applications became more interactive, and as a greater percentage of the population became wired, a variety of dioceses, churches, schools, religious orders, and other local Catholic organizations became users of social media. From providing reminders of upcoming social events to conducting outreach activities to reach new members, these groups used a variety of social media to make the public aware of these and other opportunities. As social media users tended to be younger than the traditional Catholic, this permitted these local organizations to reach a group of the laity who had been difficult to reach. Because the Catholic Church sees what

it offers to the public as more important than a “product” or “brand,” those using social media found that they often needed focus on inspiration and movement building as ways to inspire and motivate those who engaged with it on Twitter, Facebook, YouTube, or other platforms.

Independent Catholic-Oriented Social Media

A variety of uses of social media have developed through third parties who, while often Catholics themselves, are independent of church control. Examples include Catholic Online (www.catholic.org), a for-profit Web site that is owned by Californian Michael Galloway. Catholic Online provides a variety of services to users, including links to news updates concerning the church and its members, lists of saints and their biographies, free e-mail accounts, shopping, dating opportunities, and other assistance for those curious about Catholicism. With an attractive and engaging interface, Catholic Online appears similar to a variety of other social media choices. As a result, it attracts many users who are not otherwise familiar with or members of the church. Other independent Catholic social media sites that are controlled by laypeople and independent of church control include Independent Catholic News (www.indcatholicnews.com), Catholics United for the Faith (www.cuf.org), Our Sunday Visitor (www.osv.org), and the National Catholic Reporter (www.ncronline.org). Such sites, which often use a variety of social media, cost the church nothing and often have design elements and features that are attractive to the lay public. As a result, the independent sites attract a variety of users who are more varied than do the sites run by the church itself.

Such independent social media sites are not without their own controversy, however. For example, the owner of Catholic Online has been involved in various disputes with former employees. Disputes such as this bring a certain level of disgrace and disrepute upon the church even though it is not involved in any way in the actions of the owners of the sites. Such independent sites often confuse the lay public, offering viewpoints that are inconsistent with church teachings and doctrine. Even when the message of such independent social media sites aligns with that of the

church, controversy can ensue. When Catholic Online posted comments on its Facebook page criticizing gay marriage, others who favored this attacked the account, causing it to be shut down for several hours. The often anonymous nature of the Internet often allows such attacks to go unchallenged, as it is difficult to ascertain who is behind them, much less to stop them.

Third-party-controlled social media sites also run the risk of affiliating the Catholic Church with products and services with which it does not wish to associate. A plethora of dating sites claim to be directed toward Catholics, for example. While most of these are harmless and provide a service of interest to many, a few such sites are written in a manner that others would find objectionable. Church authorities have, as a result, sometimes received complaints about Web sites, applications, and other social media over which they have no control. As such services continue to push the boundaries of good taste, such complaints will undoubtedly multiply.

Cato Institute

The Cato Institute is a U.S.-based public policy research organization guided by the principles of individual liberty, limited government, free markets, and peace. Its scholars and analysts are actively involved in conducting research on various policy issues while working to remain independent and nonpartisan. Often labeled as a libertarian “think tank,” the institute’s engagement in the public sphere is highly influential, particularly on economic and social policies. The Cato Institute does not support any political party including the Libertarian Party, and its position on topics such as immigration reform, gay and lesbian rights, gun control, foreign policy, and government spending align it with both Republicans and Democrats on different issues. The Cato Institute is influential on public opinion and on policy makers through Internet and social media outreach.

The mission of the Cato Institute is to increase the public’s understanding of public policies through the principles of limited government, free markets, individual liberty, and peace. The institute strives to provide clear and publicly accessible analyses of important public policy issues through a wide array of media. Its analysts appear as guests on television networks, make presentations at conferences and other speaking engagements, publish research reports and books, and write blogs and op-eds. Additionally the institute sponsors many of its own conferences such as the Annual Monetary Conference or the Conference on Health Care Reform, hosting notable scholars and specialists.

The Cato Institute’s online presence is notable in its effort to influence the public’s understanding of public policy issues. The institute maintains its own Web site in both English and Spanish, while also being responsible for other sites such as *Downsizing the Federal Government*, a proposal to cut the government’s budget department by department; *Libertarianism.org*, promoting the ideas of libertarianism from classical to

contemporary thinkers; and *Policemisconduct.net*, a project on reporting police misconduct nationwide. Additionally, *Cato Unbound* is a Web-only publication featuring a debate between four people with unlimited responses over a month. Other publications include *Cato Journal* and *Regulation*, both peer-reviewed, as well as *Cato’s Letter*, *Cato Supreme Court Review*, and *Cato Policy Report*.

Social Media

The Cato Institute and many of its analysts and scholars are actively involved in social media, particularly in its use of Facebook, Twitter, and YouTube. While the institute mainly uses social media to promote its Web-based content and upcoming events, its analysts are quick to weigh in on Twitter about relevant debates and current events as they unfold.

In early 2012, the institute turned to the public through the Web for support against pending lawsuits that threatened to change control of the organization. Cato started a Web site and Facebook page called Save Cato when the legal dispute became more public to present its position and encourage others to support it through social media. The lawsuits were brought by Charles and David Koch, billionaire owners of Koch Industries and supporters of numerous conservative and libertarian special interest groups and think tanks. The Save Cato site pleaded with the public to join the institute in persuading the Koch brothers to drop what Cato labeled as a takeover attempt. The dispute concerned control of shareholder seats, with the Koch brothers claiming protection of their legal interests while Cato’s position insisted its ability to remain independent was threatened. The lawsuits were finally dropped after an agreement was reached which the institute claims will allow its research to remain nonpartisan.

Background

Maintaining political independence allows the Cato Institute to declare itself as ideologically based rather than politically based. In addition to its resistance of more control by the Koch brothers, the institute also does not accept any government funding and instead receives its funding through private donations and book sales. Furthermore, the Cato Institute does not engage in

Participants at the Cato Institute–Wikimedia District of Columbia Legislative Data Meetup on June 8, 2013, at Cato Institute headquarters. The meetup provided an opportunity for WikiProject U.S. Federal Government Legislative Data participants in the Washington, D.C., area to discuss efforts to increase the amount of information about the U.S. government on Wikipedia.

any lobbying efforts or support any political candidates. Its scholars and analysts are known to be critical of both major parties at different times. Though often considered to have closer ties with elements of the Republican Party, there have been abundant criticisms of Republican office holders and the Cato Institute explicitly resists being tied to the conservative movement because conservatism connotes maintaining the status quo.

Founded in 1977 by Edward H. Crane and Charles Koch, the Cato Institute was named after a series of essays in 18th-century England known as Cato's Letters, Cato being a reference to Cato the Younger, the defender of republican institutions in Rome. The essays were written about a society free from excessive government power and were inspirational to many of the architects of the American Revolution. The Cato Institute believes that the principles of individual liberty, limited government, free markets, and peace are even more relevant and powerful today in an increasingly globalized world with unprecedented

access to information. The institute remains committed to expanding civil society, where individuals make choices about their own lives, while reducing the political society, where someone else is able to make or greatly influence those choices.

Though societies of the world are becoming more complex, the Cato Institute maintains the position that the appropriate answer to such complexity is not more centralized control and planning but less. The institute claims that socialism and government planning are not appropriate solutions for the modern world because a concentration of planning only works in simple societies where it does less damage. Centralized planning is outdated and inhibits social progress, and the institute's attempts to influence both policy makers and the public through the use of decentralized social media platforms can be one example of how it follows its ideology.

Cause-Marketing Campaigns

Cause-marketing campaigns, also known as cause-related marketing campaigns, are marketing campaigns dealing primarily with social and charitable causes. Such campaigns are often the result of cooperative efforts between for-profit and nonprofit organizations. In cause marketing, organizations are partners and strive to achieve their mutually agreed-upon objectives.

Cause marketing is considered a win-win situation. For nonprofit organizations, these campaigns are important activities for promoting their causes through the financial support of a business and for reaching possible supporters through a company's customer base. For the for-profit organization, a cause-marketing campaign is an important strategy for improving customer relations, its own image, and its brand positioning as a social responsible company, increasing its ability to attract, motivate, and retain employees; appealing to investors and financial analysts; and even boosting sales.

Sue Adkins defines cause-related marketing as an activity in which an organization uses money, techniques, and strategies to support worthwhile causes at the same time as it builds its business. Although the distinction is not always so clear, cause marketing differs from philanthropy or

corporate giving because the latter generally involves a money donation by a for-profit organization to a nonprofit one with no direct involvement of the for-profit organization in the cause, and the donation is tax deductible. By comparison, cause marketing is a marketing activity in which an organization with a product, service, or image to market builds a relationship with a cause for a mutual benefit.

Cause marketing can take many forms; for example, it can be associated with sales promotion techniques where a product purchase leads to a donation to a charity or a cause or with product licensing, endorsements, and certifications, like the case of the American Heart Association's stamp of approval on Cheerios, a breakfast cereal produced by the company General Mills, for its low-fat and low-cholesterol standards, but also through employee service programs or simply with the promotion of a common message. Gordon Liu and Wai-Wai Ko indicate as the most common cause-marketing implementation strategies sponsorship, transaction-based, joint promotion (for example through cooperation with regard to advertising efforts), and in-kind, nonfinancial corporate contributions. These four strategies represent four distinct ways of implementing cause-marketing campaigns. These are not mutually exclusive; an organization can employ different strategies for the same campaign.

Cause-marketing campaigns have been recently used for political causes, too, as a way to increase citizens' involvement. In the 2012 U.S. presidential elections, for example, the Kenneth Cole Foundation, a foundation created by the American fashion designer Kenneth Cole in association with Emory University and Rock the Vote, a nonpartisan American nonprofit organization whose mission is to engage and build the political power of young people, announced the launch of an innovative retail program that encourages voter registration. The program aimed to raise awareness about the importance of voting by allowing Kenneth Cole's customers to register their votes in stores and online. Customers could also show their support for the cause by purchasing a limited-edition tote with the message "Rock the Vote (and the tote)."

Virgin America, an American airline company, was also a partner of Rock the Vote and engaged

in this cause by creating a specific campaign called Both Sides of the Aisle Win. Passengers on Virgin's Washington, D.C.-to-San Francisco flights could register to vote midflight by scanning a quick response (QR) code on the airplane's backseat screens. Another example of political-cause and cause-marketing campaigns is the Patagonia case. Patagonia, an outdoor clothing and gear company, embarked on a cause-marketing campaign in the summer of 2012 before the U.S. presidential election with its Vote the Environment campaign, in conjunction with nonprofit partners HeadCount and the left-leaning League of Conservation Voters. As with the Kenneth Cole Foundation and Virgin, the scope of this cause-marketing campaign was to motivate consumers to register to vote. However, in this case, Patagonia sponsored a specific political cause, environmentalism.

Although cause marketing was originally a marketing strategy that occurred offline, today it is more and more often conducted online, for example, with the establishment of online charity auctions. Organizations can create programs to help sellers and corporations donate a percentage of their sales to a nonprofit organization through the use of auctions.

History

It is believed that cause marketing is a practice that has been long employed by organizations to convey specific messages around their corporate identities and to link with the public and local communities. An example of early marketing activities associated with a cause is the case of William Hesketh Lever, an English business owner of a soap and cleaning product company—Sunlight—who introduced gift schemes in 1890 with the intent to donate a monetary prize to a charity on the basis of consumers' voting, which was possible only by purchasing Sunlight products first.

It was, however, only in more recent years that cause marketing became a thoughtful and planned strategy by organizations. Sue Adkins points to the early 1980s as the time for cause marketing's real beginning and American Express, an American multinational financial services corporation, as the pioneer of cause marketing. In 1981, American Express developed a cause-marketing campaign for donating funds to different nonprofit organizations as a part of the San Francisco Art

Festival. For each purchase made by a customer with an American Express card, the company donated an amount of money to the cause. In 1983, the same company got engaged in another cause-marketing campaign, this time to support the restoration of the Statue of Liberty. The restoration of the Statue of Liberty was a successful initiative as the company was able to donate \$1.7 million in three months. Sue Adkins reports that American Express engaged in more than 90 causes in 17 different countries in the years to come, clearly indicating that the company saw both a commercial and a social interest in developing specific cause-marketing campaigns.

After American Express, many other organizations decided to engage in different cause-marketing campaigns in order to boost profits, increase reputation, and improve brand positioning. According to the Cone 2010 Cause Evolution Study, which is a study exploring consumer attitudes and expectations of companies' support for social and environmental issues, cause marketing continues to grow among organizations, and consumers are expecting even more. The results of this study conducted by Cone Communications, a public relations and marketing agency, indicate that about 83 percent of Americans want more of the products, services, and retailers they use to support causes.

This indicates that consumers are extremely sensitive to an organization's commitment and involvement in social causes and may switch from one brand to another of a comparable product and price if the latter brand is associated with a "good cause." However, Philip Kotler and Nancy Lee underline that the organization's commitment in a cause has to be perceived by consumers as genuine to avoid consumers' rejecting claims of cause-marketing campaigns. Furthermore, the organization needs to clearly ponder which cause to support as some customers may have concerns about the charity the brand is associated with and may not want to purchase the product as a result. Overall, cause-marketing campaigns can be beneficial for organizations that have existing, long-term associations with a cause or charity and if the effort is perceived as an authentic, natural extension of the apparent commitment.

of citizen resources that promote civic engagement and participation in local, national, and global affairs. In recognizing that new technologies have a critical impact on human communication, CCCE seeks to understand new challenges and opportunities for civic engagement through its operation of a number of projects. Projects include the organization of public events, reports, conferences, and curriculum that address the need to understand shifts in human communication by assessing the present state of the media and changing political climates.

The CCCE maintains an intellectual agenda that motivates and reinforces the range of diverse interests represented in CCCE activities. Its organizational philosophy recognizes two distinct views of social and political change. One perspective claims that civic life is declining as a result of decreased psychological importance and organizational coherence of traditional politics. A different school of thought suggests that political participation continues to thrive, however, it is represented in a new form; in response to changes in society, old patterns of civic life are being replaced to meet the needs of contemporary personal lifestyles. In line with the latter view, the CCCE believes that new concepts and methods are required to study these emerging representations of politics and citizenship. In particular, new research should be designed "to identify new patterns of communication and civic engagement in order to understand the way in which they fit with more traditional political communication forms, and to compare those patterns across different societies."

As defined in its intellectual agenda, CCCE research addresses five broad areas of interests. First, it seeks to "reassess traditional media and citizen information needs" by considering the decline of traditional media gatekeeping and the rise of emerging news networks and communication channels. Second, it attempts to understand "the rise of 'lifestyle' politics," a concept that suggests that traditional political appeals are being replaced with consumer-based value appeals that address quality-of-life concerns, such as those related to the environment and personal rights. Third, the work of the CCCE addresses "the decline of common political experiences," thus recognizing that the Internet has allowed traditional forms of political engagement to be replaced by virtual

Center for Communication and Civic Engagement

The Center for Communication and Civic Engagement (CCCE) at the University of Washington is dedicated to research and the creation

communities that enable individuals and activists to act on a global level. The fourth area covers questions about “the changing politics of digital media and the Internet,” which primarily involves the investigation of issues surrounding Internet-based issue advocacy campaigns. And finally, the fifth area in CCCE’s intellectual agenda seeks to understand “global activism and large-scale public networks” by examining the characteristics of global cause networks.

Projects

The interest areas outlined above are explored in an extensive index of CCCE projects. For example, the organization has created multiple “Learning Communities” whose participants include students, faculty, and practitioners who work on projects that link the University of Washington to community organizations. Becoming Citizens is one Learning Community that allows University of Washington students to intern at local schools and community centers, where they facilitate civic engagement projects. In Spring 2012, 12 Becoming Citizens interns met with students once a week in various community sites and taught civic engagement skills to students using digital media. They assisted students in creating short videos about prevalent civic issues such as youth violence, healthy living, and the environment.

Another CCCE project, Developing Technologies for Public Engagement and Deliberation, aims to introduce civic technologies into actual political contexts in an effort to improve public deliberation in online communication forums. With support from a \$730,000 three-year grant from the National Science Foundation, this project is led by an interdisciplinary group of scholars from the University of Washington, which include Lance Bennett, Alan Borning, and Travis Kriplean. This research team implements several online platforms that are designed to achieve measurable improvements in various areas of political behavior. Additionally, communicative outcomes produced by the project’s interactive online platforms enable public officials to gain insight into the needs and opinions of citizens.

The CCCE is also dedicated to tracking and studying activist and issue campaigns. According to its Web site, the CCCE is particularly interested in individual campaigns that “redefine

the boundaries of traditional politics and communication.” Specific campaigns that have been identified for analysis have included the Nike Anti-Sweatshop campaign and the World Trade Organization campaign. The CCCE considers citizens’ activities surrounding these campaigns with an emphasis on monitoring the role of the Internet in shaping the course of these campaigns. In its research, the CCCE refrains from advocating a particular position, instead focusing on providing an understanding of how it works.

The CCCE has hosted several conferences, workshops, and speakers on the University of Washington campus. For example, in January 2009, the center hosted a media-election workshop to discuss the roles of traditional media and new media during the 2008 electoral campaigns. In May 2000, the CCCE hosted the two-day Communicating Civic Engagement in Europe and the United States conference, which featured an array of participants from universities throughout the world.

Directors and staff, as well as faculty and students across the University of Washington, support the coordination of CCCE research, learning, and outreach activities. While the center is housed in the department of communication, it is cosponsored by the political science department and scholars are represented from a range of academic disciplines including political science, geography, computer science and engineering, and information science. The CCCE’s organizational model has been praised for its capacity to effectively integrate higher education resources with community organizations. Using an academic institution as the center’s hub, this organization has built public services that increase community participation in civic activities.

The CCCE recognizes the historical significance of new technologies in changing the ways that humans participate in public affairs, and it is dedicated to understanding new challenges and opportunities for civic engagement.

Center for Democracy and Technology

The Center for Democracy and Technology (CDT), based in Washington, D.C., is a nonprofit public policy organization. The CDT works to influence technological policy innovation with the overarching goal of keeping the Internet open, innovative, and free. The CDT was instrumental in shaping early Internet legislation and has advocated for policy and protections as the Internet has evolved.

The CDT believes that the unique, open, decentralized, and user-controlled nature of the Internet and its ability to foster opportunities for innovation, democratic participation, and human development must be preserved. The CDT focuses on enhancing freedom of expression by fighting for the rights of individuals to freely and openly communicate, publish, and access online information. It opposes any level of governmental censorship that threatens, or perceives to threaten, the free flow of information online. The CDT believes that the key to appropriate Internet usage lies not within governmental control, but rather within technological tools that allow individuals to engage with the Internet in the manner best suited to them personally. It also promotes the idea that online privacy is best protected via a mixture of laws, corporate policy, and technological tools that give individuals control over their personal information. The CDT advocates for limiting

governmental surveillance protocols and calls for stronger legal standards protecting personal information in digital environments.

Research and Analysis

The CDT provides research and analysis, in the form of reports, papers, and commentary, on a wide variety of issues related to Internet freedoms and governance. It also produces policy posts, in-depth analysis on current technological policy issues, testimonies, and other reports from CDT experts. The CDT monitors various issues of technological concern in order to provide the public with timely and reputable information.

A primary area of research and analysis for the CDT is information and policies related to free expression. While broad in nature, the CDT focuses its analysis most specifically on issues of online child safety, intermediary liability (a section of the Telecommunications Act of 1996 that provides broad immunity for online service providers with respect to material posted by third parties), Internet neutrality (standardized technological protocols that enable Internet innovators to distribute content and services without seeking permission), the Children’s Online Privacy Protection Rule (COPPA), and international free expression, which focuses on deterring unilateral global legislation that may serve to threaten the Internet’s vitality and freedoms.

Consumer and health privacy are another area of concern for the CDT. The organization provides information related to consumer privacy on issues of behavioral advertising (consumer profiles created by compiling detailed information about an Internet user’s online activities), spyware (programs on computers that open security holes for users), identity management, baseline privacy law (basic privacy protections that apply across the life cycle of consumers’ data), and data security. Related to health privacy, CDT provides information on consent, the 1996 Health Insurance Portability and Accountability Act (HIPPA), privacy enforcement, and state privacy protections.

The CDT also provides research and analysis on issues of digital copyright and Internet openness and standards. Regarding digital copyright, the CDT provides information on graduated response policies (policies that call on Internet service providers to take action against subscribers

The Center for Democracy and Technology believes in the freedom to communicate, publish, and access online information and opposes governmental censorship that threatens, or perceives to threaten, the free flow of online information.

suspected of online copyright infringement), secondary liability (policies that hold service providers liable for infringement committed by users), digital rights management, and international copyright. On Internet openness and standards, CDT has compiled research on Internet governance, technical standards, and neutrality.

Aligning with one of the organization's core beliefs, the CDT provides substantial research and analysis on governmental security and surveillance. Information related to this issue includes information on the Electronic Communications Privacy Act (ECPA) of 1986, which specifies standards for government monitoring of Internet communication and cell phone conversations; the PATRIOT Act, which provided expanded provisions for government surveillance in the United States and to access records about individuals, including citizens; cybersecurity; and terrorism information sharing (the development of domestic intelligence gathering that the CDT theorizes endanger freedom of expression, privacy, and other civil liberties).

Initiatives

A primary initiative for the CDT is leadership and advocacy that assists in shaping the direction

of governmental policy and industry practices. Through ongoing working groups, the CDT brings together companies, trade associations, public interest groups, technologists, and academics to facilitate communication and seek collaborative opportunities. These working groups focus on issues such as government privacy and security issues, consumer privacy, and free expression. CDT also collaborates with a range of Internet stakeholders and is committed to fostering dialogue that produces implementable discussions on how to best protect and preserve the nature of the Internet. The CDT collaborated with companies and advocates to successfully argue for First Amendment protections for Internet communication before the U.S. Supreme Court. It also worked with Congress to pass legislation shielding Internet service providers (ISPs) from liability related to user-generated content and created the Anti-Spyware Coalition, credited with improving trust and security on the Internet. The CDT is also credited with helping shape new health policy protections and supporting the development of innovative technology vital to better health care.

Conclusion

The Center for Democracy and Technology is concerned with building consensus-driven coalitions among Internet stakeholders with the central focus of finding practical and balanced solutions to contemporary policy challenges in the evolving Internet environment. Through research, analysis, and involvement in various policy and legislative initiatives, the CDT consistently works toward its goal of keeping the Internet open, innovative, and free.

Center for Information Technology and Society

The Center for Information Technology and Society (CITS), at the University of California, Santa Barbara, was founded in 1999, on the 30th anniversary of the birth of the Internet. The center functions as a unit within the University of California (U.C.), Santa Barbara's Institute for Social, Behavioral, and Economic Research. The center is composed of faculty from 13 university departments, with diverse disciplinary backgrounds, who study similar phenomena related to technology and society. The overarching goal of the CITS is to forward research related to contemporary information technology across engineering sciences, the social sciences, and the humanities. Through formal events, public presentations, informal meetings, and a graduate degree emphasis, CITS forwards its mission to apply the knowledge gained from multidisciplinary endeavors to understand the multitude of ways that information technologies are developed, used, and impact contemporary society.

Core Beliefs and Activities

Funded by private gifts, the university, and research grants, the CITS hosts monthly lectures, conferences, workshops, and speakers, and supports a variety of working groups.

The CITS examines the technological developments that are stimulating complex social innovations and profoundly altering the ways that people live, work, and interact. Additionally, CITS research looks at how individuals repurpose and reconfigure technologies as they adopt and adapt to these technologies. A central belief of the CITS is that multidisciplinary research efforts are vital to increase the collective knowledge and understanding of technologically moderated cultural transitions and social innovations. It is

through interdisciplinary engagement that the CITS works to not only research, but also create technology, and parse out the social understandings that may be embedded in new technological innovations. Additionally, through both investigating and creating technology, the CITS connects technology with humanity by producing research that explains how people use, adopt, adapt, and create technologies in order to participate in society.

The CITS engages in three primary types of activities: research, education, and connecting people. The primary focus of the center is research. Research teams are composed of internationally recognized scholars who investigate the dynamic, technologically driven environments pervasive in contemporary organizations and society, how society and social groups are affected by technology, and how social dynamics impact technological innovation and diffusion. The CITS also focuses on refining and teaching the skills involved with developing the next generation of researchers, inventors, educators, policy makers, and citizens. Through educational initiatives, such as a Ph.D. emphasis in technology and society, and the involvement of undergraduate and graduate students in their research, the CITS teaches the skills involved in understanding trends and evolutions in technological and sociological environments.

An emphasis on interdisciplinary training and intensive faculty involvement prepares students for a variety of future careers related to research, teaching, policy making, and the technology industry. Finally, the center focuses on connecting people. Through public lectures, conferences, media outreach, multimedia content on its Web site, and a quarterly newsletter, the CITS engages various academic units within U.C. Santa Barbara, other academic institutions, the industry, policy makers, and the public in a broad and vital conversation about the multifaceted dynamics of information technology and society.

To promote and share the research of the CITS, the center hosts a variety of public events and speaker series aimed at connecting on-campus and off-campus audiences in conversation about the role of technology in contemporary life. These presentations center around a wide variety of topics, such as the relationship between

the mind, brain, and virtual reality, communication and consumption, the history and use of air war and drones, the digital divide, and conversation roundtables with faculty and graduate students. Presentations sponsored by the center are archived on its Web site and available for viewing by the public. The CITS also hosts workshops, such as the Santa Barbara Forum on Digital Transitions and the Santa Barbara Social Innovation Design Charrette on Digital Advocacy, that bring academics and practitioners together for collaboration.

Research Initiatives

The CITS conducts worldwide investigations of information technologies and their impact on all aspects of human existence. The center is composed of a diverse team of over a dozen researchers who, in addition to conducting research, also organize public forums and facilitate partnerships with the technological industry and the public sector. In addition, CITS faculty work to improve technological engineering through the incorporation of social insight into the process of technological innovation. The center's research initiatives are diverse and range from explorations of social computing, to the use of technology in classrooms, to how technology is used in organizing community events. The research examines many aspects of contemporary social and cultural transitions, but focuses most specifically on the distinct areas of civic engagement and the transformation of community, global cultures, and learning and information literacy.

The center's research on civic engagement and community focuses on social collaboration and dynamic communities. It examines the ways in which the structures of communities have been and will always be inextricably tied to technology. This research realizes that human engagement is moderated by the technologies of the Industrial Revolution and their immediate successors. CITS research on global cultures focuses on multidisciplinary methods for visualizing social and cultural differences and disparities created by global communication technologies. Finally, the center's research on technology in education examines the adoption, application, and most effective use of instructional technology in a variety of educational environments.

Conclusion

The Center for Information Technology and Society is dedicated to exploring the cultural transitions and social innovations associated with technology. Through research, activities, and educational opportunities, the CITS works to produce insight into the relationship between technology and society.

Center for Innovative Media

The Center for Innovative Media (CIM) at George Washington University (GWU) aims to spark and inspire debate across different media platforms. The center's flagship projects to date include the Public Affairs Project, the Documentary Center, Conversation Series, and Face the Facts. Each project utilizes social media to begin dialogue surrounding innovative ideas addressing global challenges.

The Center for Innovative Media is part of the School of Media and Public Affairs of the Columbian College of Arts and Sciences at GWU, a coeducational private university in Washington,

D.C. GWU has been ranked one of the top 10 most politically active college campuses in the country. The programs offered through the School of Media and Public Affairs reflect this title. The school offers an interdisciplinary program of media, public affairs, and politics that focuses on the changing political landscape in the digital age.

Flagship Projects and the Influence of Social Media

Planet Forward, a project with the Public Affairs Project, is a social network in and of itself where global issues such as sustainability, climate change, and green energy are discussed and evaluated. The platform goes beyond engaging with students at GWU to include citizens, scientists, experts, and business leaders with opportunities to discuss issues and, ideally, find solutions.

As a platform hosting user-generated content, Planet Forward allows users to submit their comments and suggestions on a number of climate-related topics, such as water conservation, nuclear energy, geothermal energy, solar power, science, business factors, campus sustainability, hydroelectric power, recycling, public transportation, and natural gas. Each of the landing pages for the different topics features a clickable call-to-action button to allow users to submit their ideas and sentiments. Planet Forward tips the traditional top-down format of media by allowing for contributors to start the conversations and compete to find the best ideas.

Also housed in the Public Affairs Project is the Center for Innovative Media's Conversation Series, which offers GWU students a unique look at the Washington political and national media landscape with compelling dialogues with leading journalists and policy analysts. Students are no longer viewers of a conversation but participants as they have the option to submit questions via Twitter live during conversations. Frank Sesno, director of the center's Public Affairs Project and former CNN bureau chief, hosts the live conversations. Guests on the Conversation Series have included Hillary Rodham Clinton, Tom Ridge, Walter Mondale, Chuck Todd, Ted Turner, and Dee Dee Myers.

Deemed one of the top 10 documentary programs in the country, the Documentary Center, directed by filmmaking Emmy Award-winning

Nina Gilden Seavey, has been in existence for more than 20 years. The center offers courses in the theory and practice of documentary films and international fellowships and exhibits work from new and established directors and producers.

The program has six primary goals: to teach documentary filmmaking principles and methods; produce high-quality films for national and international audiences; host symposia, seminars, and screenings that foster dialogue about the state of documentary films both past and future; encourage the production of documentary films by global emerging filmmakers; consult with independent filmmakers, traditional broadcast outlets, and emerging outlets on the distribution of films; and forge a community of new and established filmmakers at home and abroad.

The center's global presence makes it a forceful figure in the world of public affairs. Similar to other projects sponsored by the CIM, it casts aside traditional roles and allows new filmmakers, seasoned producers, and independent developers to discuss films and the state and purpose of documentaries.

Other CIM research conducted by its associate director Kerric Harvey explores the theoretical implications and policy usefulness of new media storytelling formats when they are imported to online and virtual environments, especially as innovative techniques for conflict mediation both within and across troubled cultures and communities. The Halloween 24-Picture Day Project used the video capture function of everyday cell phone cameras as the basis for an interactive ethnography, in which male and female experiment participants were able to explore the same city, on the same night, from the perspective of highly contrasting perspectives about urban safety.

During the watershed 2010 midterm election, the Twitter Election Day Drama and Poetry Project explored ways in which Twitter—one of the fastest growing types of social media—might be used ethnographically within the political sphere. An original radio program emerging from this experiment was produced at GWV's Global Media Institute and enjoyed six broadcasts on XM Public Radio (Sirius) and the Federal News Network throughout December 2011.

To date, the latest initiative by the CIM is Face the Facts USA, which aims to cut through the

confusing political rhetoric and provide truthful facts to allow for knowledgeable and accurate discussions. The project seeks to not only provide accurate information but also facts that are compelling, memorable, and creative. The primary criteria for facts are that they must be relevant and provocative. All facts are developed from a research team with the CIM, screened by veteran editors, and verified by professional fact-checkers.

Face the Facts USA utilizes social media to engage university students and citizens to have conversations. This user-generated site allows viewers to host a Face the Facts Discussion, which is a 90-minute conversation with friends, colleagues, or community members about a big issue facing the United States. Face the Facts USA goes beyond traditional fact-checking sites to seek out viewer input and choose topics that are compelling and meaningful to those in the United States.

Center for International Media Assistance

The Center for International Media Assistance (CIMA) is an initiative by the National Endowment for Democracy, a U.S. nonprofit organization that promotes democracy. The center works to support efforts of independent journalists and

media and their effectiveness in developing countries around the world. In addition to assembling work groups, research reports, and events, the CIMA distributes a comprehensive list of digital media information and maintains a bibliographic database of international media assistance resources. Ultimately, the CIMA believes that independent media is critical in the world today and works to promote and maintain its presence.

In 2008, the center's first report became the first of its kind to examine the field of media development. *Empowering Independent Media: U.S. Efforts to Foster Free and Independent Media Around the World* spearheaded the organization's mission and provided an in-depth, analytical look at U.S. international media development efforts.

The organization differentiates between media development and media for development. According to the CIMA, media development seeks to develop the media sector in a country as an end in itself, while media for development uses the media to convey specific messages on issues, including health care, poverty reduction, the environment, and governing. The organization affirms that both are needed to achieve balance within the field and be sustainable. For countries that are struggling economically and politically, the CIMA believes that media assistance is crucial in spurring a revival and placing accountability on those in charge.

Developing Countries

At home and around the globe, social media has changed how traditional journalists gather information and has empowered individuals to join the conversation. This is particularly powerful in developing countries seeking to gain truth and promote justice. The CIMA believes digital media is changing the media landscape in a number of ways.

In many ways, social media is placing power in the hands of the powerless. Citizen journalists have emerged as the population of users worldwide accessing the Internet and cell phones has increased. Ordinary citizens can create blogs, which many turn to instead of traditional news coverage for breaking coverage or opinion articles. Blogs are enormously popular worldwide with the CIMA reporting 113 million blogs worldwide in 2012—with only 36 percent in English. More

important, there is no longer a gatekeeper of what media are distributed. Users can share and connect with each other and completely bypass traditional outlets.

Many activities, such as violence or corruption, would often go unreported if it weren't for the democratization of media and citizens owning cell phones and capturing scenes and posting to Twitter or Facebook. It is not that social media necessarily influence or command the public to act, but it acts as a means for information to spread faster and thus organize acts. For instance, many credit Twitter and Facebook for the swift organization of protesters during the 2009 Iranian elections. Many news outlets turned to these outlets to gather information. Similar results occurred in 2011 when word spread on Twitter and Facebook that protests were scheduled for January 25 in Egypt. The social media tools offered a means of organization and provided courage to many citizens that perhaps would not dare risk death or imprisonment without knowing others were alongside them.

Noteworthy Reports

The CIMA has crafted many reports documenting the role of social and digital media in developing countries. *Digital Media in Conflict-Prone Societies*, released in October 2009, examines how social media bridges the information void that so often exists in areas of conflict or war. Political unrest makes access to these regions difficult for traditional journalists, although those who live in those countries can share their experiences in vivid manners. Not only is the decimation of information quicker, but the report notes that digital media tools can foster peace and build communication systems that foster healthy dialogues and nonviolent political solutions.

Social media is significant in developing countries not just from a citizen journalist standpoint, however. It also serves as an equalizing factor. *Bigger Cities, Smaller Screens: Urbanization, Mobile Phones, and Digital Media Trends in Africa* examines how a farmer in Africa can access the same information via his or her cell phone as a man on Wall Street in New York. The convergence of African urbanization and technological change is a major driving force within the country as a means of information.

The CIMA hopes that its advocacy efforts will not only allow for the continued growth of media in developing countries, but that awareness will be raised to the necessity of media assistance for political and economic stability in all countries.

Center for Internet Studies

The Yale Center for Internet Studies (YCIS) began with the goal of understanding the effects of the Internet on society and the influence of society on the Internet. The YCIS was founded in 1998 by codirectors David Gelernter and Robert Dunne, computer science professors at Yale University. While housed in the Department of Computer Science, the YCIS was an interdisciplinary center that included perspectives from social science, humanities, business, and law. Building on Yale's strength in public policy, the center especially sought an understanding of public policy as it relates to the Internet. From its beginnings until the mid-2000s the YCIS hosted research fellows and sponsored colloquiums and roundtables

covering such Internet studies topics as the Digital Millennium Copyright Act and e-commerce. In its efforts, the YCIS collaborated with other universities and technology companies such as Sun Microsystems, IBM, and Mirror Worlds Technologies. The YCIS is currently inactive.

The Center for Internet Studies grew out of the strong interest Yale students had in Gelernter and Dunne's Internet-related courses in the late 1990s. By 2001 Internet studies had emerged as an area of study at U.S. universities, according to the *Chronicle of Higher Education*. In 2001 Brandeis University offered the first Internet studies undergraduate major. A few years previously, Georgetown University began a master's degree program in Internet studies. Also, the Association of Internet Researchers was founded in 1999 and the Oxford Internet Institute in 2001.

In this milieu, Gelernter and Dunne established the YCIS. Dunn, a popular professor at Yale, taught courses on the Internet and law. The courses covered such topics as constitutional rights on the electronic frontier, censorship, and privacy. Dunne codirected the center and taught his courses until his untimely death in 2008. A textbook based on his course was finished and posthumously published in 2009 as *Computers and Law*. As an attorney, Dunne also served as legal counsel to then new Internet companies, including Mirror Worlds Technologies, a company that sponsored the YCIS and was cofounded by Gelernter.

The *New York Times* called Gelernter a "rock star" of the computing world. Bill Joy, the founder of Sun Microsystems, referred to him as a computer science visionary. Gelernter's 1991 book *Mirror Worlds* foretold the World Wide Web, search engines, and aspects of social media. In 1993, in response to the book, Ted Kaczynski, also known as the Unabomber, sent Gelernter a mail bomb that severely burned Gelernter and caused permanent damage to his right eye and right hand. Kaczynski opposed technological advances and the ill effects he saw that they brought on society.

In the mid-1990s, along with a Yale Ph.D. student, Eric Freeman, Gelernter used concepts from his book to develop a new paradigm of computing. Instead of the space-oriented desktop metaphor of personal computing, they proposed "a time-ordered stream of documents that functions

as a diary of your electronic life; every document you create and every document other people send you is stored in your lifestream." Aspects of time-oriented streams can be seen in today's social media, for example, in blogs, Rich Site Summary (RSS) feeds, Twitter, and especially Facebook's Timeline. In the late 1990s Gelernter and Freeman commercialized their lifestream work and founded Mirror Worlds Technologies, which sold a livestream type of software called Scopeware to businesses. However, due to poor sales in 2004 the company ceased operations. Gelernter continues to be a strong proponent of the lifestream approach to computing. At the time of this writing, Gelernter and Freeman were working with Lifestreams Technologies Corporation, which is developing a browser-based app (see Lifestreams.com).

Center for Responsive Politics (OpenSecrets.org)

Money being sourced into the political arena can lead to some voices being heard louder than others as donors attempt to influence voters, elected

officials, and legislation. With Americans more concerned than ever about the transparency of their government, the Center for Responsive Politics, a social media outlet, has altered mainstream political agendas when reports on the OpenSecrets Blog broke national news, such as stories on health care reform and political donations to National Football League teams.

The center, headquartered in Washington, D.C., provides a comprehensive unbiased resource on federal campaign contributions and lobbying data, mainly through its Web site www.OpenSecrets.org. The analyses that are generated shed light on money spent to influence both federal elections and the policies that have an impact on Americans. Their nonpartisan goal is to advocate for a transparent and responsive government.

The Center for Responsive Politics was founded in 1983 by U.S. Senators Frank Church (D-ID) and Hugh Scott (R-PA). Before widespread use of the Internet, the center revolutionized the world of politics by publishing books that reported the spending patterns of interest groups and major industries, including the patterns of political action committee spending. This momentous task had never before been undertaken by any other organization.

OpenSecrets.org, launched in 1996, is a clearinghouse for data and analyses on political dollars, such as outside spending, federal lobbying monies, federal earmarks, and personal finances of elected officials. The Web site has received many awards, including the 2011 Online Journalism Award as well as several Webby Awards. Along with several full-time researchers, it employs reporters, office personnel, outreach staff, and interns that work to accomplish its mission. The organization is overseen by a board of directors, which includes financial moguls, professors, attorneys, and advocates.

The bulk data sets, provided at no charge by the center, are frequently used by journalists and academics. OpenSecrets.org is often cited by major news corporations, such as CNN, the *New York Times*, and National Public Radio. The center offers workshops on how to conduct computer-assisted research, how to responsibly report data, and how to best use OpenSecrets.org. Organizations such as the *Wall Street Journal*, the National Press Foundation, and the

Society of Professional Journalists have taken advantage of this training.

Researchers using the center's databases can identify which political candidates are receiving money from interest groups, such as tracking the patterns of tobacco company contributions over the past 10 years. For each interest group, a contribution breakdown by type and political party that dates back to the 1990 election cycle is provided. Also available is a list of companies by industry that have provided the most combined political support through their employees and political action committees. Other data available include special interest group and lobbyist spending. Donations to and campaign contributions from political action committees are detailed. Committees with foreign connections are identified. Advocacy group spending is revealed. Candidate spending on elections, including those who have dropped out, is profiled. Financial profiles, investments, and personal finances of politicians are overviewed, including an identification of the most wealthy members of Congress. Users can even learn which public relations firms have signed former White House employees and which interest groups are hiring former members of Congress to lobby on their behalf.

The center also follows giving that is not mandated to be registered. For example, researchers provide reports that break down the spending by politically active nonprofits. The center also identifies trends, such as how the earmarks for federal funding for organizations, companies, projects, and groups are linked to political budgets. The financial support of these congressional earmarks is also identified. Additionally, political party fund-raising is overviewed, individual and soft money contributors are listed, and the most expensive races and campaign contribution limits are identified. A local feature provides profiles by city, by zip code, and graphically for the lay researcher.

The center earns income through custom research services and licensing data for commercial use to provide capital to operate and to support legislation that advocates for continued governmental transparency. The center also receives outside funding through a combination of grants from foundations and individual donations. No contributions are accepted from businesses, labor

unions, or trade associations. Its most sizable charitable donations are received from the Ford Foundation, the MacArthur Foundation, the Open Society Foundations, the Rita Allen Foundation, the Rockefeller Brothers Fund, and the Ham Rove Memorial Fund of Coastal Community Foundation of Stephen Colbert. In December 2011, the total assets of the center were reported on its Internal Revenue Service form 990 as \$1,802,834.

Through education and outreach, a free and accessible database, research and analysis, and a custom research service, the Center for Responsive Politics allows users to explore the connections between money and politics. The center is positioned to continue to be one of the premier social media outlets in revolutionizing politics for years to come.

Center for Social Media

The Center for Social Media at the School of Communication at American University in Washington, D.C., was founded in 2001. Through partnerships with many organizations, such as the National Alliance for Media Arts and Culture, Filmmakers Collaborative, the Public Broadcasting Service (PBS), the American Civil Liberties Union, Filmmakers for Conservation, and Centers for Environmental Filmmaking, the Center for Social Media produces research and hosts

public events exploring the fast-changing environment of public media.

Initiatives

A primary goal of the center is to investigate and set standards for socially engaged media-making. Through its work, it helps create codes of best practices for many forms of media and incubates media strategies. The center focuses on encouraging a public media environment that supports civil society and democracy and promotes ways to use media as creative tools for public knowledge and action. While a great deal of the center's work focuses on the evolution of documentary films and video in a digital era, it also maintains a Web site that serves as an information clearinghouse for filmmakers, activists, and scholars.

The center's Web site provides information and best practices on fair use and free speech for documentarians, media practitioners, and educators. This information is designed to help individuals better interpret and apply fair use under U.S. copyright law and to understand how and when it is legal to use copyrighted material in media projects. This information also serves as a useful tool for media criticism and freedom of expression. In collaboration with the Washington College of Law, the information on the Web site provides tools for media creators, teachers, and researchers to better practice their fair use rights. The center also provides teaching materials, codes of best practices, documents, and online videos to help individuals best enact the fair use doctrine.

In addition, the center provides users a wealth of information regarding best practices for multiple types of media education and production. Information is provided regarding effective application of OpenCourseWare (OCW) for academic and research libraries. The OCW movement is part of a larger open educational resources (OER) movement that strives to provide high-quality digital education tools and resources freely and openly to anyone with Internet access. The information provided by the center assists educators in making course material available as widely as possible to public-access users.

The center also provides information on best practices for media literacy education and journalism (both practical and theoretical). A media literacy guide identifies principles that adhere to

contemporary community consensus regarding acceptable practices for use of copyrighted materials whenever and however they occur. Drawing upon interviews from practicing and former journalists, the center produced a report for journalists and educators detailing the ways in which journalists should encounter copyright issues and how these issues can affect the practice of journalism as a field. The report provides examples about the cost of not understanding proper copyright implementation in daily journalistic practices and provides suggestions for avoiding unnecessary mistakes. The information is also geared toward assisting journalists in asserting proper journalistic principles when making fair use decisions.

Focusing on one of the center's primary areas of expertise, the Web site also offers substantial information for filmmakers and online video producers regarding the best practices in the making of online video and the application and interpretation of fair use in this process. The center has also coordinated with documentary filmmakers and professional associations to produce a clear and precise statement of fair and reasonable approaches to fair use.

The center also provides reports on various topics, such as ethical challenges in documentary filmmaking, practices for sustainable filmmaking, the evolution of public engagement, understanding documentary audiences, creating truly public media, digital storytelling, socially engaging public access projects, and policy guides for independent filmmakers.

Events and Documentaries

In addition to providing media creators, practitioners, and educators with a wealth of free information through its Web site, the center also hosts conferences, film screenings, and other public events. The center's Media that Matters conference shares with participants cutting-edge practices designed to assist established and aspiring filmmakers, nonprofit organizations, funders, and students. Workshops at this conference include media entrepreneurship and understanding and applying fair use, and also offer participants the opportunity to showcase current projects for presentations and critique at group strategy sessions.

At the center's Repurposing and Rights: A Non-Profit Summit conference, public broadcasters,

librarians, archivists, scholars, lawyers, and new media experts convened to discuss the repurposing of audiovisual elements in a digital era. Topics included problems with third-party rights, the challenges and opportunities of digital rights management (access control technologies that are used by hardware manufacturers, publishers, copyright holders, and individuals with the intent to limit the use of digital content and devices after sale), and use of contracts.

The Web site also provides the public with access to timely documentaries on issues of social concern and importance. These documentaries cover a variety of topics, such as terrorism, homophobia and gay rights, the role of U.S. women in military combat, and preventing sexual violence. The Web site also provides video focus group interviews with established documentary filmmakers.

Conclusion

The Center for Social Media showcases and analyzes media for public knowledge and action. The center aims to help media creators, practitioners, students, and educators understand the best practices for engaging with media in their fields. Through research, resource material, film screenings, conferences, and other events, supports its mission to investigate, showcase and set standards for socially engaged media-making.

Center on Public Diplomacy

The Center on Public Diplomacy (CPD) is located in the Annenberg School of Communication at the University of Southern California (USC) in Los Angeles, California. The CPD is dedicated to advancing the study and practice of public diplomacy through the organization of programs and events that focus on teaching, training, and research development. The CPD is frequently acknowledged in international publications and was honored with the prestigious U.S. Department of State's Benjamin Franklin Award for Public Diplomacy in 2008.

The CPD was established in 2003 as a partnership between the Annenberg School for Communication and Journalism and the School of International Relations at USC. As pronounced in its mission statement, the CPD "seeks to advance and enrich the study and practice of global public diplomacy through its research and publication programs, professional training and public events." This mission is reflected in the organization's five-year strategic plan that was established in January 2011. The plan highlights the following five strategic objectives: (1) to strengthen public diplomacy scholarship, (2) to increase midcareer training programs, (3) to enhance outreach efforts to develop international networks, (4) to design an organizational structure and facility to support CPD initiatives, and (5) to expand the CPD's funding base. Increasingly, even the most basic public diplomacy skill set includes the ability to work deftly, comfortably, and strategically with social and online media, a situation that mirrors changes in the practice of "traditional diplomacy" as implemented by Hillary Clinton's social media-intensive update of State Department activities.

A diverse range of individuals including an advisory board, staff, student interns, research fellows, and contributing scholars support the operation of CPD projects. Additionally, more than 40 USC University Fellows are involved with the center from a variety of academic disciplines including communication, engineering, cinema, religion, and medicine. Professor Philip Seib served as the director of the center from 2009 to 2013. During his leadership, Seib helped strengthen the CPD's relations

with the U.S. Department of State, as well as other think tanks, institutes of higher education, and foreign ministries throughout the world. In 2013, Jay Wang, associate professor of public relations at the USC Annenberg School of Communication and Journalism, became the new CPD director.

As part of their dedication to advancing scholarship, the CPD has developed programs and publications that support public diplomacy research initiatives. For example, in 2009 a competitive international research fellows program was established. This program provides opportunities for six nonresident fellows to conduct research in their distinct areas of specialization. More specifically, each fellowship is designated for two years and provides recipients with a stipend and student assistants to support his or her given research agenda. Fellows are expected to present their research in public forums at USC, and to publish in the center's various publication outlets. In addition to the Research Fellows program, the CPD also hosts visiting scholars from around the world, which include one U.S. Public Diplomat in Residence, and a Canada-U.S. Fulbright Visiting Research Chair in Public Diplomacy. The CPD publication program supports individual and collective research through its production of the CPD blog, books and reports, book reviews, a magazine, an e-newsletter, and a monthly online

The Center on Public Diplomacy's 2008 Summer Institute in Advanced Public Diplomacy was an immersive, intensive two-week course designed to combine traditional classroom instruction with collaborative hands-on exercises.

review *PDiN Monitor*. It also publishes *CPD Perspectives on Public Diplomacy*, which is a series of papers that showcase critical thinking about the study and practice of public diplomacy.

CPD has hosted several conferences that confront significant issues and themes in international diplomacy. Its first conference, The Public Diplomacy and World Public Opinion Forum, was held in Washington, D.C., in April 2006. This event allowed practitioners, politicians, public opinion pollsters, and academics to collaborate to develop informed recommendations for improving public opinion research. Since this time, multiple conferences have been organized on the USC campus to discuss critical issues surrounding public diplomacy in international affairs and conflicts. Conference themes have addressed global events such as the peace process in Northern Ireland, American military and public diplomacy in Africa, and the 2008 Beijing Olympics. Additionally, distinct forums have been organized to address the topics of science, faith, water, and media in relation to public diplomacy. For example, in March 2013 CPD hosted a conference on international broadcasting in the social media era. This meeting allowed practitioners, policy makers, broadcasters, and social media experts to engage in panels and conversations that examined the role of transforming media venues in relation to the design and implementation of public diplomacy programs.

The CPD is also dedicated to supporting continuing education for midcareer public diplomacy professionals. Since 2005, the center has offered a Summer Institute in Public Diplomacy. This annual two-week intensive training program offers professionals opportunities to collaborate with international colleagues from various backgrounds, and to study strategies for improving their country or organization's image and impact in the world. Distinguished public diplomacy experts facilitate courses covering a range of topics including cultural diplomacy, influence and credibility, and soft power and public diplomacy. Participants also learn critical tools for advancing their effectiveness in crisis communication, digital diplomacy, international exchanges, nation branding, public opinion, and strategic communication.

The CPD also features a Master of Public Diplomacy program (MPD) that is offered in partnership with the USC College of Letters, Arts and

Sciences' School of International Relations. The MPD degree is designed to provide students with public diplomacy training for careers in public service, nongovernment organizations (NGOs), and corporate business. Students accepted to this program complete a number of required courses on historical and comparative approaches to public diplomacy, global issues and public diplomacy, and a practicum in public diplomacy research. Curricular objectives for the MPD program emphasize the role of nonstate actors, global public opinion, international news, and international communication as they relate to public diplomacy processes.

Since its inception, the CPD has become internationally recognized as a productive leader in the field of public diplomacy scholarship. With support from academic, corporate, government, and public policy circles, the CPD exists as a central organization for practitioners and leaders to collaborate and contribute to the advancement of public diplomacy research and practice.

Chaffetz, Jason

First elected to public office in 2008, Jason Chaffetz is the U.S. representative for the 3rd Congressional District of Utah. He is a conservative

Republican and has formally identified as such since 1990, the year he met Ronald Reagan. Chaffetz first served in politics in 2004 as campaign manager and later chief of staff for Jon Huntsman who became Utah's governor in 2005.

In late 2005, Chaffetz reentered the private sector to manage his corporate communications and marketing business, Maxtera Utah. From then until 2008, Chaffetz was a Utah Valley University trustee, the chairman for the Adjutant General Review Board of Utah's National Guard, and a member and later president of the Planning Commission of Highland City, Utah.

2008 Election

On January 1, 2007, Chaffetz publicly announced that he would be investigating the possibility of running for Congress in 2008. His principle Republican opponent would be Chris Cannon, a six-term veteran of Congress. He officially entered the Republican primary race on October 1, 2007, as did David Leavitt. Also on the first of October, Leavitt's campaign announced that it had already generated \$100,000 of funding for his bid for Cannon's seat, more than twice what Chaffetz had raised up to that point. Leavitt was a family legacy in local politics as the brother of Michael Leavitt; Michael was a cabinet member of the Bush administration and a three-term governor of Utah. By March 2008, a Utah poll indicated that Chaffetz enjoyed only 4 percent support in the race.

In March 2008, almost 1,200 delegates were elected in Chaffetz's 3rd District. Chaffetz announced to the delegates by mailer that his plan for his campaign was going to be radically different than the traditional money-centered variety. Instead, Chaffetz committed to running for office without a campaign office, paid staff, or polling. His goal was to spend approximately \$70 to \$80 per delegate for the campaign in its entirety. Chaffetz reasoned that a candidate's spending on the election was likely to reflect how he or she would perform in office and set out to show his fiscal conservatism as an asset.

Chaffetz promulgated a campaign based on far-right values and held more conservative positions than Cannon. Opponent David Leavitt, representing the opinion of many in his party, indicated to the press that Chaffetz had no chance to win the Republican nomination based on his lack

of resources and formal campaign infrastructure. However, Chaffetz achieved a major upset victory in the June 2008 primary, defeating Cannon with 60 percent of the vote.

Chaffetz's victory was surprising for many reasons. Cannon had the endorsements of President George W. Bush, U.S. Senators Orrin Hatch and Bob Bennett, and the vast majority of all Utah Republican officials. Furthermore, Cannon spent in approximately six times what Chaffetz did in the campaign. Chaffetz took a hard stance against requesting earmarks based on his fiscal conservatism, and this position caused some controversy during the race. In the November election, Chaffetz won 66 percent of the vote.

First Term in Office

As the 2009 congressional term began, Chaffetz announced publicly that he would not have an apartment in Washington, D.C. Instead, he would sleep in a cot in the closet of his office, and his family would remain in Utah. This was a demonstration of both his loyalty to and allegiance with Utah and his fiscal philosophy. Chaffetz argued further that he wanted to be a living example of how Congress ought to function and that his peers could and should similarly cut their budgets on behalf of their constituents. Chaffetz also began the tradition of Cotside Chats on his Web site in the style of Franklin Roosevelt's Fireside Chats.

Upon Barack Obama's receipt of the Nobel Peace Prize in 2009, Chaffetz criticized the award as meaningless.

In late 2009, Chaffetz and his fellow Congressman Jim Matheson cosponsored a bill designed to prevent the import of nuclear waste into the United States. This position was opposed by Utah's two senators, Bennett and Hatch. Also in late 2009, Chaffetz promulgated legislation restricting the use of full-body scanning technology in American airports to cases in which metal screenings indicated that more screening was necessary. Chaffetz was critical of the increase in troops sent to Afghanistan by President Obama; his criticism arose from his perception of a lack of policy and exit strategy for the Afghanistan conflict.

Latter Elections and Terms

Video footage of Chaffetz critiquing President Obama's progress and choices at a January 2010

meeting garnered extensive coverage in the media and went viral online. There is little doubt that one reason the video went viral was the social media network maintained by Chaffetz. Later in 2010, Chaffetz ran against Democrat Karen Hyer and several third-party candidates and won with 72 percent of the vote. He was endorsed by the *Salt Lake Tribune*.

In 2011, Chaffetz sponsored the ultimately unsuccessful Cut, Cap, and Balance Act of 2011, also known as HR 2560. The act would have cut discretionary spending for the fiscal year 2012 to \$31 billion below that of 2011. HR 2560 also appropriated only \$126.5 billion for war. Overall, the act was designed to reduce federal spending to 21.7 percent of the U.S. gross domestic product (GDP) by 2013 and 19.9 percent by 2021.

Chaffetz revealed a proposal for Social Security reform in late 2011. The proposal included seven elements including the calculation of yearly cost of living increases (COLAs) with the use of a chained consumer price index for workers (CPI-W). It also increased the standard age of retirement and added means testing for beneficiaries in high-income brackets. The overall purpose of the reforms proposed would be to continue growth of the Social Security program but slow that growth to avoid insolvency and excessive debt.

Chaffetz was a strong supporter of Mitt Romney during the 2012 presidential campaign and followed Romney's opponent, Newt Gingrich, during the primaries in order to voice his support.

In September 2012, the United States diplomatic mission in Benghazi, Libya, was attacked by armed intruders. Several Americans were killed in this attack. Chaffetz sat on the House Oversight and Government Reform Committee that reviewed the U.S. government's reactions to this attack and was vocal in his criticism of the White House's and State Department's management of the crisis. His committee released more than 100 pages of internal State Department documents concerned with the Libya attack to the public, which included names of Libyan activists who worked with the United States. Chaffetz maintained that the information released was not classified and therefore was eligible for release.

Chaffetz promised at the outset of his term to refuse to vote on resolutions that he calls trivial. An example would be a resolution to congratulate

a winning sports team. Chaffetz believes that such matters are not important enough to take up the time of members of the House.

Social Media Use

One of the primary strategies Chaffetz employed during his campaign was to make his social media presence strong. Chaffetz managed his social media accounts himself and used them frequently; as of December 2012, all of his Facebook posts and tweets were all composed by him personally. His use of social media made Chaffetz more appealing to a younger voting bloc, as did his appearance on *The Colbert Report* in January 2009. There, he was featured in the "Better Know a District" segment and consented to a leg-wrestling match with host Stephen Colbert, which he lost.

Upon taking office, Chaffetz attributed his success to strong principles and policies alongside determination and strategic use of social media. Chaffetz called keeping abreast of technical trends

Representative Jason Chaffetz returns his safety equipment after observing the demolition of an unsafe building in Port-au-Prince, Haiti, on March 29, 2011, after the January 2010 earthquake.

paramount and discussed his social media use, describing his success as the “worst nightmare” of Congress. According to Chaffetz, this was true because his win proved that campaigns could be successful without excessive spending, and this reality was a threat to officials running more traditional campaigns.

Chaffetz also sees attention to social media and technical trends as his means of distinguishing his work from that of his peers.

Chaffetz is very active on Twitter and Facebook and also has a YouTube channel featuring a large amount of content. His philosophy on using these social media outlets is that they allow outreach and connection to voters and the people whom he represents. Chaffetz has stated that it is important to him to ensure that his constituents can reach him directly and refuses to erect bureaucratic strata around himself.

Chaffetz chooses to post and tweet personally on Facebook and Twitter, respectively. His public rejection of outsourcing these tasks has distinguished him from most of his peers, increased his appeal to younger voters, and broadened his reach for election purposes. His use of social media also makes him abundantly accessible to constituents. Chaffetz has stated that he believes his constituents can relate to him as a person based on his social media presence.

Chaffetz argues that politicians who do not utilize social media in this way are living in the 20th century and eschewing opportunities to interact with their constituencies. He states that there is no excuse to underutilize this free form of communication for politicians.

Various social media sentiment or popularity indexes have data for Jason Chaffetz. As of December 2012, Poleet reported that Chaffetz had approximately 32,000 followers on Twitter and a Klout score of 81. According to Klout, such a score indicates a high level of influence in the social media realm and is calculated using things like number and quality of social media interactions. Some experts argue that social media did not have as much impact in the 2012 election cycle as it did in the 2008 cycle, in part because mainstream politicians learned to do things like flood the Internet with their own content at the right times so that dissenting content would be drowned and remain unheard.

One key difference in the way that Jason Chaffetz uses social media, however, is that he uses his own voice and is active himself on his pages. This is apparent to his followers and opponents alike, and it means several things. Ultimately, followers are more motivated to interact on his pages knowing that they will actually be interacting with him. Also, when his content is reposted, retweeted or otherwise shared, it is content that originates with him. Because his content is not just curated from other sources, his reach is more meaningful.

A 2012 Pew research study showed that younger groups of social media users are far more likely to use social media platforms as tools for civic engagement. These users are also somewhat more likely to identify as liberal or Democratic. This means that a politician like Jason Chaffetz has a real opportunity to fill a space that is mostly vacant: conservative politicians appealing to a younger constituency through the strategic use of social media. This is apparently an opportunity that Chaffetz plans to continue to capitalize upon.

Change.gov

Change.gov was a Web site created by the office of the president-elect, Barack Obama, "to lay out the agenda and priorities for the Obama Administration." The site was operational November 5, 2008, to January 20, 2009. Information was provided on this Web site to keep the transition process transparent. It has been repeatedly noted that President Barack Obama won the presidency because of his use of social media and social media

tools such as Facebook, Twitter, and YouTube. His use of these tools did not end after Election Day on November 4, 2008, but continued throughout the transition. Change.gov was a transitional site that was used to continue President-Elect Obama's digital presence and keep his millions of online followers engaged in the process.

The U.S. General Services Administration manages presidential transitions (the time between election day and the inauguration of the president-elect) as outlined by the Presidential Transition Act of 1963 (P.L. 88-277), 1998 (P.L. 100-398), and 2000 (P.L. 106-293). Before 2008, much of the transition occurred behind closed doors with prominent appointments to cabinet positions announced via news media—television, radio, or newspapers. Change.gov marked the first time that citizens were not only kept abreast of the transition, but also invited to become involved in the transition in an effort for government transparency. The campaign of 2008 was a campaign of firsts. The first African American president was elected. He used social media and Web 2.0 tools during the campaign to raise funds, organize grassroots communities, and mobilize an unprecedented number of young voters. He was the first president to select a chief technology officer to the cabinet, signifying plans to continue using technology in government.

Overview of the Site

The goal of social media and Web 2.0 tools is to provide a mechanism for collaboration and conversation that builds a community without limits or restrictions of location and time. Change.gov utilized this by allowing users to ask questions of the newly elected administration. Change.gov featured a Newsroom with a blog and a press room where ideas were shared and questions answered; a Learn section with information about the transition, the administration, and inauguration and biographical information about the president-elect and vice president-elect; and an Agenda section that featured major policy issues—the same issues that were presented during the campaign. To continue the encouragement of public involvement, the site also featured an area for citizens to share their Story and Vision as well as submit their ideas to the president via the Citizen's Briefing Book. It also featured links to America Serves, which asked

Americans to serve as volunteers in their communities by signing up on the site, and Jobs, where applicants could submit their personal information as a first step in applying for a position. By the end of December, only two months after the election, the site had received over 140,000 job applicants, and by Inauguration Day had received 400,000. The site provided a link to USAjobs, a government site for federal employment, which received an additional half-million visits (from 2.3 million weekly visits in summer 2008 to 2.8 million during the time Change.gov was active). Your Seat at the Table allowed citizens to see the groups meeting with the transition team. In keeping with the sharing quality that is common of most social media tools, Change.gov changed its traditional copyright notice to include a Creative Commons license that allowed users to share and repost the content.

YouTube Presidency

Another first with Change.gov was the medium used to deliver the weekly presidential address. Then-President-Elect Obama delivered the usual radio address and used YouTube and other video platforms as well to post a video of the address on the transition Web site. As of August 2012, his first address (<http://www.youtube.com/watch?v=Zd8f9Zqap6U>) on November 15, 2008, was viewed 1,082,502 times on YouTube. YouTube was also used to generate discussion and answer questions posed by citizens. Another feature of Change.gov was Join the Discussion. The policy team shared videos and requested feedback from citizens. This may have appealed to users as it had the same structure as a Facebook post with threaded comments. Another feature of the Web site was Open for Questions. Press Secretary Robert Gibbs responded to the most popular questions via a video post using YouTube and other video platforms.

Controversy and the Numbers

Open for Questions asked citizens to submit questions to the administration. The most popular questions would be answered and would be determined by the number of votes garnered. One question was if the administration would investigate the “gravest crimes” of the George W. Bush administration. Initially, it was ignored and later it was erroneously posted that the question had been previously answered. This response was featured on other

Web sites and noted by political commentators. As a result, President-Elect Obama was asked this question during an interview with George Stephanopoulos of ABC’s *This Week*. This controversy shows how social media can referee open government. The transcript of that question and the rest of the interview were posted on Change.gov.

The numbers during the transition show that interest from the public continued after the presidential election. Transitional sites such as Change.gov have been visited by 15 percent of all Americans, including 10 percent of John McCain–Sarah Palin voters. About 27 percent of Obama voters went online to either participate in the transitional process or learn more about the transition. More than 4,000 users participated in the health care discussion on Change.gov. During the first round of open questions on Change.gov’s Open for Questions, 20,000 users submitted 10,000 questions and 1,000,000 votes. The second round of open questions generated 76,031 questions from 103,512 users with 4,713,083 votes.

Conclusion

Change.gov showed that despite security and legal issues, social media can be used to promote government transparency and a more democratic form of government through citizen participation. Change.gov was a Web site used to keep citizens apprised of developments of the transition and involved in that transition. The site and its premise set a precedent that will likely continue. Because social media happens in real time, it must be noted that the transitional site of Change.gov ended at 12:01 P.M. on Inauguration Day—a minute after Obama became the presiding president. It was replaced by President Obama’s WhiteHouse.gov.

Change.org

Change.org is an online advocacy platform that encourages citizen petitioning and digital activism through grassroots campaign initiatives. Ben Rattray launched the Web site in 2007 with support from two other Stanford University students.

The initial function of the Web site provided an avenue for support of social causes or charities through online petitions and pledges. Although this idea still exists at the core function of the site, the creators of Change.org found it necessary to differentiate it from other online petitioning and pledging platforms. In 2008, the site was redesigned to focus on online petitioning through personal narratives.

The introduction of petitioning through personal narrative became a turning point in the site’s political history. Change.org founders encouraged bloggers to paint human stories for the social justice petitions they sponsored. This new form of advocacy drew increased Internet attention and raised Change.org’s position in search engine results and popular culture writ large. In 2012, Rattray made *Time* magazine’s top 100 most influential people of the year.

Several successful advocacy initiatives contributed to Change.org’s increased attention, broader social significance, and political success. In 2011, South African activist Ndumie Funda birthed a petition asking the South African government to declare “corrective rape,” the raping of lesbians as a way to “return” them to heterosexual normalcy, a hate crime. Funda’s personal story of the death of her partner, who was a victim of the crime, drew 170,000 signatures for her petition and helped influence the South African government to create a task force to review the issue.

In April 2012, the mother of Trayvon Martin, a Florida boy shot in “self-defense” by neighborhood watch volunteer George Zimmerman, created a petition requesting justice be brought to her son’s death. This petition encouraged the Florida 4th District State Attorney’s office to investigate Trayvon’s death and prosecute Zimmerman for murder. Martin’s mother also contacted mainstream U.S. media outlets, which helped fuel the coverage of the case and brought national attention to her petition. Change.org’s traffic grew from an average of 4 million visitors in December 2011 to more than 11 million hits during the time span of the Trayvon Martin case.

Once a petition like Funda’s or Martin’s gains traction, Change.org campaign directors further an issue’s reach by joining it to similar causes, distributing information about the petition via mass e-mails, and highlighting chosen issues on

the Change.org Facebook and Twitter pages. Change.org also provides tools to citizen petitioners. Online tutorials on attracting media attention, building a social media conversation, and fostering an offline social presence all help inform Change.org's petitioners learn how to use the platform as a means for broader political change.

This business model of providing activist tools and linking advocacy to personal narratives continues to allow citizens avenues for agitation against powerful state and corporate entities. In addition to Funda and Martin, Molly Katchpole successfully stopped the implementation of \$5 debit service fees from Bank of America and prompted similar actions against U.S. banking policies by her fellow citizens. Bettina Siegel intervened in the U.S. Department of Agriculture (USDA) policy on school food options by raising concerns about the "pink slime" in USDA beef. School districts may now choose beef for lunches that are slime free. Both women's petitions gained national media prominence.

For its successes, Change.org is not without controversy. Although the site's address is an .org, which connotes the nonprofit status it started under in 2007, in 2009, Change.org became a for-profit business as a Certified B Corporation. This status has brought public scrutiny with accusations that the .org phrasing of the site's name intentionally misleads users. The site's mission statement states that, although it is a for-profit business, the profits are used to help build the Change.org business and expand its reach for creating social justice.

Online advocacy tools, like Change.org, have been heralded by scholars as the future of democratic participation and simultaneously criticized as a passive invitation to social change. Skeptics fear that online petitioning tools erode civic impulses toward offline political action with slacktivist and armchair activist outlets. However, new research on political advocacy and social media suggests that online petitioning platforms are neither revolutionary paths to participatory democracy nor lazy citizenship. Instead, online petitioning, and Change.org in particular, should be viewed as necessary game adapters to activism in the new media environment. At present, Change.org provides an interactive, multimedia platform that allows ordinary

people to take their political advocacy to mass audiences. The continuing challenge for Change.org will be in figuring and refiguring how to keep citizens' voices powerfully centered in the media spotlight.

Chartered Institute of Public Relations Social Media Guidelines

The Chartered Institute of Public Relations (CIPR) is a London-based, professional organization that offers various grades of membership to all public relations practitioners in the United Kingdom (UK). With approximately 9,200 members, CIPR is led by a governing body of roughly 50 members who are directly elected by the membership. At the core, CIPR aims to enhance the reputation and understanding of the public relations profession.

The CIPR developed a social media best practice guidance document, which first debuted in February 2007. Two years later, the document was revised to incorporate changes in legislation and new developments in measurement and evaluation. In April 2011, yet another revision and update was released online to include core principles as well as best practices and legal issues to consider when developing and implementing social media campaigns.

In May 2010, CIPR launched a social media advisory panel (CIPRsm) that included 15 of the UK's foremost social media thinkers. The panel was created to develop and advance the CIPR social media best practice guide. The group was led by Rob Brown, an account executive at Staniforth, and evaluated issues pertaining to best practices in social media.

The panel did its best to remain transparent and inclusive. It established a wiki where CIPR members and supporters could view minutes from the meetings and offer input into the development of the guidelines. Members from both the panel and the CIPR general membership were encouraged to collaborate and contribute to the working document.

In April 2011, the committee and the organization published the most recent version of the social media guidelines. Although the organization has members from across the globe, the document was designed specifically to help guide those with communication campaigns that include social media in the UK.

The CIPRsm panel advised those who worked with international campaigns to consult the guidelines and legal considerations for each respective country in which target audiences would be engaged in social media. Although the document was first released in 2011, the CIPRsm panel recommended that the document be continually reviewed, updated, and further developed to keep up with the real-time changes that occur naturally in the social media sphere.

As social media platforms change and grow, maintaining a common definition of social media was important to the panel. To that end, the CIPRsm advanced its definition of social media.

Social media is the term commonly given to Internet and mobile-based channels and tools

that allow users to interact with each other and share opinions and content. As the name implies, social media involves the building of communities or networks and encouraging participation and engagement.

Integrity, competence, and confidentiality are the three core principles of the code of conduct for all members of the CIPR. Because social media is a key and growing component of public relations practice, the panel provides readers with an outline of best practices and those practices to avoid, highlighting how these core principles play into social media activity.

The list of 10 best practices include engage in conversation; ensure brand is consistent across networks and platforms; disclose relationships when endorsing an organization, client, or customer; be honest about who manages social media channels; outline the content approval process from the offset; be transparent when updating information; correct errors openly and in a timely manner; add a views-are-my-own disclaimer; be up front about conflicts of interest and paid-for opportunities; and be respectful. The panel also outlined five practices to avoid, including do not forget that a social media presence becomes part of a brand legacy; do not make an audience feel uncomfortable; do not bring a company into disrepute; do not reveal company- or client-sensitive information or intellectual property; and do not be fake.

A large portion of the guidelines outline legal issues that should be taken into consideration when incorporating social media into public relations practice. The CIPRsm panel clearly points out that the guidelines do not constitute legal advice but are instead issues to consider in an era of rapid development in British law.

The best practice guide points to the Advertising Standards Authority (ASA) Code of Practice digital remit emphasizing the importance of marketing messages online through social media. Intellectual property is also discussed within the guidelines. The law of confidence in the UK requires that a duty of confidentiality be established. This important issue cannot be overlooked when posting information to any social media channel.

The guidelines also suggest that public relations practitioners should strongly consider distributing

and using Creative Commons licensed content where possible and appropriate. Copyrights, trademarks, and design rights are also covered within the guidelines. Defamation through social media outlets is identified, and examples are provided.

With such a wide range of issues to guide an organization's social media use, the CIPRsm document discusses recommendations for employers in setting up social media policies.

The final section of the social media best practice guide places attention and focus on social media measurement. While social media measurement is important, an industry-wide standard has not yet been established. After the initial meeting of the CIPR's social media panel, it was decided that another group, known as the social media measurement group, would be established and tasked with deciding issues such as quantification of influence, engagement and conversation quality, and best practice approaches to social media campaigns evaluation. Philip Sheldrake, who is also a member of the social media panel, leads the group of nine who are developing these industry-wide standards.

With a copyright date of October 2012, CIPR released a book *Share This: The Social Media Handbook for PR Professionals*. This practical handbook, written by numerous public relations practitioners from a variety of sectors, addresses a diversity of social media tools and techniques taking place in the media and its professions by the CIPR social media panel. The 26-chapter book is split into eight topic areas that can be referenced as an easy-to-read guide for all working in the public relations industry.

Chat Rooms

Online chat rooms provide Internet users virtual meeting places that allow for conversation and interaction between people that might not otherwise be able to communicate with each other. Internet relay chat (IRC), the form of interaction in chat rooms, is conducted semisynchronously in real time, where comments posted appear almost instantly for other users to view and respond to. IRC is a much more real-time mode of computer-mediated communication than listserv messages, bulletin boards, and e-mail. Posts to IRC conversations are generally quite short, usually one or two lines, allowing the IRC interaction to be similar to multiparticipant face-to-face conversation. Chat rooms have been widely used for political discussion and are one of the early developments in social media.

The first online chat-based system, called Talkmatic, was developed in 1974 by Doug Brown and David R. Woolley on the Programmed Logic for Automated Teaching Operations (PLATO) System at the University of Illinois. The first online chat system that was available to the public was called CBSimulator, and was released by CompuServe. Since these early chat-based systems, chat rooms have emerged as one of the primary means for real-time communicative interaction on the Internet.

Chat rooms also allow Internet users to interact online in multiuser virtual environments (MUEs). There has been an increase in the use of voice over Internet protocol (VoIP) in MUEs, but the interaction within these environments has remained primarily Internet relay chat. Users are either signed in to a fully text-based online

platform or appear as avatars (visual representations of individuals in the world) in the virtual environment along with communicative fields, such as a text box, where they can post comments and track the discussion of other users. Text boxes displaying Internet relay chat have been successful tools for allowing communicative interaction as they are able to support multiple users contributing comments and are thus called chat rooms. Much like instant messaging, IRC allows users to select set usernames that appear before each comment they post, allowing multiple users to comment and maintain conversational interaction. In addition to IRC interaction being semisynchronous, it is also persistent. Because face-to-face interaction is generally ephemeral, it is very difficult to refer back to previous parts of a conversation for reference, something that is possible in chat rooms. The persistence of these interactions allows for the storage of all data as chatlogs, which can in turn be used for analyses of the users' interactions or referred back to as artifacts of past interactions. However, the nature of chatlogs as dynamic, nonthreaded interactions introduces some hurdles. It can be difficult for users to follow more than a few conversations, and there is frequently conversational leakage, where different users cross their conversations in the same chat room interaction.

Communication and information technologies present many benefits, such as the speed of information access and the ability to communicate with people regardless of geographical location, but these benefits are paired with some substantive drawbacks. One of the pitfalls of online interaction, such as conversations in chat rooms, is that the anonymity of the individuals can lead to a less-than-civil discourse (also called flaming), which does happen in political chat rooms. As a result, many chat rooms have moderators that can remove inappropriate comments or block users that violate the norms of the chat room community. An additional drawback of chat room interaction is that people are able to seek out discourse with other users that agree with their views, such as political viewpoints, and thus not be confronted with the opposing viewpoints that are often present in physical community forums. Bruce Bimber points out that this form of selective exposure can happen across the spectrum of

communication technologies, but that these same technologies also pose the opportunity to allow users to access a wide variety of viewpoints. As such, the use of chat rooms for people to engage in effective political discourse is similar to that of face-to-face interaction; people need to take responsibility for their communicative interactions and information exposure.

China

In terms of the raw number of people connected to the Web, China has the world's largest population of netizens. In 2012, it reached 513 million, namely twice the number of Internet users in the United States. Chinese citizens are increasingly connected to social media Web sites like Sina Weibo (China's Twitter), Tencent, or the Renren Network (China's Facebook), and approximately 50 percent of them have more than one social profile. By 2011, Weibo users were estimated at 249 million, while active Tencent and Renren Network members reached 711 million and 160 million, respectively. With more than 25 million

messages posted each day on Weibo, microblogging has become a crucial means of information diffusion in Chinese society. The rapid expansion of Internet use in China was accompanied by hopes in the West that online networks would facilitate demands for regime change and that the Internet would provide opportunities for the freedom of speech and political liberalization. Yet, the Internet's expansion has affected the governance of nondemocratic polities in both liberal and non-liberal ways. While new social media have created virtual communities that play a supervisory role in the political system and stimulate online and outdoor collective action, the democratic potential of these networks has also been tightly circumscribed by the Chinese government for purposes of regime survival. New information communication technologies (ICTs), including social media networks, have been used as channels for more effective censorship and thought work and as instruments for the anticipation and the prevention of disruptive social or political protests.

Social Media, the Diffusion of Opinions, and Collective Action

University students, retired officials, urban intellectuals, lawyers, the migrant population, peasants—netizens across social classes in China—now commonly use online networks as means to express their opinions and interact with other fellow citizens. In some cases, new social media have given rise to various forms of formal and informal online collective action, or what Susan L. Shirk refers to as “self-organized communities.” Netizens have hosted and supported campaign Web sites around questions pertaining to food safety, property and homeowners’ rights, gender equality, environmental protection, and labor conditions. Bulletin board systems also have facilitated the diffusion of online signature petitions around some of these matters. Campaign Web sites and petitions in turn have helped diffuse public frustrations about the government’s inability to keep up with popular demands.

Social forums have not only constituted vehicles for the expression of opinions but also have contributed to the logistical organization of outdoor collective protests. The Internet indeed helps activists bypass state-imposed obstacles to large-scale gatherings insofar as messages can be spread

After Google stated in a 2010 blog entry that it would stop censoring its Chinese search engine and operate “within the law, if at all” and may close its Chinese offices, devastated citizens brought offerings of flowers, candles, and notes to Google headquarters in Beijing. Security guards intervened, saying it was an “illegal flower tribute,” and removed all traces of the tribute.

quickly and reach out to a significantly wide audience before being censored. A report by the China Labour Bulletin found that, throughout the Nanhai Honda strike in Zhongshan, Guangdong, in 2010, workers created a chat room on Tencent to post details about the gathering, like protesters’ meeting locations. Similarly, information access on the Internet has enabled mobilizers to draw upon examples of successful protests as sources of inspiration to determine the content of their claims. Prior to their strike, workers at the Honda transmission plant saw in online news that their company had granted workers at other plants a monthly income raise of 500 yuan (or \$73). Based on these reports, they asked for a similar increase.

As outdoor mobilization unfolds, online forums constitute spaces for the interpretation of contentious events among netizens and the channeling of opinions about the legitimacy of popular claims and government response to protests. When environmental protesters in Qidong, Jiangsu, destroyed local government infrastructure and

stripped the mayor in July 2012, Weibo became the center of debates over how far protesters should go in having their claims heard and what boundaries citizens should not cross in the polity. Interpretations of contentious events usually generate significant flows of reactions. An earlier protest against a molybdenum–copper project in Shifang, Sichuan, in July 2012 triggered more than 5 million posts on Weibo within three days.

Online social media networks have pushed the Chinese government toward greater information transparency. While forums diffuse stories often neglected by China's state-run newspapers and television channels, including unwelcome speeches by foreign politicians, they also constrain the latter to break contentious daily news in a context of increasing competition among traditional and commercial media. Xinhua News Service and the *People's Daily*, traditionally at the service of China's Central Propaganda Department, now break sensitive stories about citizen protests and local government power abuses. Some cases have helped improve government awareness with respect to bad local governance and prompted Beijing to rectify corrupt practices. To that extent, greater transparency on the part of online state-run media can help contain resentment among disgruntled citizens.

Yet, that scandals and social conflicts are now being exposed nationally could constitute a double-edged sword for the government. On the one hand, more transparent news coverage facilitates the coordination of online petitions and boycotts and helps promote greater consciousness among netizens with respect to their right to information and expression. On the other hand, the online state-run media choose to break sensitive incidents at the earliest moment possible to remain the dominant voice setting the agenda and orienting public opinion against counterhegemonic rhetorics expressed in social media networks.

Containing Online Debates Through Censorship and Propaganda

The Internet is not immune to state control and regulation. Because new social media worldwide have fostered the diffusion of opinions and facilitated collective action, they have also reinforced government vigilance on the Internet in a wide range of nondemocratic countries for

regime-preservation purposes. In this context, Beijing has succeeded in developing one of the world's most-advanced Internet control regimes.

To protect its image in cyberspace, the Chinese government has relied upon Internet technology and social media users to contain online debates and orient discussions toward apolitical topics. Under the Great Firewall of China (GFW), key word filtering is built into instant messaging services and online messaging software. Terms like “Falun Gong,” “Tian'anmen Square,” and “gathering” get noticed, and warnings are sent accordingly to relevant local public security bureaus. Internet service providers hire hundreds of thousands of employees whose task is to screen and censor online conversations and blog posts. According to Freedom House, the size of the Internet police may have reached approximately 40,000 in recent years. In 2010, it was estimated that about 350 million videos, articles, and photographs had been removed by censors.

The censorship system has also been agile at targeting posts in politically contentious areas of China more proactively. A study conducted by Carnegie Mellon University revealed that, among 57 million posts on Weibo between June and September 2011, the deletion rate was higher in minority areas characterized by ethnic conflict like Tibet (53 percent) than in cities like Beijing (12 percent). Finally, the regime has recruited ordinary citizens to bolster progovernment opinions online and discredit oppositional views. They are called the 50 Cent Party (*wu mao dang*) for the amount they are remunerated per posted comment.

The authorities have also used social media to discourage and anticipate online or outdoor mobilization. Since 2010, the government has enforced mandatory real-name registration procedures requiring that all network and blog users register with their citizen identity card number. This measure has facilitated the government's ability to identify potential “troublemakers” on the Internet while also discouraging many formerly anonymous bloggers from posting politically compromising or subversive comments. Furthermore, the severe sanctions imposed upon bloggers who dare speak against the government also aim to deter other citizens from engaging in similar forms of activism. In April 2011, retired

official Fang Hong was sent to a labor camp for one year for having posted a tweet that criticized Chongqing Party Secretary Bo Xilai's crackdown on organized crime and mocked Wang Lijun, then city police chief.

Beyond the deterring effects of regulations pertaining to online identity registration and repression of popular activism, social media have helped the authorities avert collective action on the Internet and outdoors. Web site owners are commonly asked by the Public Security Bureau to shut down forums they fear could become sites of contestation. Similarly, in February 2011, the Jasmine Revolution did not materialize as the government was able to identify preemptively through online monitoring the various meeting points where protests were to take place across the country and mobilize enough police forces to stop them. In cases where the government was unable to anticipate localized resistance, it may still prevent the latter from having spillover effects in other localities. In July 2009, the Xinjiang government forcibly shut down Internet access for several months across the autonomous region to ensure violent ethnic riots between Uyghurs and Han Chinese in Urumqi would not spread to other localities. Generally, to this day, protests in China have consisted of series of isolated contentious events rather than a set of social movements.

Implications of the Internet Monitoring Regime

The state's control of the Internet has impacted the nature of citizen participation in online forums in two ways. First, a large proportion of discussions among netizens remains devoid of all political content and mostly relates to mainstream popular culture. Tweets on Weibo are generally linked to funny jokes, fashion images, and movies. As such, they tend to differ significantly from those on Twitter, where the content of discussions is often related to global events. Second, instances of online activism in China remain for the most part moderate and symbolic. Moreover, Chinese citizens assert their rights toward the market more than they question regime legitimacy.

Yet, Chinese citizens increasingly take advantage of institutional loopholes in the Internet monitoring regime to defy online government control. The Internet regulation system was designed to

remove content that openly attacks regime interests or interpretations of China's history viewed as compromising the image of the Chinese Communist Party (i.e., alternative understandings of Tibet and Xinjiang's history). As such, more subtle political criticisms by netizens may not be systematically targeted by Internet censors. Increasingly aware of the content that is likely to be removed or tolerated, Chinese netizens play on words and have developed coded language couched in metaphors to express their resentment with respect to Internet policing and government corruption. This, for instance, translates into political satires and cartoons about local government officials' laziness and police zeal, generally referred to as *egao*, or evil joking.

Regime legitimacy and the likelihood of social unrest are intimately linked to the Chinese government's ability to keep up with citizens' demands and needs. However, two obstacles are likely to arise in the process of gauging public opinion accurately. First, the hiring of netizens to post progovernment comments on blogs and social media networks makes more challenging the task of assessing how unpopular certain political decisions or policies are. Second, a significant number of public servants at various levels of the Chinese bureaucracy remain unfamiliar with Weibo and other social media applications. Being regularly updated on the latest popular concerns in different localities will require relevant departments at the central, provincial, and local levels to follow closely Weibo tweets for policy design and reform-related purposes. This in turn will require more effective coordination and information sharing among all government levels.

participation (including the virtual world) as a democratic virtue. Individuals and groups based in the United States constitute the bulk of what is known as the Christian Right movement, but similar ideological discourses may be identified elsewhere. The history, influence and evolution of the Christian Right have been predominantly researched with reference to U.S. politics.

The core of the message conveyed by the American Christian Right is analogous to the “jeremiad,” a religious prophetic genre historically employed in connection with a call for social and political engagement. There is, first of all, a reconstruction of a “golden age” when Christianity was deep-rooted in cultural and public life. The narratives vary according to each group, but most refer to the “Founding Fathers,” the American Revolution, and the U.S. Constitution as the key elements of the American “golden age.” The second feature of the message is the notion of a widespread moral and social decline that can be historically located. Some allude to the 1960s, others to earlier episodes. The central claim is that “big government” (including welfare programs), soft national defense (especially during and after the Cold War), and “cultural leftism” (secularization in particular) have undermined the prosperity and character of the nation.

Finally, there is also a call for recovery and restoration in parallel with a protest against the secularization of the political sphere. This prophetic call for the restoration of America often includes a spiritual discourse of personal conversion—being “born again”—and putting faith into practice to transform society in a “bottom-up” or grassroots fashion. There is a sense that good and evil are easily identifiable in political life and should be as clearly outlined as possible within the context of a “culture war” between right and left. There is also a top-down strategy of accessing governmental power to enact social change via “Christian” or “biblical” legislation.

A possible explanation for the recent political rise of figures associated with the Christian Right (such as Sarah Palin) is the broad alliance between evangelicals and mainstream neoconservatives. Church historians and critics point out the evangelical movement’s lack of an overarching political philosophy. Its propensity to forge alliances and adapt to other political movements

Christian Right

Students of the Christian Right have made particular reference to its impulse to expand the public sphere with new discourses and modes of

is a general trend, and the current alliance with neoconservatism represents a recent development after the Ronald Reagan era. The Christian Right, however, is theologically diverse. While most of the movement in America subscribes to various branches of evangelicalism (e.g., televangelists Jerry Falwell and Pat Robertson), groups and leaders with Roman Catholic background (such as Paul Weyrich, one of the founders of the Heritage Foundation) and traditional Protestants (such as D. James Kennedy, founder of the Coral Ridge Ministries and Center for Reclaiming America for Christ) should not be overlooked.

Themes

Millennialism is a recurring element in the political theology of the movement and arguably a crucial way of differentiating its subgroups and inner tensions. The Christian Right's jeremiad is often combined with a perception of eschatological urgency embedded in some variation of premillennial theology, the belief that Jesus Christ will return after a great tribulation and persecution of the church to establish a millennium of prosperity and peace. The dispensational variety of this view of history adds a prominent political role for Israel in the eschatological era—a belief that strongly influences the foreign policy agenda of most of the Christian Right. Francis Schaeffer, author of a *Christian Manifesto* in the 1980s defending a cultural strategy for contemporary Christians, was a nondispensational premillennialist influence on the movement. Tim LaHaye (American Coalition for Traditional Values), popular writer and pastor, is a key intellectual in the dispensationalist group.

A postmillennial minority believes that the tribulation refers to the early church. The optimistic task for Christian politics today is to establish a Christian millennium of prosperity and peace via conversions and widespread application of a biblical worldview to social, political, scientific, and cultural life. While the outline of a jeremiad narrative also applies to this latter group, there is a deliberate attempt to differentiate its theology and view of history from the majority view of evangelicalism and the Christian Right. Members of the Christian Reconstruction movement, such as the late Calvinist theologian R. J. Rushdoony (founder of the Chalcedon Foundation), are often associated with this view.

Social Media

Eschatology informs organizations of the Christian Right in their engagement with social media. The American Values group, led by Gary Bauer, has three categories of news on its main Web site: “pro-life,” “traditional marriage,” and “pro-Israel.” The Christian Worldview Network's page includes a “worldview times” section, including headlines applying Bible prophecy to current events. Bridges for Peace, a group with many offices worldwide, hosts online a number of radio talks and videos about Israel. “We invite you to join us in a practical expression of this desire to bless Israel,” says Chief Executive Officer (CEO) Rebecca Brimmer on its Web site, “by . . . fulfilling biblical prophecy through the vital and important work of Bridges for Peace.” Sometimes, however, there is also an attempt to justify the pro-Israel stance with secular arguments that speak to a broader neoconservative audience. One of the key campaigns of the Christian Coalition of America is called “Stand with Israel.” In a YouTube interview with Senator Lindsey Graham, the coalition invites readers to join it, explaining the policy in terms of democratic peace and freedom of worship in the Middle East.

Postmillennial groups also shape their social media strategy under the influence of their eschatological narrative, often voicing disagreement with Israel-centered interpretations of prophecy. Moreover, the millennium of peace and prosperity requires a biblical strategy putting faith in action. Economic historian Gary North, one of the pioneers of the Christian Reconstruction movement, has written a multivolume verse-by-verse “Economic Commentary on the Bible” and made it fully available for free online. He also wrote a “Biblical Blueprints” series that was republished online. Rushdoony's Chalcedon Foundation currently offers an extensive audio and video library, as well as a number of digital educational resources on applied Christianity under the “Research” section. American Vision, led by Gary DeMar, is a “Christian Worldview Ministry” particularly proud of its social media engagement, defining itself as an “Internet leader for disseminating information and distributing educational resources that build a comprehensive Biblical worldview, motivating Christians to engage and reclaim our culture for Christ.” Its

call for bottom-up action and “Reconstructionist” theology is reflected in the motto “Exercising Servanthood Dominion” and the key project, “Restoring America One County at a Time.” The project’s blog classifies local news according to each topic on the policy agenda and geographical location.

International Groups

The label Christian Right has also been applied to religious-political groups outside the United States. In countries with a balanced multiparty structure, the movement has attained a clearer political expression. In Canada, for example, Stephen Harper, a member of the Alliance Church and leader of the Conservative Party, became the prime minister in 2006. The direct influence of Christian Right figures such as evangelical lobbyist Charles McVety (Canada Family Action) in the Harper administration is debatable. However, the complex historical formation of the Conservative Party can be traced back to Christian right-wing politicians (e.g., Preston Manning) and organizations (such as the Reform movement). While a number of groups with an active and significant presence in social media draw upon the U.S. agenda and cognate organizations (such as Focus on the Family Canada), the differences should not be neglected. For one thing, the Canadian Christian Right has strong historical links with the Social Credit movement and tends to qualify its views on capitalism, unlike its U.S. counterpart.

Another relevant case is that of the Netherlands, where religious groups and political activism are institutionally correlated in newspapers, political parties, and nonprofits. A key group representing the Christian Right in this case is the Reformed Political Party (SGP), assisted by the Guido de Brès Foundation (a policy research institute) and the *Reformatorisch Dagblad* daily newspaper. The group of Calvinistic churches supporting the movement in the Netherlands is very suspicious of indiscriminate use of television, but the Internet engagement of these organizations (including Twitter and Web sites) seems to operate at a professional level. In the United Kingdom, the direct influence via political parties (such as the Scottish Christian Party) is practically negligible, with much of the effort being concentrated

on institutes and lobby organizations. The non-denominational evangelical Christian Institute, led by Colin Hart, has a strong journalism department and campaigns mixing social media in various formats, newsletters, and print publications. Christian Concern maintains another relevant media program, with an emphasis on Christianity in legal and political life.

The Dutch and British cases differ from the United States in terms of setting. An acute concern with secularization is a central theme, perhaps because the presence of national churches in both countries leads to additional political friction with both mainstream conservatives and the so-called cultural left. European supranational politics is another factor that differentiates these two cases from the American context.

Mainstream Neoconservatism, Education, and Alternative Views

The recent literature on the Christian Right debates the extent to which the movement has been reinforced, or even partly co-opted by mainstream neoconservatism, particularly in the United States. This would at least in part account for a widespread perception of the movement’s influence in the political process, especially in key issue-areas where both ideologies greatly overlap, such as foreign policy, education, and family-related policy. Media consumption often reflects this overlap, especially in terms of television and radio. The use of the #tcot (after the Top Conservatives on the Twitter Web site) hashtag is another indicator of the overlap between mainstream neoconservatism and the Christian Right.

There are, of course, groups and organizations that distance themselves from secular manifestations of conservatism and the mainstream media. This procedure may accompany a discourse of mistrust and counterhegemony, often visible in the social media. Some interpret this move in light of the Christian Right’s concern for reshaping education in a way that better reflects its worldview and historical narrative. This effort predates the Internet and remains parallel to it, requiring no aggressive social media presence, as it seems to have already branded itself to its constituency (e.g., Liberty and Bob Jones Universities). A newer genre, exemplified by virtual homeschooling curricula and other distance courses, appears

in a number of platforms, especially digital video and Webinars. These are frequently offered not by the higher education institutions, but by non-profits associated with the Christian Right. A key concern, in continuity with the jeremiad narrative readapted for the movement by figures like David Barton and Peter Marshall, is historical revisionism portraying America's national identity as that of a "Christian nation."

Critics have ascribed the Christian Right's suspicion of widely accepted views on history and natural science to anti-intellectualism. However, the movement's interest in public intellectuals, educational institutions, and nonprofits, as well as the grassroots development of a social media presence focused on the production and dissemination of alternative knowledge, begs for a more nuanced reading of the phenomenon. Communication theorists have attempted to reinterpret it in light of the postmodern condition of epistemological suspicion. Empirical research on popular mistrust of mainstream accounts of climate change, public health, and creationism has suggested the notion of "I-pistemology," or "the self as origin of all truth," as a plausible way of framing social media activity on a more individual basis. Although individual experience and judgment are emphasized in the intensification of the use of these new platforms, the traditional roles of science, democracy, and institutionalized knowledge are not fundamentally questioned. The use of social media is employed rather as a "corrective" way of presenting an alternative story while at the same time avoiding the gatekeeping practices of the traditional platforms.

Conclusion

Overall, the Christian Right's engagement with the social media is relatively modest at the grassroots level, with the bulk of the effort being concentrated at the top organizations able to raise funds for national campaigns. Working together, though, both grassroots and well-articulated groups have shown great effectiveness in isolated cases. In 2013, the social media campaign to call the public's attention to the abortion-related Kermit Gosnell case attained considerable success in terms of awareness and mobilization. Another instance is the rise of Tea Party activism in recent years. The relevance of the social

media presence of the Christian Right in similar isolated cases is hard to measure, but it should not be neglected.

Citizen Journalism

The proliferation of communication technologies and new media has transformed contemporary journalism by harnessing the power of audiences and citizens to participate in news reporting and dissemination, leading to the rise of citizen journalism. Citizen journalism reverses the traditional relationship between audience as consumer and reporters as producers of news. J. Rosen's

definition of this type of journalism captures such reversal: “When the people formerly known as the audience employ the press tools they have in their possession to inform one another, that’s citizen journalism.” The new concept strives to democratize news practices by putting community interests ahead of corporate interests with an undiluted emphasis on audience participation. This entry focuses on two fundamental implications of citizen journalism: first, how citizen journalism transforms the traditional news production, consumption, and dissemination processes; and second, how these tools foster more participatory and democratic political and media cultures.

Citizen journalism has subverted the traditional journalistic paradigm in which news is exclusively produced by professional journalists and massively disseminated by organizations to reach audiences who are less likely to be involved in the earlier processes. New media offer several ways to transcend this rigid model of news production, dissemination, and consumption. Steve Outing of The Poynter Institute suggests 11 layers in which news organizations can wield the power of the Internet to embrace citizen journalism practices. These 11 layers range from innovations that are easy to implement, such as “opening up to public comments,” to the most radical innovations, such as “wiki journalism: where the readers are editors.” Mainstream news organizations have already used the Web to encourage public comments sections in which readers “react to, criticize, praise or add to what’s published by professional journalists.” Wiki journalism moves beyond simple user comments to permit anyone to compose, post, or edit any news story that has been posted on the Web site. The goal is to produce well-crafted, balanced, and credible news coverage via harnessing the power of crowdsourcing and mobilizing smart mobs to utilize group effort and intelligence in the news production and consumption processes. The blending of these processes has fostered produsage, a hybrid form of journalism that entails simultaneous production and usage.

With the proliferation of new social media tools, like blogs, citizens challenge the gatekeeping and agenda-setting powers of mainstream media. As a form of citizen media, blogging erases traditional barriers associated with news gathering and publishing. Any citizen with access to a computer

can become an instant reporter on his or her community without the overseeing control of editors and publishers. Bloggers have had a palpable influence on mainstream media, as can be gleaned from the resignation of CBS’s news anchor, Dan Rather, in 2004 after bloggers proved that the documents CBS relied on to claim that George W. Bush evaded military service were in fact forgeries. Among other blogs, Freerepublic.com and the DrudgeReport.com publicized the forgeries in the CBS investigation, forcing other mainstream media to cover the issue and eventually leading to CBS’s humble apology. In politics, the Senate Majority Leader Trent Lott resigned in 2007 after his controversial comments praising the efforts of segregationist Strom Thurmond. Lott’s comments became political and media fodder largely due to the work of bloggers from TalkingPointsMemo.com and Instapundit.com. Spurning the gatekeeping role of editors, the new citizen reporters and bloggers have become gatewatchers who filter mainstream news by highlighting, promoting, and debating issues central to their communities.

The participatory emphasis underlying the citizen journalism model is based on a vision of an inclusive public sphere in which audiences become active political agents and the democratic process becomes more representative of diverse views in society. The inclusive vision in which marginalized political voices are aired and heard is central to South Korea’s OhmyNews, which remains one of the best known, if not the first, organized effort to consciously set up a citizen journalism outfit. C. H. Bentley describes OhmyNews’ founder, Oh Yeon-ho, as a “new Martin Luther in this Digital Reformation” for his bold vision of a modern journalism in which “every citizen is a reporter.” The OhmyNews citizen journalism model relies on an army of thousands of citizen reporters who write news stories that are edited by a few professional journalists in what might be termed as a professional–amateur (pro–am) collaboration. Evidence of the potency of such pro–am collaboration was witnessed in the coverage of important events including the southeast Asia tsunami in 2004 and the London terrorist bombing in 2005.

While the above examples demonstrate citizen journalism’s ability to challenge corporate mainstream media’s narratives, social media have sharpened citizen reporters’ tools and exponentially

augmented the scale of user-generated content. As violent confrontations between police and street demonstrators followed the contested 2009 elections in Iran, Iranian citizens flooded Facebook, Twitter, and YouTube with dramatic footage and video evidence that highlighted the regime's heavy-handed tactics. The breathtaking speed at which dissidents' stories were updated and the accompanying social media attention ensured that the opposition's narrative drove the news agenda worldwide. A YouTube executive, N. Newman, asserted their site's role as a vital citizen reporting platform by claiming that "Iranian citizens are having their voices heard, their faces seen and their story gets told around the world without filtering." In sum, citizen reporters have transformed journalism from a lecture-like communication practice into a participatory, critical, and discursive conversation.

Civil Rights

In American English, the term *civil rights* refers to individual rights defined within the Bill of Rights, several amendments to the U.S. Constitution (Thirteenth, Fourteenth, Fifteenth, and Nineteenth), and election rights within the Voting Rights Act. Within civil law systems, the very same rights are described with the term *civic rights* (*Burgerrechte*, *droits civiques*), which refers to rights granted by states exclusively to their citizens, shaping the mutual relationship between the individual and the state. In the United States, those rights may also be described with the term *civil liberties*. The most important civil rights include voting rights, right to labor, right to education,

Hospital staff participate in computer and Internet skills training at the Juba Teaching Hospital Health Information Resource Center in Juba, Sudan, in 2009. The right to Internet access may be recognized as a civil right in some legal systems even though it is not an element of the universal human rights law.

and right to diplomatic protection. Concurrently, states are obliged under numerous international law treaties to grant human rights, including civil and political rights, to individuals in their jurisdictions. In this context, the term *civil rights* covers a certain category of human rights as referred to in the 1966 International Covenant on Civil and Political Rights (ICCPR). In civil law systems, those rights are described with the notion of civil rights (*bürgerliche Rechte*, *droits civils*). Next to civil rights, political and economic rights may be identified as separate but complementary groups. Jointly, they form the universal catalog of human rights. Social media strongly influences the perception of civil rights, urging the need for their uniform application.

According to author Robert G. McCloskey, the subject of civil rights is the liberties of a person as a person and not primarily as an economic animal. In American English, civil rights are rarely referred to as civic rights, although they reflect the idea of civic rights (*Bürgerrechte*, *droits civiques*) in civil law countries. This is a category consisting

primarily of individual liberties guaranteed by a state to its citizens within acts of national law. While human rights are recognized globally, based on a system of international treaties, civil rights are guaranteed by national constitutions and other acts of national laws. Unlike human rights, which are thought of as originating from the innate dignity of the human person, civil rights are considered legal rights and therefore granted to an individual by a state. Civil rights so perceived cover the right to free speech and religion in the shape defined by national acts of law, the right to vote, the right to education, or the right to obtain diplomatic protection from state authorities while abroad. Civil rights are only generally mentioned in international law treaties as they primarily originate from national laws.

For example, they are briefly mentioned in the Charter of Fundamental Rights of the European Union (EU). Since 2009, the charter is perceived as part of law of the EU as per the Lisbon Treaty, in which a direct reference thereto was made. It defines particular political, social, and economic rights of EU citizens that are to be considered by EU bodies when drafting and exercising acts of EU law. Chapter V of the charter, devoted entirely to citizens' rights, includes every EU citizen's right to vote and to stand as a candidate at elections to the European Parliament as well as at municipal elections. It also grants every person within the jurisdiction of EU states the right to good administration, that is, for their affairs to be handled impartially, fairly, and within a reasonable time by the institutions and bodies of the EU. Furthermore civic rights in the EU include each individual's right to have the community make good for any damage caused by its institutions or by its servants in the performance of their duties. Every EU citizen holds the right of access to documents of the European Parliament, Council, and Commission and to refer to the Ombudsman of the Union cases of maladministration in the activities of the EU institutions or bodies. Active participation in social and political affairs may also be exercised through the right to petition. Freedom of movement and of residence as well as the right to diplomatic and consular protection in the territory of a third country is granted to every citizen of the EU.

The catalog of civil rights guaranteed by national constitutions to a large extent repeats

certain globally recognized human rights, emphasizing their recognition in national legislation and detailing their execution. The interrelation between civil rights and human rights is very close. Although civil rights originate from national acts of law, in large part they reflect human rights named in international treaties. For example, the right to life, considered a basic human right, is granted by numerous human rights treaties and repeated in acts of national laws, first and foremost in constitutions.

The International Covenant on Civil and Political Rights

Although states are obliged to respect and protect human life in general, their particular obligations toward individuals originate from acts of national law. Similarly, the human rights law system endows citizens with a right to participation in political life, as enshrined within Article 25 ICCPR; however, details of the execution of that right and limits of its application are defined in national acts of law.

There are also those rights that are granted solely by national laws, while their international status as human rights has not yet been confirmed.

The right to Internet access may serve as a good example of depicting the practical difference between civil rights as an element of the human rights system and civil rights covering only rights recognized by an individual state. While some states, like Brazil or Norway, recognize the right to Internet access within their national acts of law, the global debate on the existence of the human right to Internet access as an emanation of the right to access information continues. Therefore, the right to Internet access may be recognized as a civil right in some national legal systems, while it is not an element of the universal human rights law.

The term *civic rights* can also be used to describe a category of human rights included in the ICCPR, an international treaty fundamental to existing human rights law next to economic, social, and cultural rights defined in the International Covenant on Economic, Social and Cultural Rights acknowledged by the United Nations (UN) on December 16, 1966.

In this context, civil rights are a category of human rights law, constituting an international

obligation of states toward any and all individuals within their jurisdictions.

Among the civil rights named in the ICCPR, numerous basic human rights have been identified. The rights to physical integrity, including the right to life, freedom from torture, and cruel, inhuman, or degrading punishment as well as a general prohibition of slavery are named in Articles 6, 7, and 8 of the covenant. The inherent right to life is granted in Article 6 to each individual and requires states to take active measures to grant that right effective legal protection. It is considered a supreme right, which suffers no derogations and is to be understood broadly. Among civil rights, the right to individual liberty and security of person also are named. Following the common law habeas corpus doctrine, Article 9 of the ICCPR prohibits arbitrary arrest and detention. Any deprivation of liberty may only be conveyed as an exception to that rule and based on a provision of law in accordance with procedural minimal standards, provided for in Articles 9 and 10 of the ICCPR.

Individual liberty is often interpreted as not only the freedom to convey certain action within the limits set by law protecting the rights and freedoms of others but also as freedom from any intrusions. It constitutes an obligation of any third party, that is, state authorities and private individuals alike, to refrain from imposing any limitations upon individual freedom unless such intrusions have been provided for by law.

Among civil rights, the ICCPR includes a principle of procedural fairness and the protection of the rights of the accused in its Articles 14 and 15. Those rights include the right to a fair trial, presumption of innocence, and the right of an appeal to a court of higher instance. It also includes the principle *lex retro non agit*, disallowing any criminal proceeding to be initiated upon an act of law that was not in force at the time when the act subject to responsibility was being committed.

Among civil rights, individual liberties such as the freedom of movement, religion, thought, speech, assembly, and association are named in Articles 12 through 22 of the ICCPR. It grants each individual the right of privacy, including protection against unlawful attacks to individual honor and reputation. The following articles of

the ICCPR mandate individuals with the right to marry and every child with the right to acquire a nationality.

Article 19 of the ICCPR grants each individual the freedom of speech fundamental to all social media. The individual right to freedom of opinion and expression is composed of three complementary rights: freedom to hold opinions and the liberty to receive information and to impart it, regardless of frontiers. Confines for exercising these complementary rights are defined in Article 29, paragraph 2, which subjects their implementation to such limitations as are determined by law and introduced for the purpose of securing due recognition and respect for the rights and freedoms of others. Restrictions may also be set up in order to meet the just requirements of morality, public order, and the general welfare in a democratic society.

The imminent trait of the human rights system is that it is based on a fundamental rule of non-discrimination. Therefore, human rights named in the ICCPR are to be applied to every human being. Only Article 25 of the ICCPR, granting the right to participation in political activities, restricts its application to citizens of state parties, obliging them to grant to every citizen the right and the opportunity to take part in the conduct of public affairs, directly or through freely chosen representatives, to vote and to be elected, and to have access to the public service in his or her country. ICCPR introduces a system of international protection of rights granted therein. The UN Human Rights Committee was established to monitor the introduction and execution of those rights within national legal systems. It is a treaty-based, high-level group of experts who examine state reports by ICCPR parties. Although the committee is entitled to settle disputes between state parties, its quasi-judicial character remains disputed, just as its actual effect on the introduction of effective civil rights protection mechanisms. Its political character causes criticism for representing nondemocratic states and reluctance to refer to numerous long-lasting human rights violations.

Changes Brought by Social Media

Social media brought a dramatic change to the way civil rights are perceived and exercised. The

transboundary character of the network changed the way communities arise and operate. Particularly young people engage in online communications more willingly and frequently than they participate in real-life local elections or other forms of participatory democracy, which allows exercise of civil rights offline. This globalization of the perception of civil rights resulted in the need for unification of standards provided in national laws for universal civil rights enshrined in the human rights system. People gathering in online communities wish to be granted equal protection of the right guaranteed to them by international law treaties.

A good example of that challenge is posed by the right to assembly. It is recognized as a civil right granted to individuals by states of their citizenship or residence according to Article 25 of the ICCPR. Thanks to the impact of social media, this civil right gained a new dimension with the outburst of the Arab Spring in late 2010, originating from and strongly shaped by virtual assemblies. Groups of individuals were exercising their right to public gathering online, discussing crucial political issues on social platforms while communicating and planning real-life gatherings in cyberspace. The right to assembly transformed into the right to virtual assembly. Also, the 2012 Occupy Wall Street movement contributed to raising the awareness of social media's impact on exercising civil rights while channeling social disapproval for the economic crisis and aiming at protecting social and economic rights.

Another example of a civil right significant in social media and subject to different interpretations by national authorities is the right to privacy, enshrined in Article 17 of the ICCPR. Privacy may not be subject to arbitrary or unlawful interference. This prohibition is perceived differently by individual national authorities. While in Europe the right to privacy is recognized as a human right with state authorities obliged not only to refrain from interference with individual privacy but also to actively prevent any interruption thereof by third parties, in the United States the right to privacy is not enshrined in any federal act of law and often recognized as the effect of free market powers.

Hans Shattle argues that the contemporary sense of community and group identity may serve as the basis for civil rights development, although

those groups currently are primarily shaped by technology and social media. According to Hans Shattle, the notions of allegiance, belonging, and loyalty are shared nowadays regardless of historically established communities guarded by laws across national and political jurisdictions, while advocacy networks function based on shared goals and principles. Citizenship has given place to a shared cause, uniting individuals within online communities and requiring a uniform application of globally recognized civil rights.

Clickable Calls to Action

A call to action, by definition, urges a reader, listener, viewer, or respondent to react and take immediate action upon hearing a message. In the digital era, calls to action have been leveraged on Web sites to allow viewers to instantly, with the click of a button, respond to a message. The button may be a graphic or text that is created to capture the viewer's attention. The goal of the clickable call to action is to retain the viewer and urge them down a conversation funnel, which is a term used to track consumers and their page views and clicks. Ultimately, it provides a focus to a Web site, a way to measure a site's success, and a direction for a site's users.

While for marketing strategies the goal may be to drive sales, in the political arena the goal is often to generate votes or donations and galvanize support for a cause. Many consider an ad or Web site without a clickable call to action a failure or a missed opportunity because the viewer is no longer engaged. It is considered a best practice for those in political office or nonprofits to create emotionally hard-hitting videos or content that is wrapped up in a button to compel the viewer to take action.

Best Practices

There are measurable ways to create a successful call to action campaign. A site should have a small number of distinct actions but not too many so as to overwhelm or lose the interest of the viewer. It is important, as well, to use active and urgent language to coerce the viewer to take action. Some buzzwords include donate, subscribe, register, buy, and call. Placing a deadline on a call to action or suggesting that supplies are limited creates a sense of urgency. The visuals of a clickable button are equally as important in retaining a viewer's attention. This includes where the button is placed on the Web site and the colors, fonts, shapes, text, and visual effects of the button.

Not all calls to action are hosted on a party's Web site. Many calls to action are hosted on a platform that can redirect traffic back to a site. For instance, YouTube's Clickable Call to Action now allows users to drive traffic from their videos to external uniform resource locators (URLs) of their choice with a semitransparent ad that appears over the video.

Google offers a wide range of applications for nonprofit organizations to promote their causes. Google for Nonprofits offers a wide array of products and applications that are either discounted or free for nonprofit organizations. It allows nonprofits to not only broaden their constituent bases but also to use applications to save time and money while connecting with other nonprofits to learn about their best practices. Using these tools to publicize a campaign or cause is crucial to drive traffic to the call to action button.

Clickable Successes

In the 2008 presidential election, President Barack Obama became one of first politicians to

effectively use social media to spread awareness for his campaign for office and galvanize voters. His methods were no different than candidates of years past, such as John F. Kennedy, who utilized television. In Kennedy's case, however, the call to action was less immediate as it was asking for a vote on Election Day or a check to support his campaign. Through social media, President Obama was able to drive voters to his Web site, www.barackobama.com, where they could immediately see a clickable call to action button with the words, "Quick Donate \$5." The verbiage on the button indicated that a donation of just \$5 was significant and the action would not take much of their time. Once clicking on the button and continuing down the conversation funnel, the Web site's host could not only track additional information on the viewers but ideally encourage them to donate more money. Many calls to action offer incentives. At one point, President Obama's campaign page offered a free T-shirt to those who donated \$30 or more.

President Obama carried his social media strategies from 2008 into his 2012 campaign, when he was re-elected after a strong presence on YouTube, Twitter, Facebook, and other social media outlets.

In 2012, a video, "Kony2012," created by Invisible Children, Inc., went viral on YouTube. The video was released on March 5, 2012, and portrayed a Ugandan militia leader indicted on war crimes, Joseph Kony, who was arrested before the end of 2012. The film had more than 94 million views on YouTube by October 2012. At the end of the video, a stop clock ran out of time and text appeared telling the viewer that the time had come to take action. It laid out three ways in which viewers could help the cause: Sign the pledge to support the cause, purchase the bracelet and action kit, and sign up to donate a few dollars per month. The film then directed viewers to Kony2012.com and the Invisible Children Web site, where clickable calls to action were abundant in asking for pledges and offering merchandise. The film was so successful that it resulted in a resolution by the U.S. Senate and contributed to the decision to send troops by the African Union.

Other recent compelling campaigns that have led to greater awareness include videos from

Feeding America, Amnesty International, Habitat for Humanity, and Water.org.

Click-Through Rate

A click-through rate (CTR) is defined as a ratio of clicks received divided by the number of impressions of an online ad or link. Both ads and links appearing on social media can be rated for effectiveness by CTR. Usually, it is expressed as a percentage. For instance, if a link is displayed 1,000 times and results in 12 clicks, the CTR is 1.2 percent. CTR is used as a measure of the effectiveness of both online ad placement as well as content link placements. It is somewhat analogous to a response rate in traditional advertising, although generally traditional advertising response rates require a more concerted effort from the respondent. In recent elections, CTR has taken on new importance as calls for social action and campaign

donations can be linked to highly effective CTR for online advertising spending and social media campaigns.

Factors Impacting Click-Through Rate

There are a variety of factors that can impact the CTR of a placement. Effective targeting, so that the viewer of the content is most likely to be interested in the target subject, is perhaps the largest predictor of ultimate CTR. For example, an ad for a political candidate is likely to have a higher CTR on a Web site with content about that candidate's political party than on a Web site focused on linguistics. Similarly, the channel used for display can impact the CTR. An ad for a candidate that is displayed in a search channel, when a user has specifically searched for "how to contribute to a political campaign" versus an ad displayed on a general election news Web site is likely to have a higher CTR as searches have been shown to have higher CTR overall for similarly themed content. Platforms also have been shown to have different levels of CTR, with mobile platforms having a higher CTR than desktop computers.

Content and design elements have also been linked to CTR. Research has shown that incentives, emotional appeals, interactivity, color, animation, and placement position all have an impact on ultimate CTR. These content and design elements have also been shown to have differing impacts for consumer-focused versus business-focused ads. Personal referral mechanisms, where a user is sent a link by a friend, have also been found to be directly linked to increased CTR. Another factor impacting CTR rates is click fraud. Click fraud is defined as clicks that are generated by fraudulent means. With the widespread accessibility of revenue from online advertising, click fraud has become a large factor, constantly being battled by large advertising clearinghouses such as Google, Bing, and Facebook.

Impact of Click-Through Rates on Advertising Costs and Revenue

CTR can influence the cost for online advertisers and the revenue for online publishers who accept ad or link placements. Online advertisers generally have three methods of paying a publisher for the display of an ad or link. The most basic, cost per impression (CPM), charges a fixed rate per

1,000 displays. A high expected CTR can directly increase the CPM as the advertiser expects a higher average number of clicks per display. CPM can also be high even with a low CTR when the advertiser's goal is branding to the target demographic of the publisher's users. The more direct cost per click (CPC) method charges a fixed rate per click. Here, the CTR most directly impacts the likelihood that a publisher will continue to choose to display an ad or link. If the CTR is too low, then the publisher is likely to prefer a higher CTR unit so that they can generate more advertising revenue. However, both the CPM and CPC methods provide no guaranteed direct linkage to revenue for the advertiser and are subjected to reduction in value with the spread of click fraud. The last method of cost per action (CPA) was created as a reaction by advertisers to less-than-expected value per click. In this method, the advertiser pays a fixed rate per action generated by a click from the publisher's content. The most common action is a completed sale. CPA is analogous to a commission in a more traditional sales setting. This method serves as a regulator of the quality of a click and reduces the direct importance of CTR as a measure of effectiveness. In CPA relationships, CTR is used as a diagnostic tool to identify potential barriers between a click and ultimate action.

Clicktivism

Also known as slacktivism, clicktivism is a portmanteau, or combination of terms describing activism that is conducted via the Internet. Critics complain that online activism is inadequate and may even harm the social and political causes people are attempting to support by conferring a false sense of accomplishment that forestalls more effective engagement. Despite clicktivism's negative connotations, in particular the perception that Internet-based activism is lazy and ineffective, in the 2000s, social media increasingly became a valued site for political organization. Social media networks like Twitter, YouTube, and Facebook in particular are key sites for recruitment and messaging for a variety of organizations from political campaigns to activist groups.

In the United States, Internet-based boycotts of companies that have been accused of supporting discriminatory media content have resulted in advertisers discontinuing their sponsorship of several popular, formerly desirable radio and television programs, including the *Glenn Beck* show.

In one of the most high-profile examples of online activism, during the 2012 American presidential campaign influential conservative talk show host Rush Limbaugh drew rapid and widespread criticism for his comments characterizing Georgetown law student Sandra Fluke as a "slut" and a "prostitute" in response to her congressional testimony in support of health care coverage for contraception.

Clicktivism has also enabled international causes to spread quickly across national borders as with "Kony 2012," a viral video that was seen by tens of millions of viewers worldwide and helped raise awareness of efforts to arrest Lord's Resistance Army leader Joseph Kony for war

crimes involving children in his native Uganda and other African countries.

Outcomes

The Rush Limbaugh–Sandra Fluke incident was a particularly conspicuous example of successful online activism. When Limbaugh labeled Sandra Fluke a "slut" and "prostitute" on his talk show, he triggered a backlash that outstripped prior controversies. Though he is no stranger to dispute (by most analyses, his popularity relies upon it), the swiftness and strength of the response came as a surprise in this case. News of the incident spread quickly through feminist social media networks and resulted in at least 12 advertisers and two radio stations withdrawing their support from the Rush Limbaugh show despite its status as the most listened-to talk show in the United States.

In another indication of the influence of this activism, the confrontation between old media and citizen-fueled social media also brought about a very rare apology from the venerable and usually fearless broadcaster. This outcome differs conspicuously from other Limbaugh-related disputes, which have often ended in even the most powerful critics apologizing to him.

Clinton, Hillary

Hillary Rodham Clinton has engaged in several major national roles in her life, including 67th U.S. secretary of state (2009–13), U.S. senator (D-NY, 2001–09), First Lady (1993–2001), and 2008 presidential candidate. Although she employed social media (including announcing her run) during the campaign, the Barack Obama campaign's innovative use of the Internet for fundraising and audience targeting overshadowed her efforts. She is being touted as a leading potential candidate for the 2016 presidential race, with the "Ready for Hillary PAC" (launched in February 2013) reaching over 50,000 Facebook fans and having over 100,000 e-mails in its database in two months, 43 months before the November 2016 election. In a life known for extensive public service and inventiveness in her use of power, Clinton's mark on diplomacy will perhaps be best remembered by her extensive use and promotion of social networking technology, combined by record-setting travel.

A 1969 Wellesley College graduate, Hillary Clinton served as senior class president and was active in student politics; she graduated in 1973 from Yale Law School, where she met future husband Bill Clinton. She served on the presidential impeachment inquiry staff, advising the House Judiciary Committee during the Watergate affair; following that, she became a faculty member at the University of Arkansas Law School. She married Bill Clinton on October 11, 1975, and in 1978, he was elected Arkansas governor, with Hillary Clinton serving as First Lady (1979–81 and 1983–92). Clinton also served as the First Lady of the United States from 1993 to 2001,

during her husband Bill Clinton's time in the White House.

President Barack Obama nominated Hillary Clinton for secretary of state (the third woman and sole former First Lady to serve in this position), and she was confirmed on January 21, 2009. Her term was marked by strong advocacy for human rights, especially for women and children. She was one of the most-traveled secretaries of state, reported by the U.S. State Department as having logged 956,733 miles over 379 days on the road, visiting 110 countries. Although diplomacy typically has been considered a "boots-on-the-ground" position, Clinton recognized that the human connections could be enhanced and advanced via social media.

Social Media

As secretary of state, one of Clinton's most notable initiatives was to greatly enhance the use of social media and other new technologies as a means of fostering dialogue between people worldwide, as well as a way to increase foreign policy initiatives. This occurred both within the Department of State as well as with international partners intent on expanding Internet freedom. Clinton encouraged ambassadors to expand their Twitter and Facebook presences in order to increase responsiveness and to help catalyze participation. The State Department now boasts its own Twitter feed in 11 languages, 192 other Twitter feeds, and 288 Facebook accounts, and diplomats in the foreign service institute must be trained in the uses of social media. As secretary of state, Clinton had almost 13 million Facebook fans, 2 million Twitter followers, and 16 million video views with around 27,000 subscribers. These innovations have significantly impacted foreign policy and reimagined power relationships; in the past diplomats would have used overnight flash messages, and now news spreads through multiple connection technologies.

Clinton's 21st-Century Statecraft initiative involved the use of social media tools to achieve foreign policy goals. She tripled funding for computer training and surveillance-evading software for dissidents. Clinton first learned of the 2010 uprisings now known as Arab Spring from Twitter. Her perspective is that employing technology will enhance U.S. advocacy for the disenfranchised.

Examples include using text messages to raise money for the Haitian earthquake survivors and sending a delegation of women technology leaders to Africa to discuss how social media can serve as a platform for people in underdeveloped countries. She also established divisions within the State Department to answer violent anti American extremism on the Internet with rapid response Twitter or video feeds. With her 21st-Century Statecraft platform, Clinton has championed technology as means to engage people in a less traditional diplomatic way, while enhancing the State Department's engagement with publics and issues worldwide.

This revolutionizing turn to the diplomatic use of technology has been articulated in a number of addresses. In remarks at the Barnard College commencement on May 18, 2009, Clinton reminded graduates that the social networking tools such as Twitter or Facebook that they commonly use can be employed to fight human trafficking or child marriage, decry unfair treatment of journalists, or call for group actions. Social media were tools for democratizing diplomacy, and she announced the formation of the Virtual Student Foreign

Service, designed to facilitate diplomatic engagement through social media. E-interns assist various agencies to conduct digital diplomacy, such as developing public relations campaigns using social media sites, creating means of gathering and analyzing media coverage of issues, researching information technology-based interventions, writing articles for the various State Department Facebook pages on issues, and surveying social media efforts by nongovernmental organizations (NGOs), diplomatic posts, and others.

On January 21, 2010, in remarks on Internet freedom at the Washington, D.C., Newseum, Clinton gave what was termed a historic speech on Internet policy and global online freedom. Clinton described the spread of information networks as creating a new nervous system for the planet, but she cautioned about the threats to online freedom through government censorship and other virtual walls. In a follow-up speech at George Washington University on February 15, 2011, Clinton reminded the audience that the Internet is now the world's town square, classroom, and marketplace, where people shape and are shaped by what happens there. She called on people worldwide to

Secretary of State Hillary Rodham Clinton delivered a speech titled "Internet Rights and Wrongs: Choices and Challenges in a Networked World" at George Washington University in Washington, D.C., on February 15, 2011. Clinton called the Internet "the 'public space' of the future—a vital, global town square in which everyone shares an equal interest."

protect the freedoms of expression, association, and assembly in the online context, calling these three freedoms “the freedom to connect.” These digital rights provide people a platform to present ideas and innovation, as well as establish connections and the possibility for economic growth. At a conference on Internet Freedom at the Hague on December 8, 2011, on the eve of Human Rights Day, Clinton spoke of creating an international digital defenders partnership to combat restrictions on human rights on the Internet.

Clinton has repeatedly described 21st-Century Statecraft as the use of Internet tools to achieve foreign policy goals, advocating for Internet freedom through a number of programs, initiatives, grants, and forums. Among those were State Department stands taken on behalf of online activists and journalists who have been imprisoned; international forums on Internet freedom and governance tied into human rights issues; establishing the Office of the Coordinator for Cyber Issues; and supporting U.S. Agency for International Development (USAID) executing a program to establish digital safety capacity-building to local media and organizations around the world. Secretary Clinton’s 21st-Century Statecraft initiatives connected private and civic sectors with foreign policy by joining resources and partners together for innovative diplomatic work via new technologies.

One example is the GSMA mWomen Program, described as a public-private partnership led by the Global Women’s Initiative that aims to close the global mobile phone adoption gender gap. Civil Society 2.0 joins the technical capacity of civil society organizations with tech-savvy groups and individuals to help raise digital literacy, enhance NGO communication networks, and amplify the impact of civil society movements. There have also been several Tech@State conferences on topics ranging from using technology during disasters to developing apps for specific needs, such as mobile money.

As secretary of state, Clinton engaged in a number of “Global Town Halls,” which employed social media and IP video conferencing technology. Her last such chat occurred on February 4, 2013, at the Newseum in Washington, D.C., where she answered questions from college students worldwide. Secretary Clinton took questions through voiceover Internet protocol (VoIP)

technology, e-mail, Facebook, Twitter, and Sina Weibo (the Chinese Twitter). She noted that technology has become a big part of diplomacy, which was demonstrated through her ability to speak to students in six countries.

Conclusion

Hillary Clinton embraced social media as a way to conduct foreign policy in an interdependent world that demands and expects greater interconnectedness. She is a champion of technological innovations and initiatives, and she aggressively developed the State Department’s use of technology to add dimension to its policies and agendas. As a result of her efforts, American diplomacy that typically had been a formal process of staid interactions between trained actors has been enlarged to include the public. This coincides with Clinton’s public service history of focusing on engaging people to engender change, especially for the under-represented.

Cloud Computing

Cloud computing is a term that describes the use of a network of remote servers to perform functions that were traditionally run from localized computers. Rather than using one's own computing hardware and software to run programs, store information, or develop content, these files and services are held elsewhere and accessed via the Internet from massive off-site data servers. Cloud computing services are often accessed via personal computers or, increasingly, through the use of mobile phones and tablets with either a dedicated software platform or a Web-based user interface.

The primary advantage in operating within a cloud infrastructure is that it is often desirable to outsource data management, software licensing, and server ownership and maintenance to other third-party firms that operate on an economy of scale and expertise rather than perform all tasks in-house. Individual users and consumers who use cloud-based software or storage often are drawn to the ease, reliability, and stability of these "anywhere, anytime" services and the platforms with which they are provided.

However, cloud computing requires that the user have a great deal of trust in the remote

management system as the cloud-based entity maintains hold of a great deal of potentially private or personally sensitive information. Furthermore, cloud-based servers must have strong encryption and security protections and procedures in order to protect such content. As such, the legal and ethical use of client data (particularly across international borders) has drawn increased attention from political and privacy advocates, alike. This would be especially important in situations involving personal and potentially sensitive information, such as medical records, legal documents, and political preferences, actions, and affiliations.

Examples of cloud computing include Apple's iCloud storage services, Google's cloud platform (including Docs, Calendar, Spreadsheets, and Drive storage system), or DropBox, as well as Amazon's Web Service, Microsoft's SkyDrive, and IBM's PrivateCloud, or EMC's Atmos.

The term *cloud computing* is a metaphor referencing the abstract and amorphous nature of a decentralized computer network that mirrors the network structure of the Internet, only on a smaller scale. With the rise of computer networks, broadband Internet access, and in particular the mobility turn of the 2000s with the rise of the mobile data grid, it was realized that it could be advantageous to users to access their content or services on their devices while storing their content or software elsewhere. This was true not only in terms of bypassing the finite limitations of hard drive storage but also by providing services to mobile clients that could not otherwise be possible with a relatively static, centrally localized network. The concept of the cloud would be embraced as a forward-looking technology by many citizens and digital firms alike, as land broadband and mobile data speeds continued to increase data transmission speed.

Privacy Issues and Security Concerns

Perhaps the most troubling concept of the cloud is the privacy of users' stored content and communication. Privacy advocates have argued that most end-user license agreements (EULAs) effectively allow cloud service providers to access one's content at any time for any reason, a clearly troubling notion to those who argue for digital privacy protections. There have also been several cases where

cloud-based storage has been hacked by outside individuals, either on an individual scale or en masse, and users' personal data, stored content, and communication have been compromised. Despite strong encryption and security practices, cloud-based systems are under constant attack from hackers or other parties that wish to access private and sometimes sensitive information.

Even more troubling to privacy advocates is government surveillance of cloud-based communication and content. Under the USA PATRIOT Act, government agencies can monitor users' online communication and content by requesting access to user data, which in most cases does not require a warrant.

Cloud-based file storage services have also come under fire as distributors of intellectual property through nonlegal means because virtual file storage can also serve as a distribution network for music, video, software, or other commonly shared material. Most notably, this was the case that led to the 2012 shutdown of MegaUpload.com by the U.S. Department of Justice for distributing illegal content, which resulted in the seizure of all user data contained in the company's 25-petabyte server matrix.

The cloud appears to be the future of computing. As mobile networks increase in both speed and coverage, and as more electronic devices appear that can share similar files (such as documents, music, video, and such), a network-based storage that is accessible anywhere will appeal to consumers, and corporations will increasingly use this strategy for many of the same reasons. The biggest threat to the future of cloud computing appears to be the security and privacy question, along with the ability to roll out faster infrastructure to appease data-hungry consumers.

Cloud Computing and Citizen Privacy

Cloud computing is a technology of the information technology (IT) sector that became publicly available in the first decade of the 21st century. Cloud computing is the current innovation of the global IT sector and is swiftly developing into the service offering of choice in business as well as government. In general, cloud computing offers three types of services: software as a service (SaaS), infrastructure as a service (IaaS), and platform as a service (PaaS). SaaS is a software delivery model with its data centrally located and accessed by clients with a web browser. IaaS is associated with computer hardware or infrastructure with service that is associated with a platform virtualization environment; and finally, PaaS deploys software applications to support the systems and cycles of Web applications available online.

All of these service models are promoted or deployed with public clouds, hybrid clouds, private clouds, and community clouds. Even Facebook can be considered a cloud computing service. Although users may appear to "own" their personal Facebook page, the site, along with its unique hardware and software, is owned by Facebook. There are significant concerns regarding cloud service providers (CSP) in the area of privacy and security, however. Moreover, given the efficacy issues regarding cloud as more public sector entities rely on these services it is important to briefly review the evolution of cloud computing, its economic impact, and its challenges in government and voter privacy.

In addition to scalability and reliability in government and privacy, the need for securing data in the cloud is a paramount concern. For example, the 2.0 phase of social media and the Internet has

created an incredible urgency related to information, collaboration, and creativity; however, the issue of security conflicts and its attendant vulnerabilities remains a barrier. Currently many security experts believe that the cloud model creates an opportunity for illegal activity in relation to hackers, identity theft, and/or creative production. Therefore this leads to a widely held perception that SaaS applications and cloud computing services are less trustworthy than locally controlled networks within an organization.

Drawbacks

The security drawback for cloud computing is the issue of having to share files with a third party. Because it can be accessed from any personal computer with Internet connection, viruses can infect the data files. Another issue is control over saved data if security is not up to standards of IT governance and files lost cannot be retrieved.

Growth and Future Trends

Cloud computing will continue to contribute not only to business innovation in regard to e-commerce but also within the education field in relation to management and the passing and sharing of knowledge. For example, individuals that use Google Docs to send data and receive messages are already performing an aspect of cloud computing. However, security concerns may lead to a move to some type of centralized data control institution whereby a legal authority can engage in identity management.

Cloud Protesting

Social media and mobile technology have changed the way people organize, mobilize, and protest. Organizing has become easier and quicker, and protest tends to be fluid, temporary, and elusive. Organizational patterns have transformed, with individuals and networked collective action becoming prominent at the expense of traditional movement organizations. The narrative of the action is no longer centralized and controlled by social movement organizations, but any activist can contribute by producing, selecting, and diffusing material like tweets, pictures, and videos.

Cloud protesting indicates a type of social organizing for collective action that has individuals (and their needs, identities, and bodies) at its core. Cloud protesting is fostered by social media platforms and mobile devices. The notion was developed by S. Milan as a theoretical concept to illustrate how social media politics change organized collective action. Examples of cloud protesting include the worldwide Occupy Wall Street mobilizations and Anonymous, a digital activism network.

Cloud computing is the delivery over the Internet of customized services such as software. Services are stored "in the cloud," where users can access them on demand. The sharing of products and infrastructure result in cost reductions for the end users. Applying the computing metaphor to collective action, the cloud takes on two meanings. On the one hand, the cloud is an imagined digital space, where participants store, share, and enjoy soft resources crucial to collective action, such as collective identities and narratives. On the other hand, the cloud is a metaphor for a specific way of connecting individuals in an instance

of collective action, which appears to be heavily influenced by the modes of interaction typical of social media.

In times of social media, the cloud, made of blogs, social networking, microblogging, and digital storytelling platforms, is the main place where conversations and exchanges about politically oriented collective action take place. This digital space is to be intended in the guise of a symbolic place between mobile devices and social media platforms, similarly to B. Sterling's definition of cyberspace as the "place between the phones" where a telephone conversation appears to occur. A set of vital ingredients enabling mobilization coexists in the cloud: identities, meanings, slogans, protest practices, and expertise. They emerge and are negotiated both in online and offline settings but are brought to life, exchanged, and stored in the cloud. At the same time, the cloud is a metaphor for social media-specific ways of creating meaningful connections among individuals and speaks to the individualization observed in contemporary collective action.

From the Organization to the Cloud

One can distinguish three main types of groupings that have supported politically motivated collective action in the West from the 1960s onward: the social movement organization (1960s–1990s), the network (1990s–mid-2000s), and the cloud (from mid-2000s onward). In the first phase, identity- or issue-based organizations such as student, church, antiwar, or women's groups provided leadership, managing crucial resources like funding and monopolizing the cultural and normative production of the movement. In the 1990s, informal networks and affinity groups took central stage, also thanks to the horizontal and participatory possibilities offered by the Internet. These informal networks, which coexisted with traditional organizations, embodied multiple and flexible identities and horizontal leadership. The movement's cultural and normative production was no longer monopolized by large-scale organizations, but the different nodes would voice their claims and build their narratives in a number of Web sites and online, self-organized platforms.

The new wave of protest that spread across the world in 2010 and 2011 inaugurated the phase of cloud protesting characterized by networked

individuals rather than traditional organizations. The Arab Spring brought thousands of people to the streets in north Africa; the Spanish movement of the Indignados (literally, the outraged) and antiausterity protests like the worldwide Occupy spurred a new wave of mobilization; fluid networks like Anonymous mobilized online. Contrary to earlier mobilizations, activists privileged a way of converging that focused on, and highly valued, individual needs, preferences, and contributions. The private and subjective experience of individuals became central to the collective dimension because participants shared via social media not the actual action but the experience of the action, filtered through their own perspectives.

The prominence of individual over group engagement influences the way activists experience collective identity, that is to say the process through which people give meaning to their experiences and develop emotional attachment to their fellows, according to F. Polletta and J. Jasper. Typically, when the action is the expression of a group of people acting together, the group gives meaning to the individual. In cloud protesting, on the contrary, taking action is the sum of individual, and not group, performances. Rather than a unifying group narrative, the resulting collective identity is the sum of the shared meanings that have survived the exercise of pooling together individual experiences.

Tailoring Participation to Collective Action

Social media and mobile devices influence collective action in four ways. First, social media enables an unprecedented speed in protest organization and diffusion. Second, social media have the ability to broaden participation because rallies and sit-ins unfold on these same platforms as much as they take place in real life—even if one might question the quality and perseverance of such participation. Third, social media influence the tactics adopted by activists in what might be called the politics of visibility. Action becomes functional to its visibility, and in turn, the visibility afforded by social media becomes the measure of the success of a movement's tactics. Fourth, and most important, social media enable the creation of a customizable narrative and a tailored collective identity that virtually fit all. On the one hand,

through social media protesters actively participate in the first person to building a collective identity, and on the other, social media give voice and visibility to personalized yet universal narratives, whereby everyone participates in building the collective plot.

The cloud gives a presence and a multifaceted shape to immaterial resources like identities and narratives in an array of digital objects, such as tweets, links, photographs, and videos, which render those meanings tangible. Rather than being managed and imposed by social movement organizations, resources are in the cloud to be enjoyed by participants in a pick-and-choose fashion. By taking part in the protests and making them visible via microblogging platforms, each participant defines him- or herself, and by extension the mobilization, by means of posts, pictures, and short videos. He or she selects other similar material posted on the Web by fellow coprotesters and passes on (e.g., retweets) what he or she believes is exciting and appropriate to the collective representation of “who we are.”

In addition, anyone can easily identify with the network of individuals engaged in the protests as the collective identity is built on minimum common denominators and ephemeral slogans rather than ideological strongholds. The personalized yet universal narratives of the protest emerge thanks to social media originating a hashtag-style collective narrative. Such a narrative is flexible, real time, and crowd controlled. It connects individual stories into a broader context that gives them meaning. In turn, it scores very low in organizational control. In other words, the cloud leaves little room for classical social movement organizations: the loose collective actor identified by the cloud becomes the group, providing a slack sense of belonging and virtually no responsibility over fellow activists.

Like in cloud computing, the cloud reduces the costs of mobilization for collective actors by offering resources that can be accessed via social media and enjoyed independently by individual activists. Not only does cloud protesting represent a new type of social mobilization that has brought individuals and their individualized media to the forefront of dissent, in a fashion that concretizes the notion of the Internet and its contiguous technologies moving beyond their original functionality

as communication devices and into an independent “social presence”; it also is an indication of a new awareness for the role of digital technology not just as a tool for networking and organizing, but as the backbone of a movement’s cultural and normative production.

Cloud Tiger Media

Cloud Tiger Media, Inc., owns and operates Upworthy, a viral aggregator that delivers curated daily picks via Pinterest, Facebook, Twitter, and e-mail newsletters. With the financial backing of Chris Hughes, the cofounder of Facebook, Cloud Tiger Media was founded on March 26, 2012, by Peter Koechley, the former managing editor of the online satirical news site *The Onion*, and Eli Pariser, president of online campaign network MoveOn. Eli Pariser is now Upworthy’s chief

executive officer. The aim of the news aggregation site, Upworthy, is to spread progressive content virally through the Internet.

Upworthy describes itself as mission-driven. Curators sift through the clutter of videos, blogs, and pictures available online, and highlight content that will make citizens more aware of larger social issues. According to its mission statement, the company's goal is not to appear unbiased, but rather to bring attention to progressive social issues. It describes itself as pro-gay marriage, and antichild poverty.

Upworthy works with causes to build traffic and to connect them to an audience, in return for a referral fee. While Upworthy's content curators do create some stories, most of their time is spent searching through visual sites such as YouTube. Unlike traditional news outlets, which emphasize timely current events, Upworthy focuses on content that is of high interest to its audience. Upworthy focuses on online content that is visual and sharable. Reposting or sharing Upworthy content allows audience members to shape and define their own public identity. At the same time, reposting and sharing Upworthy content connects new audiences with the organization's progressive content.

Upworthy describes its audience as the "*Daily Show* generation." As such, the curators spend much of their time curating a clickable headline that is humorous, tongue-in-cheek, and sarcastic. When Upworthy's curators find content, they come up with a list of headlines. They then use a platform, SimpleReach, which tracks every social action around Upworthy's content and correlates those actions with site engagement. With the help of SimpleReach, Upworthy can discover which headline is most effective in generating clicks. For example, in October 2012, Upworthy published a map of gay rights around the world with the headline "Hey Look, It's a Map of Inequality!" One of Upworthy's most-viewed videos in 2012 was of a local Wisconsin news anchor defending her weight to an online bully. Another was an ad from an Australian organization defending gay marriage titled "If This Video Makes You Uncomfortable, Then You Make Me Uncomfortable."

Once a user clicks on a headline, he or she is directed to Upworthy.com. The header on the page, "Things that matter. Pass 'em on," reflects Upworthy's progressive mission. It also positions

itself as having an informal, friendly relationship with the user. Once users click on the content they wish to view, the site further invites users to identify with the organization's progressive stance. Before users can view any content, they are met with a window that states "I support equality for all. I believe everyone should be treated equally, regardless of race, gender, or sexual orientation." The user is given the opportunity to either click "I agree" or "I disagree." If the users click "I disagree," they go directly to the content. If the users click "I agree," they are met with another window that again states, "I support equality for all." In addition, this window solicits users to enter their e-mail with "We've got tons of great content that we think you'll love. Check out our daily email, The Upworthiest, and find out!" After submitting an e-mail address, the user clicks a button that states, "I'm in!" At this point the user also can close out of the window to access the content.

At the time of writing, Upworthy does not display advertising. While mission-driven, Upworthy is a business, and as a business it makes money by creating leads and traffic to nonprofits. Upworthy acknowledges in its Web page, "About Us," that it often faces moral decisions about who to work with. While it promises to work only with organizations that are creating positive social change, it also states that Upworthy almost never completely agrees with everything a group does. For example, while Upworthy would support, and agree that a religious group that provides food for low-income people is positive, it may disagree with that group's stance on gay marriage.

As traditional media outlets, such as newspapers and radio, are becoming less effective in raising awareness of public-interest stories, those companies that focus on the distribution of social media, such as Upworthy, are becoming more effective.

One year after its inception, Upworthy became the fastest-growing media company in the world, growing from zero to 10.4 million readers. According to Facebook metrics, Upworthy had approximately 1.2 million followers, and about 65 percent of the U.S. population has a friend who likes Upworthy in the spring of 2013.

CNN Effect

The term *CNN effect* arose after the Cable News Network's (CNN) saturation coverage of several key events during the tail end of the Cold War era—especially the 1989 Tiananmen Square Massacre and the collapse of communism in Europe—which were followed in the 1990s by similar 24-hour coverage of the Gulf War and crises in Somalia. Whereas traditionally Americans would have had to wait for the evening news or the publication of a daily newspaper the following day, the CNN effect allowed them to remain up-to-date every minute of the day with immediate coverage.

As a result of the real-time reporting, some observers started to believe that decisions related to foreign policy in the United States were being made in response to what CNN was reporting. Historically, the media had always had some influence on decision making in the United States, but what citizens were witnessing appeared to be a different phenomenon. The CNN effect was faster and deeper than what had previously been observed. The American public was seemingly receiving information at the same speed as decision makers in Washington, D.C. While the term was originally

inspired by CNN, it has since been applied to many forms of modern media and networks.

Given the prevalence of the CNN effect, it is not surprising that academics have taken to studying the actual impact of its emergence. Steven Livingston wrote the seminal paper on the topic, "Clarifying the CNN Effect." Livingston's central argument is that the media functions in one of three ways: agenda setting, impeding, or accelerating. In the agenda-setting role, the media helps tell people what policies to pay attention to. With impeding, they move toward raising efforts to block a policy moving toward acceptance. And with accelerating, the media helps push an issue through the policy process in an expedited manner. Constant coverage on a particular piece of news may lead to political attention being paid to it, and sometimes forces the matter, requiring politicians to address issues because of the resulting public interest.

Whether this is good for government depends on whether one is a citizen or a politician. For politicians, the CNN effect is troublesome because there is less time for reflection, analysis, and intelligence gathering. While transparency increases, accuracy may in fact decrease in the initial stages. For example, on September 11, 2001, CNN initially reported that a small Cessna plane had accidentally collided with the World Trade Center before more information became available. Decisions must be made much more quickly with the presence of constant news.

If speed truly is the key to determining whether the CNN effect is valid, then recent trends in social media suggest that it is transforming into a more generalized social media effect. While CNN was able to bring the public information quickly in the mid-1990s, Twitter, Facebook, and other social media sites have quickly become the go-to place for immediate news coverage. Recent political events have borne this out. During the raid on Osama bin Laden's hideout in May 2011, an unknowing Pakistani was live-tweeting the American attack based on the noises he was hearing from his apartment. Likewise, if the Arab Spring had occurred in 1995, CNN would have been able to provide timely updates, but it would not have been able to present the quantity of detailed information that individuals experiencing the protests firsthand were able to share. And without those firsthand accounts, some

CNN staffers prepare for a CNN/YouTube Republican presidential debate in November 2007. During the debates, candidates faced some of the thousands of voter questions sent in via YouTube.

could question how responsive outside forces would have been. The actions of countries like China, North Korea, and Pakistan, with their varying degrees of government-enforced censorship of the Internet and social media, shows an acknowledgment of the potential power of social media in enacting change. It was easy to monitor state-controlled media, but with the emergence of social media, it has become more difficult to censor what the world learns about a particular situation.

The most recent example of the new CNN effect occurred with the Boston Marathon bombings in April 2013. While television news networks and traditional media were quick to make information available to the general public, social media sites were exploding with frequent updates, questions, pictures, and video. As would be expected, law enforcement officials at all levels have begun monitoring such sites to attempt to garner any relevant clues regarding cause or motive. While social media did not directly lead to the capture of anyone involved, there was a healthy, public deliberation occurring and ultimately a platform through which Americans could rally around one another in the wake of the attacks.

All of the above is not to say that the CNN effect is a net positive. At a minimum, it is known that the CNN Effect has changed from being merely about alleged claims of media dictating

foreign policy decisions in the United States. There is a cost associated when citizen journalists are able to take to a large audience at no cost, and instantaneously. For politicians, strategic planning and the days of collecting all available information prior to being asked to make a statement are gone. If a public official responds by telling a reporter that he or she is still collecting information or is unsure of making any comments at the time, social media will likely explode with claims of incompetence or ineffectiveness. In the age of immediate information, Americans have largely come to expect immediate, accurate answers and that can prove to be as problematic as it is helpful.

Coattail Effect

The coattail effect describes the ability of popular political candidates to attract electoral support for other candidates of the same party. Much of the discussion of coattail effects examines the tendency of presidential candidates to help their party's down-ballot contestants (i.e., congressional candidates) earn electoral victory. For this reason, the

coattail effect is sometimes studied as part of the larger body of research on presidential–congressional voting. Still, the notion of coattail effects is just as applicable to other levels of government.

For instance, a popular gubernatorial candidate may influence the outcome of state legislative races in favor of his or her own party. At any level of government, an exceptionally popular candidate who helps a considerable number of candidates from his or her party achieve election may be said to have very long coattails. For instance, U.S. presidential candidate Ronald Reagan is often credited with helping Republican candidates for Senate unseat 12 incumbent Democrats during the 1980 election season. The ability to generate a strong coattail effect is generally regarded as a political achievement for a presidential candidate, in part because it helps ensure support for a president's legislative agenda. However, the idea of coattail riding may have negative connotations when it implies that a down-ballot candidate did not earn victory on his or her own merits. In addition to being the subject of scholarly inquiry, the concept of electoral coattails is also a topic of discussion among journalists and political analysts in news media.

Identifying the Coattail Effect

The simplest measure for identifying the presence or absence of a coattail effect is to compare the number of votes earned by a presidential candidate to the number of votes earned by his or her party's congressional candidates in the same year. A presidential candidate who earns more votes than the rest of his or her party is said to have helped his or her party by way of the coattail effect, whereas a presidential candidate who earns fewer votes than his or her congressional counterparts is regarded as having failed to cultivate a coattail effect. Importantly, the work of numerous political scientists, most notably Warren E. Miller of the University of Michigan, has produced much more nuanced equations for accurately calculating coattail effects. In fact, it has been proposed that a presidential candidate who substantially outperforms congressional candidates of his or her own party has apparently low pulling power and, therefore, little or no coattail effect. Ultimately, because of the multitude of variables that influence the outcome of presidential and congressional elections, the coattail effect is difficult to identify with scientific precision.

Several factors other than a high-profile candidate's popularity could influence the likelihood of apparent coattail effects. Specifically, party identification, attitudes toward specific presidential candidates, and a host of forces unique to each individual, lower-level election may determine if and when citizens' congressional voting decisions are influenced by their presidential voting decisions. Incumbency is another important variable in the coattail effect phenomenon. Traditionally, the effects of a presidential candidate's endorsement of lower-level candidates have been regarded as an issue altogether separate from coattail effects. So, while coattail effects and endorsement effects are sometimes examined together, true coattail effects do not depend on a party's congressional candidate having been directly endorsed by that party's presidential candidate.

The coattail effect is more likely to occur in years that feature a presidential election. This is because presidential candidates are among the most well-known leaders of political parties and because presidential elections attract more voters to the polls than midterm elections. The physical layout or appearance of a ballot can influence coattail effects as well. In the early days of political parties, coattail effects were particularly common because all of a political party's candidates were listed in a single column—sometimes on a single piece of paper. Thus, it was easy and common for voters to cast a straight-party ticket rather than cast a split-ticket vote. In fact, the coattail effect was once so strong that it was entirely common for U.S. presidents to begin their terms with majorities in both houses of Congress.

The presence of strong third-party candidates for president can also complicate the nature of the coattail effect. In such elections, it is not unusual for a party's down-ballot candidates to receive more votes than that party's presidential candidate. The 1948 U.S. presidential election between Harry Truman (Democratic), Thomas Dewey (Republican), Strom Thurmond (States' Rights Democratic), and Henry Wallace (Progressive) is a prominent example of this occurrence. Regardless of whether a third-party presidential candidate is involved, a presidential election year in which a party's congressional candidates garner more votes than their presidential candidate is sometimes noted for exhibiting a reverse

coattail effect. The notion of a negative coattail effect refers to the tendency of unpopular presidential candidates to negatively influence the electoral fortunes of other members of the same party. For instance, U.S. presidential candidate Barry Goldwater is sometimes said to have been such a weak Republican candidate for president in 1964 that many voters were discouraged from voting for Republican candidates farther down the ballot.

In Singapore, the advent of Group Representation Constituencies has encouraged a form of coattail effects in the election of members of parliament. The system requires candidates to run as part of three- to six-person slates, each of which is required to include a member of a minority community. The most popular candidate on each of these slates is often credited with helping lesser-known candidates on the same slate get elected. New Zealand's mixed-member proportional electoral system, which sometimes encourages major party representatives to endorse members of minor parties, may also increase the likelihood of some form of coattail voting.

Coburn, Tom

Tom Coburn is currently a Republican U.S. senator from Oklahoma. Before serving in the Senate, he served three terms in the U.S. House of

Representatives. Coburn is considered one of the staunchest conservatives (both economic and social) in the Senate. He is probably best known for his criticism of government waste and pork barrel spending. He is such a critic of government programs and spending that he is frequently referred to as "Dr. No." Despite his conservative reputation, Coburn has sought to work across party lines on tax and debt issues—most notably as part of the "Gang of Six." His conservative stances on abortion, taxes, and spending reflect the views of the majority of his voting constituents.

Thomas Allen Coburn was born in Casper, Wyoming, in 1948. He attended the University of Oklahoma, where he received his undergraduate degree, and Oklahoma State University, where he received his medical degree. For much of his career, Coburn was a doctor.

In 1994, Coburn was elected to the U.S. House of Representatives from Oklahoma. Like many other Republican challengers, he endorsed Newt Gingrich's Contract with America—a series of popular conservative proposals that Gingrich promised to bring to the House floor for a vote if Republicans gained control of the House of Representatives. Once elected to the House, Coburn supported the Contract with America, including a balanced budget amendment, welfare reform, tax cuts, and term limits. However, Coburn soon became disillusioned with Gingrich, feeling that he was selling out conservative principles that he had promised to promote in the Contract with America. Gingrich was too moderate for the conservative Coburn. Coburn was easily re-elected in 1996 and 1998. Coburn declined to run for re-election in 2000, keeping a campaign promise not to run for more than three terms.

In 2004, Coburn was elected to the Senate seat vacated by the retiring U.S. senator from Oklahoma, Don Nickles. In the Senate, he became known for his fierce opposition to government waste and spending—even if it displeased his fellow Republicans. For example, Coburn offended his fellow Republican Senator Ted Stevens of Alaska when he opposed the Bridge to Nowhere. Throughout his Senate career, he sought to ban earmarks as well as make public which senators requested them. On social issues, Coburn opposed abortion in all instances as well as gay marriage. He was easily re-elected in 2010.

Despite his reputation as a conservative, Coburn forged friendships across party lines, most notably with the young freshman senator from Illinois, Barack Obama. The unlikely duo sponsored legislation cracking down on government waste. Despite their vast philosophical differences, the men remain friends to this day.

In recent times, Coburn has worked across party lines with the “Gang of Six” to solve debt and tax issues. For example, in 2011 he worked with the “Gang of Six” to forge a compromise that would lead to Congress raising the debt ceiling (though their compromise was not adopted).

More recently, Coburn signaled that he would support raising some taxes in order to avert the so-called fiscal cliff. This stance ran contrary to his party, which insisted that it would not raise rates (though it would consider closing rates in order to raise revenue). While Coburn primarily wants to cut spending, he considers it unrealistic to rule out raising taxes. Coburn has also disagreed with his party on defense spending. While supporting a strong national defense, Coburn is more willing to cut defense spending—especially in areas where he perceives waste and fraud. According to the publication *National Journal*, Coburn on average votes with Republicans in Congress 85 percent of the time.

Coburn is perceived as a principled conservative and man of integrity. Even his critics grudgingly respect his adherence to principle. However, his reputation as a man of integrity was challenged as a result of the fallout over Nevada Republican Senator John Ensign’s extramarital affair. Ensign resigned from office after it was revealed that he sought to keep the affair quiet by offering bribes. An investigation revealed that Coburn knew about Ensign’s affair and was aware of negotiations to silence Ensign’s mistress’s family through bribes. In 2011, the Senate Ethics Committee reprimanded Coburn for his conduct in the matter.

Coburn serves on a number of high profile committees including Finance, Judiciary, and Homeland Security and Government Affairs. Undoubtedly, Coburn will play a major role in negotiations over taxes and the debt for years to come.

CODEPINK

CODEPINK is a self-described women’s movement for peace. Formed in 2002, CODEPINK focuses on challenging U.S.-led and funded military action across the globe. Its goal is to encourage the reallocation of resources spent for militarism to the funding of humanitarian issues, such as education, health care, and the environment. The organization is of special interest to a study of social media and politics because of its use of digital platforms to develop, organize, and mobilize its membership, leading to widespread recognition of its actions within the political public sphere.

Background

CODEPINK’s membership includes a decentralized collection of mostly U.S.-based chapters, with

international chapters in Canada, Germany, and Japan. While the group accepts male members, the membership is primarily composed of women.

The group entered the public sphere on November 17, 2002, when founders Media Benjamin, Jodie Evans, Diane Wilson, and Starhawk began a four-month vigil at the White House in protest of military action in Iraq. With approximately 100 other women, CODEPINK maintained an all-day presence outside the gates of the White House lawn to bring attention to its call for peace.

The name of the organization rearticulates the terrorist color-coded system, developed by the George W. Bush administration in the wake of the September 11 terrorist attacks on the United States. In this system, Code Red signifies the top level of alert for a terrorist crisis. Alternatively, CODEPINK signifies the highest level of alert for a humanitarian crisis. Furthermore, the color pink connects with the traditional gendered identity marker of femininity, thus connecting with the group's identity as a women's movement. The group's discourse is characterized by themes associated with liberal feminism, invoking assumptions about the "innate" nature of women as more caring and nurturing.

The group generated national attention by staging protests such as mock funerals and rallies designed to garner news media attention and by making appearances in high-profile congressional hearings, inaugural ceremonies, and political party conventions. A key element to its success in creating awareness is its use of digital media.

Digital Media

The group's use of digital technology, including a Web site, discussion boards, text messages, and e-mail newsletters, is a vital component to its growth and success, particularly as it relates to its ability to organize and mobilize its constituency. The organization's primary Web site, www.codepinkalert.org, has been the center in its overall strategy for organization, mobilization, and publicity. The site serves as a clearinghouse of resources that local chapters and individuals can use to stage protests, write letters to newspapers or representatives, and take other collective actions.

Moreover, the Web site is an important tool of organizational cohesion because it allows for

issue clarification. The About Us section provides a summary of the group's beliefs. The news sections provide access to published news reports that illustrate how these beliefs are incorporated in the broader public sphere. Discussion areas and links to social networking accounts permit a decentralized membership to negotiate these issues in interactive forums.

The Act Locally section of the Web site provides various items to organize and mobilize collective action both online and offline. This section includes online petitions, a calendar of events, and informational resources. Of particular note is the Action Toolkit. Within this section, members find "jumping off points to assist your own creativity in being audacious, informed, and visible for peace." The toolbox allows members to download the PDF file for "How to Organize a Local CODE PINK Chapter," obtain talking

A CODEPINK member takes part in a four-month, all-day vigil in front of the White House, beginning November 7, 2002. The vigil inspired others, from private citizens to nongovernmental organizations, to stand with the group for peace.

points for media protests, and view pointers for staging a protest. For example, “Guidelines for Organizing a Protest” suggests ways for finding a location, getting permits, writing press releases, and sending e-mail alerts. These guidelines encourage protests not just in metropolitan cities, such as New York, Los Angeles, and Washington, D.C., but also in smaller towns and cities. Significantly, the Action Toolkit has strategic implications for generating mainstream offline publicity.

In addition to the Web site, e-mail newsletters serve an important function for coordinating and mobilizing action. End users can sign up for newsletters that provide information and updates about upcoming opportunities for action. All of these newsletters are connected back to the main Web site as well as the various social networking sites used by the organization.

The organization also uses a collection of social media to remain connected to members and other organizations with similar or sympathetic viewpoints. It has a section on its Web site dedicated to Pink Allies. It also contributes guest articles and blog posts on other organization’s Web sites, thus expanding the reach of its message beyond a potentially narrow or niche audience.

In addition to these resources that permit a one-to-many or many-to-many communication pattern, CODEPINK has also expertly used one-to-one digital media resources to coordinate their actions. When attending national media events, such as a congressional hearing, CODEPINK members have used text messaging as a way to provide instructions to the group member inside the hearing. For example, CODEPINK member Midge Potts attended the congressional hearings regarding the Valerie Plame Wilson affair and was able to situate herself on the camera screen, wearing a bright pink shirt that read, “Impeach Bush Now.” Thanks to text messages from her fellow CODEPINK members watching the live broadcast, she positioned herself in the camera’s view despite a full audience.

Implications of Digital Media Use

For activist organizations, CODEPINK’s use of digital media has significant practical implications. The group has been able to use these media outlets as a way to create group cohesion, despite

a decentralized organizational structure, to offer members a specialized forum for interaction, to coordinate group action, and to obtain publicity in a broader public sphere. From a theoretical standpoint, the group’s actions have important implications for the role of digital technology in allowing diverse groups to enter the discourse in the broader public sphere.

Cognitive Surplus

Cognitive surplus is a concept used to capture the “surplus” or extra productive labor time that people have in the new media age. Proposed by Clay Shirky, the term *cognitive surplus* refers to the amounts of time freed up through digital and online technologies. Shirky argues that people spend this surplus time engaging in a wide range of creative production online.

Using the example of LOL Cats, Shirky explains that most people spend their extra time on the Internet doing benign activities like creating and circulating captioned pictures of cats. He contrasts this to collaborative and crowdsourced projects like Ushahidi that aggregate individuals’ contributions to create useful, real-world tools aimed at solving real-world problems.

Comparing these uses of surplus time and labor, Shirky provokes people to consider all that they might accomplish together if they could harness our collective cognitive skills through collaborative online projects. What if, for every time someone created a LOL Cat image, they instead generated data, transcribed a document, or translated a text aimed at utilizing and generating civic virtues?

Shirky's take on cognitive surplus has its critics. One recurring objection relates to how Shirky elevates people's active involvement in online activities (however mundane) above any kind of passive consumption of television (however intellectually rich). His argument that creative online connection always trumps television watching draws criticism from those who see television viewing as a more dynamic and, quite often, social process. His view also raises questions from people who are critical of a "making is connecting" position that fails to account for the many ways in which social media and collaborative online forums are also used for antihumanitarian purposes (such as by neo-Nazi groups).

Contra Shirky, there are also those who disagree with the idea that people should convert their leisure time into free labor time—even if such work is being done for civic projects. This view draws attention to larger questions of waged work under capitalism, emphasizing the ways in which crowdsourcing creativity can reinforce a culture in which private companies profit and people's creative labor remains undervalued and unrewarded in the workforce.

Since Shirky first made his proposal, users and uses of social media have proliferated. While LOL Cats are still common across the web, Internet memes now picture a range of figures from Feminist Ryan Gosling to Willy Wonka, as web users create communities through sharing parody, political critique, statistics and worldviews—in addition to captioned cat photos. At the same time, crowdsourced and collaborative digital platforms have also proliferated, as Internet users co-construct everything from weather and traffic reports to localized aid relief.

The debate over whether or not the masses can be harnessed into more social-justice-oriented projects remains unresolved. But as discussions continue, Shirky's conception of cognitive surplus offers a terminology through which to think

about the time produced in, and by, people's digitally connected lives.

Colbert Report, The

As one of the original "reporters" and cowriters on *The Daily Show*, Stephen Colbert developed a persona that parodied ultraconservative television journalists and political pundits. When Jon Stewart joined *The Daily Show*, Colbert's character became a foil for Stewart's liberal perspective. In an attempt to keep Colbert with Comedy Central after Steve Carell, another of *The Daily Show*'s popular reporters, left to pursue films, Colbert received his own show, *The Colbert Report* (with both Ts silent), on October 17, 2005. Airing Monday through Thursday, *The Colbert Report* utilized some of Colbert's more popular segments including "The Word," which parodied Bill O'Reilly's "Talking Points." The similarities include captioning, although Colbert's often mock what the actor is saying. Colbert's show focuses on his conservative, egotistical persona rather than a standard evening news format. It thus becomes a satire of both news and talk show programming. *The Colbert Report* has been nominated for seven Emmy Awards, and Colbert's coined term *truthiness* was named 2006 Word of the Year by Merriam-Webster.

The Colbert Report heavily utilizes social media through the show's Web site, Google+, Facebook, Twitter, and "The Word" app for the iPad. In fact, Colbert was awarded the first-ever Golden Tweet Award for the most retweeted tweet in 2010 for his comment about the Gulf oil spill. Colbert tweeted, "In honor of oil-soaked birds, 'tweets' are now 'gurgles.'" The tweet was retweeted more than 44,000 times. Prior to 2010, however, Colbert learned the power of the Internet in August 2006, when he created a green-screen challenge as a result of a "Better Know a District" segment that featured Colbert wielding a light saber in front of a green screen. Fans, on their own, edited the footage and posted their results online, mostly on YouTube. The popularity of the videos resulted in Colbert issuing the formal challenge to create the best video from the August 10 footage. George Lucas appeared on the show on October 11 to showcase his own entry. Two other green-screen challenges were issued later based on footage from a music video and John McCain.

Not only does Colbert use social media to rally his Colbert Nation, but he also mocks sponsorship and social media campaigns as in his parody of Nissan's Leaf Wave campaign or his "Hail to the Cheese: Stephen Colbert's Nacho Cheese Doritos 2008 Presidential Campaign Coverage." But, as is often the case, Nissan and Doritos benefited from Colbert's teasing as seen in an increase in national media coverage as well as increases in Twitter followers and "likes" on Facebook. Such an increase in popularity after an appearance on the show has been called the "Colbert Bump." Perhaps this is why he was approached by Wheat Thins in February 2012 for a "sponsortunity" (a word coined by the actor to satirize overt sponsorship of newscasts). Colbert read on air from a corporate branding memo he was sent by Wheat Thins, the sponsor of the show, and he devoted the middle third of his February 23 program to making fun of what the memo contained. He ended by placing 17 Wheat Thins in his mouth at one time, which was against the advice of the memo. Sponsors are willing to risk Colbert's insults in order to receive the Bump.

Colbert has attempted (facetiously) to enter into the realm of real-world politics. In 2007, he attempted to be placed on the Democratic

presidential ballot in his home state of South Carolina. He held a rally at the National Mall, March to Keep Fear Alive, on October 30, 2010; the same day Jon Stewart held his Rally to Restore Sanity. Both marches had their own Web sites, Facebook pages, and Twitter accounts. Attendance at the event reached more than 200,000, while 4 million streamed the event live over the Internet.

Neither politicians nor the media are safe from Colbert's humor. On September 5, 2012, Colbert introduced the Internet Numbo-Tron 3000, which turns out random integers without providing any supporting information, as a way to mock the media's extensive discussion of Michelle Obama's record tweet numbers. Perhaps most significant in terms of Colbert's use of social media is the star's successful creation of a SuperPac, Americans for a Better Tomorrow, Tomorrow. Colbert's SuperPac has raised more than \$1 million through online donations. The influence of the SuperPac can be seen in its receiving a Peabody Award in April 2012 for its parodying of the political money system and the corresponding Supreme Court decision.

Influence of *The Colbert Report* and the Colbert Nation

Colbert's influence on social media, in spite of his "fear" of technology, can also be seen in the many naming "awards" he has won (although many were invalidated) through social media write-in campaigns he encourages on air: a bridge in Hungary, the mascot of the Saginaw Spirit, and a *Time* 100 online poll. NASA was forced to deal with the strength of the Colbert Nation when fans voted to name the new International Space Station module after Colbert. NASA instead named a treadmill C.O.L.B.E.R.T. (Combined Operational Load Bearing External Resistance Treadmill). Sweden, however, has been able to keep Colbert from running its Twitter account (@Sweden), which is controlled by a different Swedish citizen each week. He had wanted to make tweets using the hashtag #artificialswedener. Such mobilization is a demonstration of Colbert's influence over the 18- to 35-year-old demographic.

Colbert has experienced the downside of social media for celebrities. On February 17, 2012, fans took to the Internet in concern when Colbert missed two tapings (after the audience was

already seated). Colbert also stopped updating his Facebook and Twitter feeds. In 24 hours, Colbert became one of the top Google searches. Fans feared that the show had been cancelled, but the reality was that the super-private Colbert, unlike his publicity-seeking TV alter ego, was spending time with his ailing mother out of the spotlight.

racial disparities in education, the criminal justice system, and in health care, as well as the growing gaps in economic resources, voter intimidation, police brutality, and media accountability.

Sometimes called a black MoveOn.org, Color of Change draws its influences from that digital activist group, which has nearly 7 million members. MoveOn.org was founded in 1998 during the President Bill Clinton sex scandal, when the group circulated a petition to censure the president and move on. The response to that effort helped launch the organization, which has served as a model for the political efforts of similar groups nationally and internationally. Color of Change has been called a civil rights movement for the social media age that seeks to move beyond traditional methods of organizing.

Color of Change is often contrasted with the historic civil rights organization, the National Association for the Advancement of Colored People (NAACP). The NAACP has about 250,000 dues-paying members, while the Color of Change reports 800,000 mostly middle-class, online members, ages 35 to 55, about half of whom are white. Its members pay no dues but contributed about \$250,000 through online donations and tripled its membership during a three-month period in 2007 to pay the legal fees of the defendants in Jena Six, a civil rights case in Louisiana.

In fact, NAACP President Ben Jealous has said organizations like the Color of Change are replacing the black press's historic role in "publicizing injustices and rallying public sentiment." Although Color of Change has been critical of the NAACP for its perceived failure to attract and encourage political advocacy among younger African Americans, the two groups worked together to coordinate efforts in the Jena Six case, in which six black teenage boys were charged with attempted murder in a schoolyard fight with a white boy. A protest of 20,000 people in the small town of Jena, Louisiana, demonstrated the Color of Change's ability to mobilize people around a cause using new technology. And, the grassroots actions put pressure on the governor and the district attorney to subsequently reduce the charges against the teens to a misdemeanor.

The organization has been involved in other events, including raising more than \$10,000 in an Internet campaign to help Donna Edwards's best

ColorofChange.org

ColorofChange.org is a grassroots political action organization founded by California activists James Rucker and Van Jones in the aftermath of Hurricane Katrina, which devastated New Orleans in 2005. The organization's stated goals are threefold: to make government more responsive to the concerns of African Americans, to amplify and strengthen their political voices, and to bring about political and social change. The organization took advantage of a perceived vacuum in black political leadership to take on a variety of issues. It focuses on concerns such as

incumbent Representative Albert Wynn. Color of Change has also been cited in the grassroots effort to force conservative commentator Glenn Beck off the air after its members undertook an e-mail writing campaign to pressure advertisers to drop his television show. Not all of its efforts are successful, however. The organization was not able to influence the outcome in the case of Troy Davis, a black Georgia man executed for a murder that supporters said he did not commit.

Still, Color of Change appears to have tapped into a narrowing of the digital divide as access to cell phones fill the technology gap between haves and have-nots. Significantly, in the past decade, the number of blacks or Latinos who use the Internet has nearly doubled from 11 percent to 21 percent.

The organization has been successful in engaging younger African American voters, a group that is more likely to use mobile technology, according to the Pew Center for the People and the Press. Pew reported that about 36 percent of African Americans used their cell phones to participate in the 2010 midterm elections, by far the largest group of youthful voters as compared to white and Hispanic voters. In addition, the Pew Internet and Family Life Project has found that minority Internet users are more than twice as likely to use social media tools such as Twitter as are white Internet users.

As more African Americans access the digital realm, Color of Change joins a coalition of bloggers, black radio hosts, and activists known as the Afrosphere, a group focused on black political, cultural, and economic self-determination that is not often reported in mainstream media. However, the organization's political strategy is not only online; it uses a multipronged effort that includes nationally coordinated events, ad placements in TV and print outlets, and coordination with affinity groups to magnify its impact. Online efforts include the use of social media, e-mail lists, and phone calls to accumulate data about members, which allows it to better track the interests of members and to target receptive audiences. As a result, the organization has learned what issues will mobilize its constituents.

Committee to Protect Journalists

With the expressed purpose of protecting freedom of expression and democracy, the New York-based Committee to Protect Journalists (CPJ) has championed the cause of journalists worldwide

for more than 30 years through its research and advocacy. According to CPJ's Web site, hundreds of journalists are killed, imprisoned, or harassed each year. CPJ is proactive when journalists are attacked, censored, or otherwise impeded in their work. These efforts include publishing letters to prominent parties stating the group's position on issues impacting freedom of the press; alerts when journalists are adversely impacted as a result of their work; data on journalists killed, imprisoned, or exiled; an annual "Impunity Index" identifying cases where parties guilty of killing or otherwise impeding journalists are not held accountable; a "Journalist Security Guide" to help journalists better protect themselves; and an annual report, "Attacks on the Press," detailing instances of press hindrance worldwide. Its annual International Press Freedom Awards honor brave journalists who do their jobs in spite of the dangers they face.

CPJ works with governments, nongovernmental organizations, and other entities to combat freedom of the press violations, with major campaigns against impunity—CPJ states that an average of more than 30 journalists are killed each year, with the perpetrators usually going unpunished—and against criminal prosecution of journalists in instances of alleged slander and libel. The group actively engages social media—including Facebook, Twitter, and Google+—to empower journalists and others concerned with the protection of the free flow of information. CPJ's social media sites are available regionally, including in Asia, Africa, and the Americas, and are available in several languages.

Formation and Funding

Formed in 1981 by a group of U.S. correspondents concerned about the dangers facing their colleagues in other areas of the world, CPJ launched its first advocacy campaign in 1982 when three British journalists were detained in Argentina while covering the Falklands War. A letter from CPJ Honorary Chairman Walter Cronkite was instrumental to their release.

Funded by foundations, corporations, and individuals, CPJ's staff of 27 currently includes regional specialists; a network of representatives worldwide, including Mexico City, London, Nigeria, Nairobi, Bogota, Brussels, and Bangkok;

and an Internet advocacy coordinator based in San Francisco. Its 35-member governing board includes noted journalists from around the world.

Attacks on the Press

According to its flagship publication, "Attacks on the Press," released in February 2013, 70 journalists were killed as a result of doing their jobs in 2012—a 43 percent increase over the year before—and 35 journalists had disappeared. Additionally, the report stated 235 journalists were imprisoned in 2012—53 more than the year before and the highest number since the report was started in 1990. Syria was identified as the deadliest country for journalists, with 28 killed there in 2012, followed by Somalia with 12. And, for the first time, the report also included a "Risk List" of countries where press freedoms are increasingly being threatened. The list includes Syria, Brazil, Somalia, Pakistan, Russia, Turkey, and Ecuador. Syria, Turkey, Ethiopia, Vietnam, and Iran were cited in the report for imprisoning journalists, and a trend of increased cyberattacks on individual journalists and news organizations was also noted. Additionally, the report identified increases in governmental intolerance to dissent, as well as repressive legislation. In its recent press conference at the United Nations announcing its latest "Attacks on the Press" report, CPJ stated that many of the journalists imprisoned or killed in 2012 were "citizen journalists," who are becoming increasingly important to news organizations throughout the world for their first-person reporting. Other major sections of the report include the areas of religion, law, security, censorship, and technology. CPJ plans additional events throughout the world promoting the report.

Recent alerts published on the group's Web site include "Pro-Kurdish Reporter Sentenced to Jail in Turkey"; "Journalist, Family, Attacked with Acid in India"; "In Mali, a Journalist Stabbed for his Critical Reporting"; and "Letter Bomb Sent to Home of Colombian Journalist."

CPJ's monitoring of journalists' security is updated regularly through its Journalist Security Blog, including editors, publishers, writers, producers, photographers, technicians, camera operators, and directors of news organizations in its definition of "journalists." Abductions, attacks, threats, killings, censorings, expulsion,

harassment, imprisonment, vanishings, and legal actions against journalists are monitored. Journalists can contact CPJ for help when covering the news, traveling on assignment, or in an emergency. As well, the organization's Journalist Assistance Program aids journalists in serious situations resulting from their work, such as when they are physically assaulted and need medical care, when they have specific needs while imprisoned, and when they need to go into exile or hiding to escape threats.

The organization recently reported that a record number of journalists were killed in the Iraq War—at least 150, as well as 54 media support workers in Iraq between March 2003 and December 2011. Most of the journalists were murdered in targeted assassinations resulting from their reporting.

In other recent activities, CPJ Executive Director Joel Simon wrote a letter to British Prime Minister David Cameron warning Great Britain against plans for a Royal Charter system of press regulation. As well, the group was instrumental in the approval of new Mexican legislation that will put in place a constitutional amendment giving the federal Mexican government greater jurisdiction in prosecuting crimes against freedom of the press.

In 2012, CPJ honored four journalists who persevered in their work despite dangers: documentary filmmaker Dhondup Wangchen of Tibet, currently imprisoned in China; Ferghana News reporter Azimjon Askarov, currently serving a life sentence in Kyrgyzstan; Mari Konig of Brazil's *Gazeta do Povo*, who was attacked and threatened following his reporting of corruption and human rights violations; and Mae Azango of Liberia, who was forced into hiding as a result of her reporting on female genital mutilation. Additionally, Alan Rusbridger, editor of the *Guardian*, was recognized for his dedication to freedom-of-the press issues. The awards dinner raised \$1.6 million in support of CPJ's work.

Communication

Communication is used in a broad sense to include formal, informal, verbal, nonverbal, print, individual, collective, face-to-face, and virtual forms. The main objective here is to discuss the impact of communication technologies on the transformation of social and political relations, as well as the impact of social and political relations on the way communication technologies are used. Diffusion of information through various forms of communication may foster political participation, dialogues, civic engagement, and political education. Recent research has documented the growing importance of communication technologies and Internet media as uncensored platforms for sustaining freedom of expression as well as for disseminating their users' political views and activities.

Studies of contemporary political transformation consistently make reference to new patterns of communication among key actors. Communication is viewed as a networking or exchange of ideas between two or more individuals or groups with an aim to achieve better mutual understanding concerning certain issues. With regard to political participation, traditional coffee houses, cultural clubs or societies, and political salons have been effective means of communication allowing individuals to engage in social and political movements. However, communication is not simply the device by which individuals know each other but also a powerful tool through which individuals control each other.

As Manuel Castells argues, the transformation of communication, caused by the explosion in wireless communication in the 1990s as well as by technological convergence between Internet wireless communication and multiple applications in the 2000s, has resulted in the empowerment of communicative capacity worldwide penetrating both public and private spheres of people. Citizens have become increasingly empowered to participate actively in political domains.

The one-way communication of radio, television, and print media provide information to an audience but cannot solicit immediate feedback. In contrast, the two-way communications of the Internet and cyberspace encourage political engagement and allow for mutual feedback. Cybercommunication or social networking refers to a type of online community that depends on a computer-based simulated circulatory milieu through which the participants or users interact with one another. This type of interaction and immediate social reaction to new phenomena tend to create special kinds of written visual contacts of a global form.

Communication Technologies

Communication technologies and social networks including the Internet, Google, Facebook, Twitter, YouTube, e-mail, mobile phone, texting (short messaging service, or SMS), forums, and blogging, to mention a few, are used not only as means to maintain social connectivity but also as mobilizing tools to express social and political demands, such as social justice, freedom, and democracy, among other civil rights. For example, in many countries, the Internet has contributed to a more active, critical, and politicized citizenry, where citizens are no longer passive receivers of state-oriented media. Put differently, politically oriented and mediated communications do not merely express people's political ideologies but also generate, establish, and proliferate their political ideologies in public zones.

The rise of online and cybercommunication has significantly impacted the practices of political leaders as well as the content and fashion of political communication. Politicians seeking to be effective and influential aspire to develop skills in various and multiple domains. The most important skill, however, is the ability to

communicate. Communication implies eliminating contradictory elements that might exist between individuals or groups. Successful political actors are those who are able to achieve their goals and resolve political and social problems through dialogue, effective communication, and compromise.

Communication is a process that involves sending messages or symbols in such a way as to help the receiver understand the meaning the sender or communicator intends to make. Good communication might lead to effective persuasion in which communicators try to convince other people to adopt a certain view or change their attitudes or behaviors regarding an issue by the transmission of a message through free choice. For example, electoral competition between more or less united or consolidated political parties is the main framework in which much political communication and persuasion take place. News is designed in order to persuade or tell narratives that are appealing and make sense to audiences, rather than in order to deliver the most comprehensive information possible.

Communication technologies play critical roles in the presidential, parliament, or party election processes through both offline and online political campaigning. A well-known example of using smart communication for political purposes is Barack Obama's 2008 presidential campaign. By using interactive Web 2.0 tools and social networking technologies, Obama's presidential election campaign changed the strategies by which politicians recruit volunteers, defend against critical attacks, and communicate with supporters. The campaign manipulated YouTube for free advertising. Because of their friendly and uninterrupted features, YouTube videos were more effective in the campaign than television ads.

The manipulation of the Internet in organizing Obama's supporters did not only save time and money but also helped people repeatedly and enthusiastically listen to his speeches. In addition to text messages, Obama supporters used a social networking site, created with the help of a Facebook cofounder, through which they were able to log in and find lists of people they could call. Such a communicative strategy shows a strong tendency toward more personalized and professionalized styles of campaigning.

Online, grassroots cybercirculation is characterized by nonhierarchical communication that draws on the various interactive applications of electronic communication. One of these applications is blogging. A blog, typically created by a single or anonymous person, is a personal Web site that contains news or information in the form of diary. Bloggers manage political communications in a more autonomous way. This means that a blog allows the user substantial freedom to partake in political activities criticizing oppressive regimes and calling for social reform or revolution. Recent uprisings have demonstrated that activists in different countries shared their experiences through e-communication including blogs. For instance, Arab and Muslim blogs have become crucial aspects of global or transnational communication due to the accessibility and sociable connectivity through which individuals or users can form a resisting force against the dominant power of the ruling elite.

Electronic communications and social media actively contribute to creating their own social role as privileged channels of democratic politics. In other words, the role of cyber- and mediated communication is crucial in facilitating democratic transition. This is clearly shown in the impact of new communication technologies on political movements and democratic transitions in the Middle East.

Communication and the Arab Spring

In traditional societies such as Arab or Middle East countries, there is an acute juxtaposition of various forms of communication including, for example, the local and global, indigenous and imported, traditional and modern, oral and written, and idealistic and pragmatic. However, there has been a recent preference for applying new communication technologies. Such new communication technologies and social networks have been effective tools in the unprecedented phenomenon of the Arab Spring bringing down authoritarian regimes and political dictators in several Arab countries including, for example, Egypt and Tunisia. The Arab Spring shows how online and offline communication played central roles not only in mobilizing people to engage in political revolts but also in shaping political movements. Also, during the Arab Spring, people in other countries collaborated with Egyptian

and Tunisian protesters through online communication tools to produce and share information about the revolutionary movements.

In the Middle East, both males and females of younger generations, constituting more than 65 percent of the overall population in the region, are active users of communication technologies. Young people between 15 and 29 years old make up around 70 percent of Facebook users in the Arab region. The Arab young generations have expressed pride in their ability to combine both local culture and modern, global ways of life. They use both Arabic and English in their offline and online communication. They also tend to participate in risky activities and uprisings more than the older generation. Change has become the key word used by the young generation with reference to changing old-fashioned and corrupt political systems.

According to *Arab Social Media Report*, coauthored by Fadi Salim and colleagues, the percentage of female users is lower than male users. Globally, the gender breakdown of social media usage, represented in Facebook for example, reflects real-world demographics, with the number of male and female Facebook users being roughly equal. This trend, however, is not applicable to the Arab region, where only a third of Facebook users are women. However, the number of female users is steadily increasing; it reached 33.5 percent in 2011 compared to 32 percent in 2010. Through utilizing cybercommunication and social networks, women have become active participants in new forms of leadership. However, this statement does not negate the fact that Arab women are not merely cyberactivists but also active participants on the ground, partaking in and organizing political rallies and protests.

During the January 25 Egyptian revolution, a female activist in Cairo stated that political activists used Facebook to schedule the protests, Twitter to coordinate the activities, and YouTube to disseminate the news worldwide. The participation of Arab women in the social and political transformations taking place across the Middle East has played an instrumental role in challenging stereotypes about Middle Eastern women as oppressed and submissive. Women have played leading roles comparable to men in organizing and participating in political and social movements in Egypt, Tunisia,

and Yemen. They have participated in transforming the political landscapes in their countries.

Merlyna Lim argues that mediated communication or social media have been an integral part of political activism of Egyptians for years, with 54 out of 70 recorded street protests from 2004 to 2011 substantially involving online activism. Social movements, especially protests, can also be understood as networks of people brought together by a common goal or interest. Social movements as social networks can also be comprehended in terms of an initial core made of densely known groups with stronger ties that mobilize weakly linked individuals, thus transforming messages of discontent into a mass movement.

Communication technologies such as mobile phones and the Internet facilitate the cooperation of the users and free them from the government's exploitative and misleading media. During the corrupt and repressive regime of Hosni Mubarak, in which emergency (martial) law was applied and street protests were considered illegal, therefore to be crushed by police brutality, cybercommunication and blogs flourished and increased as alternative

means for opposing the Egyptian regime. Similarly, in Tunisia, forms of social media, including blogs, commented on the corrupt and illegal practices of Zine al-Abidine Ben Ali's family and government.

In Egypt, the government or state-run online network, a top-down communication, was used by the Mubarak regime for providing people with false information about economic and political conditions. Egyptian political activists, including members of the Muslim Brotherhood, have used various forms of communication including the Internet, forums, and blogs to express their political views challenging government media during Mubarak's oppressive regime. The Internet has facilitated change in the balance of power and levels of freedom among actors because it is more resistant to state control and censorship than most traditional forms of mass media. Younger bloggers, some of whom are sons and daughters of imprisoned political activists, including the Muslim Brotherhood, were active in resisting the oppressive regime through electronic communication and the Internet. During the January 25, 2011, revolution, when Mubarak's government

Crowds of young people turn out for a demonstration calling for political change in Morocco on June 9, 2011. During the Arab Spring, protesters from other Arabic countries were able to communicate with Egyptian and Tunisian protesters through online social media and other communication tools to collaborate and share information about the revolutionary demonstrations.

temporarily shut down the Internet, the reaction of the protesters intensified in such a way that they attracted regional and global attention, thus garnering support for their plea for increasingly democratic rule.

pro-peace and social justice movement during a time of terrorism, war, and intense political struggle." Internet activism has become a tool of outparties in conflict, groups of people or sectors of society who are feeling marginalized, disempowered, or treated unjustly. More than being a tool for organizing people with like-minded social sensibilities, ultimately, these new technologies have become new ways of declaring and registering conflict with in-groups or ideas, be they autocratic regimes, despotic rulers, or unpopular governmental policies. In some ways, as Joss Hands indirectly reminds readers, dissent, resistance, and rebellion in a digital culture is simply a new technological manifestation of activism against a prevailing authority's domination and exploitation.

Social media therefore becomes revolutionary as simply a new variation of "the scream" against oppression, as defined by John Holloway. The scream is two-dimensional: It is a scream of rage; more important, it carries within it "a projection of possible otherness," therefore the hope of change. Leah Lievrouw echoes this sentiment by implying that the roots of alternative and activist new media lie also in the fact that they are decrying the present and insisting on the creation of a different future.

As mechanisms of protest and insurgency, social media can therefore potentially play a role in far-reaching social and political reforms and, therefore, have become part of the way in which social and political conflicts are ultimately managed, resolved, or transformed due to the structural social and political changes. There is, however, still very little agreement about exactly under which circumstances the Internet and its ever-growing range of concomitant technological tools become agents of change in social conflict, although some degree of empirical testing is beginning to explore theory in this area.

A recent study by the U.S. Institute of Peace, subtitled "New Media and Contentious Politics," concluded that, while new media such as blogs, Twitter, Facebook, and YouTube have played major roles in episodes of contentious politics as activist tools in replacing authoritarian regimes and in promoting freedom and democracy, "policy makers and scholars know very little about whether and how new media effect contentious politics."

Conflict Resolution, Social Media and

According to Richard Kahn and Douglas Kellner, the global Internet has created "the base and basis for an unparalleled worldwide anti-war/

There is, however, some agreement that alternative and activist new media are inexpensive and powerful tools for challenging mainstream or popular culture, let alone political elites. Note, for example, this all-encompassing perspective by Leah Lievrouw:

Web sites, mobile phones, digital photography, video and audio, blogs, wikis, file sharing systems, social media and open source software all permit social groups with diverse interests to build and sustain communities, gain visibility and voice, present alternative and marginal views, produce and share their own do-it-yourself (DIY) information sources, and resist, talk back, or otherwise confront dominant media culture, politics and power.

These objectives are mainly achieved in how new media technologies assist people in assessing information and each other.

Leah Lievrouw concludes that “mobilization is a core concept across social movement theories” and that new media share this in the way that “people convert their collective concerns into collective action to bring about change.” Moreover, she cautions, in the words of Lauren Langman, that “these new kinds of Internet-based social movements, cyberactivism are fundamentally new and require new kinds of theorization,” and notes, moreover, that various scholars caution that “even the most tech-savvy contemporary movements do not rely solely on the Internet and new digital technologies, but use a mix of mass media and new media systems and techniques to communicate with their participants and with the wider public.”

The power of social media appears to lie in the extent to which they play roles in out-group formation, albeit electronically or in person at designated places of protest (such as Tahrir Square in Egypt during the so-called Arab Awakening), and also to the degree that these forms of oppositional communication empower out-groups to use their newly found voices to interact with powerful in groups in insisting on social and systemic change. To invoke a simple Hegelian model of conflict analysis, in confronting the political structures of their day, social media actors put forward a new antithesis to the thesis or prevailing power of the day.

In many ways, there is nothing new to this structural representation of social conflict; what is different here is the way that the conflict is enjoined, or made active, in that social media allows for a more economical and faster form of conflict declaration and, therefore, an escalated form of out-party activism (meaning those who want a change in the status quo).

New communication tools simply speed up the disseminating process of protest by creating, distributing, receiving, and consuming content in ways that have not been technologically possible before. The utility and impact of these technological innovations as novel and very hard-to-control antithetical forces that recruit and enlist others randomly became more fully realized during the various Arab protests since December 2010. However, the basic and universal conflict dialectic is still at work here. James Laue and Gerald Cormick frame conflict commonly as a social phenomenon that arises “when existing power arrangements are seen as non-legitimate and resource allocation as inadequate.” Moreover, that

. . . crisis occurs when the holders of power (in-parties) being challenged by subordinate groups (out-parties) define the situation as serious enough to take new and unusual action to avoid or minimize what they perceive to be severe costs.

One could therefore argue that the social media and resultant in-person protests were in pursuit of basic human needs that James Laue and Gerald Cormick define as freedom, justice, and empowerment or self-determination. In a number of cases during the Arab revolts, notably in Tunisia and Egypt, the social and political public spheres in those countries were transformed. In that sense, social media actors, however indirectly, became initiators of an indirect negotiation process in an attempt to ultimately resolve or transform the prevailing political system.

In the process, social media activism became the most successful example to date of the potential, and one could argue far from fully realized potential, of the interventionist nature of these new information technologies. This claim can be made in spite of the inability of cyberactivists to

fully translate their online and in some cases resultant in-person protests into recognizably changed or new political systems, with Egypt as the most notable case in point. In spite of the fact that the Hosni Mubarak regime came to an end because of the crisis that occurred during the Arab revolt in which social media played a transformative role, these same activists recently took to the streets again two years after these events because of their disillusionment over the seemingly autocratic tendency of the newly instated President Mohamed Morsi and the political struggles for power that are still occurring in that country. At best, the social media awakening in Egypt has thus far contributed to a rethinking or internal restructuring of how the country is managed without necessarily leading to transformative political change that will satisfy these activists.

In spite of formulating new agendas and the discussion of once-forbidden topics, social media's usage is not necessarily effective and, some would argue, simply ineffective in creating or leading directly to new social and political systems. This apparent inability to directly impact the resolution and transformation of social and political change lies at least in part in the fact that social media activism is not as a rule represented by organized and leader-driven entities. While creating a dialectic for discussion or pressure for change, social media essentially represents a leaderless out-group phenomenon, and often only represents a relatively youthful, educated, and economically sound part of the society. There is, however, some preliminary support for the idea that the social media may be useful as a platform for affective and/or artistic expressions of political attitude. Experiments in using social media to create virtual versions of political satire, theater, and poetry suggest that, in some cases, they may be a valuable vehicle for archiving public sentiment collected through creative ethnographic methods.

Without ultimately being able to lay claim to having contributed to system change and to rectifying social injustices, social media activism can be written off as mostly having nuisance value for oppressive regimes, but will ultimately be controlled by censorship and by legal and security devices to minimize the role these technologies can play in fomenting the need for structural

change addressing the deep-rooted sources of conflict that exist in many societies. However, the social media revolution is a part of much larger technological and societal changes in a brave, new, digital world. In that sense, the social media revolution is not utopian and will most probably only revert back to more social and less activist roles in societies where the necessary structural changes have occurred. Barring that, social media activism will become a standard part of social life and out-group formation.

Constituencies, Social Media Influence on

A constituency describes those individuals represented by an individual chosen or appointed to act on their behalf. Constituencies can be various in type, kind, and composition. For example, the director of a food program in a city serves a specific constituency within a set border. Its enabling statute or initial legislation parameters for operation are included as well as its base of operation, target constituency, and enforcement powers. The director of the food program is either appointed or chosen within a merit system by application and interview. Once selection occurs, the director becomes acquainted with the powers inherent in the position and a job description listing the major tasks and duties.

Traditionally, representatives are identified from a constituency and determined to be the best fit for representing that constituency through some form of vote or application process. Of course, with social media, how one defines and describes the concept of a constituent is a moving target. What could once be counted on as solid support around one or more ideas, social media has redefined to be the first step in the proving ground toward operationalization.

Serving Constituencies

Depending on where one is, constituencies can be limited by law to a certain group that is allowed to participate in government, or constituencies can be pools of individuals with equal access to government. Thus, the definition of constituencies can be region-specific and state- or country-specific. A user can visit a blog or discussion forum on a Web site that is housed in another country, express views, link Web sites and video, and then be told by citizens in that country that what happens in “our” country is none of the user’s business. Social media groups then can limit the constituency themselves, be it international constituencies or even city or state constituencies. In the past few years, there has seemingly been a global push in some areas by individuals in those areas to become more inclusive in the governing process. In early 2011, in Egypt and Tunisia, social media provided daily updates on the progress of

individuals calling for a new constitution, greater access to government, and better representation as well the desire for individual freedoms.

Current ways to serve constituents vary from state to state and from country to country. One of the most common ways being used to provide constituency service is through communication options available on Web sites. A majority of agencies, departments, and politicians use Web sites to solicit ideas and feedback from their constituents. Constituency services used to be conducted face to face and through mail, conventions, town hall visits, and the like. Social media has changed the nature and description of constituency service due to the fact that posts and updates to social media sites may require immediate responses or immediate posts that encourage followers to ask for responses or clarifications.

Social Media and Reform

Social media has built a virtual society along the lines of inclusiveness, expansion, immediacy, and a lack of concrete institutions. In doing so, it has reconditioned the constituent and the services it requires. Prior services that have gone unquestioned and accepted now see demands from constituencies for immediate reform often through the means of social media. Ombudsman services or constituency services have become redesigned to capture the needs of those using social media, especially when those individuals are able to tell their friends and followers that their questions have gone unanswered. Neglecting a constituent who uses social media multiplies the chances for negative feedback from other constituents who may be supporters of the politician or representative. It also intensifies the response from other people regarding the neglect. Furthermore, the archive function inherent in the Internet can be a reminder of each instance that a representative was inactive and unavailable.

The costs to use social media for updates, posts, blogs, discussion forums, and the like are relatively inexpensive. This differs from the high costs of mail, travel, personal appearances, and speechwriters in order to reach the constituency in the system in place and practiced prior to the Information Age. The ease of devices and the availability of affordable equipment and desktop and mobile applications smoothly deliver services

to constituents in a few hours what it used to take a small army to do in weeks. Politicians as well as constituents have expressed a need for money-saving efforts to produce results. For individuals seeking it, Internet connection, iPhones, Androids, as well as other mobile devices are accessible through the purchase of particular equipment and usually a monthly fee. Social media operates on the virtual structures built into these devices and is enhanced by mobile applications. Constituents own this equipment and use the virtual structures for a number of things. The politician or representative does not have to create or invent these structures or this equipment. What he or she needs to do is get involved in the virtual groups that already exist or within the existing structures create groups of their own. Users of social media are alerted to the creation of a group formed by a politician or representative in a number of ways, and they can decide to join that group. Some who join may be constituents, some are not constituents, and others are just interested and may be from anywhere on the globe.

Increased Visibility

Adult usage and registration on social media sites has increased tremendously, with one in eight people being on Facebook in the current environment and with more than 30 percent of adults on some type of social media overall. If one tried to contact someone in Tahrir Square in Egypt during the 2011 uprising, or someone in Occupy Wall Street in New York or Occupy L.A. (Los Angeles) during those tent city occupations, surely social media would have been the most efficient source. A new constituency was created during those protests, and the world took note. If politicians showed up during the protests, their appearances and words were tweeted in real time to the world. If they held up any signs, shook hands with someone, or sat in on a teach-in, the photos of these exchanges were texted, tweeted, and uploaded to numerous Facebook and YouTube accounts.

Appearances like these have changed the relationship of representatives to their constituencies. In the case of Tahrir Square and the protests against then President Hosni Mubarak, the lack of appearances by politicians was viewed as a negative, and accusations went out that any politician not with the citizens in Tahrir Square had

to be against the citizens. During the tent city occupation of cities in the U.S. Occupy Movement, politicians visited a host of cities, including New York, Atlanta, and Los Angeles, often tweeting messages to constituents while there. Although no specific legislation was passed as a result of the Occupy Movement, portions of the issues the occupiers requested were passed in separate forms in several pieces of legislation. There is no doubt that the attention given to the events in Tahrir Square, Occupy Wall Street, and occupy events around the world called attention to income inequality, social inequality, and education loan and mortgage debt.

The new constituency through social media has forced the redesign of bureaucratic structures. Social media by its inherent foundation calls for the destruction of generally accepted bureaucratic structures. Traditional structures were rigid and hierarchical and operated through chains of command. The chain of command was how things got done, how communication was transferred, and how rewards were given. Social media allows anyone with a fast thumb to become the most important person in the group and thereby the one to follow. In the protests of Tahrir Square as well as in the Occupy Movement it was not uncommon to hear that social media leaders one came to recognize were first-time leaders due in large part to their Twitter or Facebook followings. From these cases, the new constituency can be seen as a subset of a subset of a constituency.

The original constituency expanded to a larger constituency because of the growth of social media. Social media generates group after group after group because of the invitation to friend as well as the dissemination of photos and videos that are being constantly uploaded and updated. It is this expanse of support and linking of constituents to other indirect constituents that has authors of social media asserting that constituency services can no longer be defined or performed as they have in the past. The political element that used to run through an issue causing a representative to do something about it is no longer completely definable. Social media keeps defining it with every new friend and every new group. Thus, constituency services have become harder to accomplish as the services that were once essential and expected are redesigned

in real time due to the contributions of others in other groups.

Social media creates overlapping issues and overlapping constituents. What that means is that, if a powerful group of constituents leans one way on an issue but through social media is outnumbered or absorbed by another group of constituents, then issues and constituencies can be lost or eliminated. What social media has not been able to do as yet is to distinguish between the overlapping issues and constituency issues. Online petitions do not provide a mechanism for distinguishing a particular constituency, and therefore, the issue being promoted or debated is represented by a mesh of voices. Where once these voices were housed in a single choir or constituency, social media allows all voice types and levels to make music together. It is often up to the politician to find the soprano, tenor, and bass voices that are indeed his or her choir of constituents and try to provide services to them to their satisfaction. The old norms and traditions of constituency services will not hold the attention of today's constituents as long as it used to and should be considered for revision.

Needs for the Future

In order for some level of effective constituency services to be achieved, politicians will need to use social media to recruit individuals who can lend their expertise to the social media aspect of constituency services. Other elements are always being added to social media options. A user knows the new options and their uses. Some even help design new uses from the interaction they encounter between other users of social media. Politicians hoping to deliver previous levels of constituency services will need to employ individuals to adopt and adapt to constituent demands. Once the Internet looked like a tool that would be more of a research professional instrument with few envisioning the use expected today. Social media, like the Internet, is here to stay. It has taken on a life of its own, although it is not yet truly out of diapers. Just when constituents had gotten used to e-mail and text messages, Facebook, Twitter, Rich Site Summary, sometimes called Really Simple Syndication (RSS) feeds, Flickr, and other social media options were born and instantly used while forming new and expanded constituencies.

Constituency services are not the only area of constituency that is impacted by social media. The operationalization and implementation of policy is also impacted. Depending on the level of social media, the degree of policy creation and implementation can fluctuate. While social media instantly captures the rural citizens' views and opinions on policy, these views may still be just that—views. While social media can crown new kings and queens of opinion, it can also highlight the disconnection of the constituent from policy. Social media does not make one instantly brilliant if that person does not know where to look for information. Thus, social media can continue to disseminate erroneous information and ideas and, if influential enough, can be translated into policy. Erroneous policy in implementation is enraging due to the practice of the legislation that, at some level, fails to meet the needs of a constituency. The constituency cannot be reached or satisfied because, in this case, too much reliance on social media created a theoretical nightmare in the form of a new but inappropriate law. The submission by the politician to the severity of social media and the perpetual nature of friending, posting, and updating creates a confusion of who the politician really works for and who the politician really represents. Social pressure is not absent in social media, and while the virtual aspect of social media is romantic and lofty, that is not to assume that the motives of users are as well.

Social media aids in the goal of citizen participation. It aids the representative in knowing within seconds the immediate opinions of constituents. In this way, citizens reduce the distraction that status has on disconnecting citizens from policy creation. Rich or poor can view Webinars, and rich or poor can tweet their opinions about policy. Automation produces a level of equality, and social media harnesses those automation gains in one place to be used for virtual social gathering. This is not to say that self-interest does not enter into the debate, into the tweet, or into the Facebook post. This happens all of the time no matter the venue used. What social media does is allow individuals in relative anonymity to voice their disapproval and state the disadvantages self-interest has on the issue. Not surprisingly, constituents of representatives have voiced their disapproval at instances of self-interest that

their representatives have introduced, including meaningless photo ops updated for no real reason besides self-interest. Politicians can assess the limits of their self-interests in the arena of social media and get the quickest response from their constituents than previously waiting for letters or e-mails expressing disapproval.

When social media assists in highlighting popular and unpopular policy, the concept of effectiveness becomes harder to achieve and define. What social media allows for in the grouping of people around an idea, it disallows in common measures of effectiveness, making reporting difficult and challenging, to say the least. With an expanded constituency, the politician cannot rely on the usual measurements. With an expanded constituency, one can only guess if support for a particular policy under certain conditions will be perceived as a failure by the members of the expanded constituency.

Webinars that tout the good things the politician or representative has accomplished is one way. Moreover, the real constituents that are mixed in with the expanded constituency also use different measures to determine a politician's effectiveness due to their exposure to social media. Social media will assist in regulating the effectiveness of a policy or the services a politician provides by presenting the results to the group and feedback on those results regarding what could have been done better in order to increase the output for the constituency group. In this case, social media serves as a constant check on policy from policy creation to policy implementation. A representative faces the added pressure of external voices making noise in social media sites about policy implementation errors they heard about on Facebook or Twitter. While this external group is not affected by the errors within their own lives beyond hearing about it on social media sites, they still wield great influence and, many times, are able to manipulate representatives and politicians that they neither know nor vote for. It is often unfair that these representatives have to adjust to constituencies they do not represent and may not be able to see.

Another way that representatives and politicians use social media is through fund-raising. An advertisement on a social media site like YouTube can run through the life of a campaign and

generate funds from constituents as well as well-wishers and supporters. In the past few years, a YouTube search for, say, "Redemption Song" by Bob Marley may very well be preceded by a video ad for a congressional or presidential candidate. These ads come armed with easy ways to send donations for the candidate by PayPal or credit card on a protected (https) Web site.

The cost of the campaign ad or video may be significant, but what it can do that other ads may not be able to do is basically cover most areas or Web sites people visit regularly, thus giving it greater visibility. Campaign signs in yards and on highways have diminished over the years and are mostly seen in high-traffic areas where constituents may drive or at televised conventions that constituents may watch. Where else may a constituent receive information? The Internet, of course—not just any area on the Internet but those areas like YouTube, Wikipedia, Twitter, Facebook, and LinkedIn—in other words, in virtual high-traffic areas. Placing ads in these areas will get noticed and may even be commented on by a spontaneous group in one of the social media sites discussing and examining the language, target audience, or color scheme.

Conclusion

For some time to come, social media will struggle to present a common core of characteristics from specific groups for effective narratives. In this case, redefinition and redesign will work in harmony with developments in social media. Hopefully, constituencies will move in tandem as well, and representatives will figure out how to effectively reach them. A representative using social media to communicate using cost-effective means continues the economic goals of revenue reallocation. Social media does not limit this practice, and in the future, the structures now being developed will deliver even more cost-effective methods and approaches for constituency services. Representatives should not feel threatened by the changes coming as fast as the speed of light as they relate to social media but should notice how social media is yet another opportunity to lessen the gap between people and institutions. The former mode of communication and service delivery is unsustainable in the current environment. Social media has moved policy creation and

policy implementation into the living rooms of every local and international constituency.

Content Communities

One of the driving forces behind the acceptance and rise of social media are content communities. These are sites that allow users to upload and share various kinds of media. Content communities exist for various reasons; some are cooperatives for developing open source software, others are used to display and distribute original art, and still others are just to share interesting links and Web sites. Of course, the use of these content communities often goes beyond just sharing and takes on political dimensions. According to Alexa.com, two of the 10 most-visited sites in the world are content communities: YouTube and Wikipedia.

Content community sites are typically populated by user-generated content. Users are generally required to set up accounts and thereafter can begin uploading and sharing their own content. These communities house a wide variety of content, including software, videos, visual art, and of course, textual documents. The goals of content communities are quite varied. Some communities,

like YouTube and Pinterest, were created to share original content of a wide nature. Other communities have a more defined purpose, as in the case of Wikipedia, which is an open source encyclopedia consisting of entries written and edited by users.

As in any network, the larger a network, the more benefits there are to all members. This understanding drives many participants to remain responsible and active participants in their chosen content communities. There are various reasons why people participate in content communities, even ones like Wikipedia where there is no recognition for individual contributors. Some of the reasons for participation include creative expression, connecting with people with similar interests, and sharing personal opinions.

Both individuals and organizations have been quick to grasp the potential for political impact through these content communities. Individuals use these communities to express and aggregate political opinions. Politicians and political parties also strive to create and maintain a presence on some of the most popular sites such as YouTube, Tumblr, and Pinterest. Nonprofits and activist groups also have been quick to tap into the power of these communities, especially as they offer low-cost avenues to reach large numbers of people.

Perhaps the most well-known and influential of all content communities is the site YouTube. In the sense that a picture is worth 1,000 words, YouTube often has been the source of groundbreaking videos. The popularity of the Web site lies not only in the great number of users but also in its innovative interface and ease of use. YouTube was one of the first Web sites to allow video content to be uploaded by users. More compelling was the fact that it offered an intuitive interface that anybody could use to convert and upload videos from a wide variety of sources. Nowadays, individuals can upload videos to YouTube directly from smartphones. In addition, there has been little or no censorship, although YouTube does have a set of basic guidelines, including a statement of what it considers to be unacceptable content. These features have allowed YouTube to outlast its competitors as well as become a force in global politics. The main ways people use this site are to (1) upload videos of events that are not being covered by media; (2) provide footage from

areas where the international press does not have access; and (3) act as a platform for politicians to air their views.

Other sites such as Tumblr and Pinterest are increasingly being used by citizens, politicians, and advocacy groups to voice their opinions and share messages. Both sites were extensively used by both the Republican and Democratic Party candidates in the 2012 elections.

In addition to providing public platforms for political ideas and opinions, another function that content communities are playing is that they are allowing audiences to bypass the agenda setting and framing functions of the mass media. Instead of relying on the mass media for an understanding of what is important news, audiences can now turn to Web sites such as Digg and StumbleUpon to collaborate with other users to define what is the most important and significant news for themselves.

ContractfromAmerica.org

ContractfromAmerica.org is a Web site devoted to promoting conservative, small-government ideals associated with the popular Tea Party movement. Ryan Heckler, a Tea Party activist from Houston, conceptualized the idea for the Web site, which served to collect the beliefs of Tea Party activists in order to create a document cataloging their most important principles. The Web site emphasizes the grassroots nature of the Tea Party movement because it solicited ideas from anyone who visited the site and then put them up for a vote to narrow down what these activists believe to be their most important values. The interactive nature of this Web site highlights the importance of social media as a democratic tool with the ability to bring together regular people from across the nation to express their specific beliefs to one another. However, critics of the Tea Party movement question the supposedly democratic nature of endeavors like the Contract from America Web site. They argue that, rather than being built from the bottom up, Tea Party activities are actually being directed by large, self-interested organizations.

The Contract From America Web site was introduced on September 1, 2009. Between this date and January 2010, the Web site reports that "hundreds of thousands of freedom-loving Americans" submitted their ideas for consideration. Then, "grassroots leaders across the nation" completed surveys that narrowed these ideas down to the 22 most important. Finally, individual Web site visitors further narrowed down these 22 ideas to 10 by voting. On April 15, 2010, as Tax Day Tea Party events were being held across the nation, the contract was revealed. In its final form, the contract highlighted three overarching principles: individual liberty, limited government, and economic freedom. Then, it listed the 10 voter-determined principles: protect

the Constitution; reject cap and trade; demand a balanced budget; enact fundamental tax reform; restore fiscal responsibility and constitutionally limited government in Washington; end runaway government spending; defund, repeal, and replace government-run health care; pass an all-of-the-above energy policy; stop the pork; and stop the tax hikes. Three hundred candidates and elected officials signed the document in order to show their support for these principles. Sixty-seven of the signers who were candidates in the 2010 midterm elections went on to win their elections, including Jim DeMint, Marco Rubio, Michele Bachmann, and Rand Paul.

While this Web site claims to have provided a grassroots experience, not all agree that this is the case. For instance, although the Web site claims to be a bottom-up call for ideas from nonpolitical conservatives, the Web site also advertises sponsorship from large organizations like FreedomWorks, Newt Gingrich's American Solutions for Winning the Future, and a Libertarian think tank named The Heartland Institute. Such organizations have been accused of astroturfing the Tea Party movement. In other words, critics of Web sites like ContractfromAmerica.org accuse these organizations of using their funds to manufacture the false appearance of the Tea Party as a grassroots movement that organically developed from people who wanted to work outside of the system. For instance, although the Web site visitors contributed their own ideas, Dick Armey, the chairman of FreedomWorks during the contract's development, also had a heavy hand in drafting the results. The Web site also explicitly thanks many of these organizations and describes them as invaluable to the process of creating the contract.

ContractfromAmerica.org was key in establishing concrete objectives for the Tea Party movement. If one wanted to run as a Tea Party-backed candidate in 2010, he or she established his or her loyalty to the movement by signing the contract associated with the Web site. The Web site continues to urge donations to support conservative candidates by allowing one to give money directly on ContractfromAmerica.org. The site keeps visitors updated on current issues of concern by publishing blog posts on its main page and also encourages them to stay connected to the site through other forms of social media by

including links to their Facebook pages and Twitter accounts. Despite its use of social media tools, the Web site and the Tea Party at large continue to receive the criticism that they are not really a bottom-up movement. These critics question how a Web site that relies on contributions and direction from already-established organizations can advertise itself as truly being a grassroots movement. This has larger implications for social media in general as it struggles between the need for organization and individual expression.

Cornyn, John

John Cornyn III is the senior U.S. senator from Texas and the current chair of the Republican National Senatorial Committee. He is also one of the first senators to adopt Facebook and Twitter and has pioneered the use of new social media and technologies in Congress.

John Cornyn was born into a military family in Houston, Texas, in 1952. He is the second of the three children of Dr. John and Gale Cornyn. He

U.S. Senator John Cornyn records selected passages of an 1844 letter from Republic of Texas President Sam Houston to former U.S. President Andrew Jackson. The senator's July 2012 recording was part of the Texas State Library and Archives Commissions Voices of Texas History project.

graduated from high school while his family was living in Japan, earning his varsity athletic letters in wrestling and track and field. After attending Trinity University in San Antonio, majoring in journalism, Cornyn went into real estate. The mid-1970s national recession caused him to rethink his plans and attend St. Mary's School of Law, also in San Antonio, where he served as president of the student bar association and as an editor on the law journal.

Political Career

Cornyn ran a successful private law practice when local Republican leaders approached him to run for state district court judge in San Antonio. He won election to this partisan office in 1985. Governor Bill Clements, the first Republican governor in Texas since Reconstruction, appointed Cornyn the presiding judge overseeing judicial administration in 22 south Texas counties. This was an unusual promotion for so new a trial court judge.

On December 6, 1987, CBS's *60 Minutes* television news program featured a story about the Texas Supreme Court titled "Is Justice for Sale?" The program uncovered evidence implicating two

members of the Texas State Supreme Court in a scandal tying campaign contributions to court decisions. Cornyn decided to run for the court in 1990. His campaign stressed judicial integrity. He earned a master's of law degree from the University of Virginia during his eight years on the court.

A later series of scandals, in this case involving then-Texas Attorney General Dan Morales's ties to five lawyers who had successfully sued the tobacco industry, forced Morales's resignation. Morales was convicted and sentenced to prison for falsifying documents in order to secure part of the tobacco settlement money.

Cornyn ran successfully for this office, becoming Texas's first Republican attorney general since Reconstruction. The Texas attorney general is the state's chief law enforcement official. He or she is responsible for a variety of duties including enforcing child support decisions, consumer protection, and some criminal prosecutions. The attorney general is also the official legal representative for more than 300 state agencies.

Attorney General Cornyn focused on cyberbullying, cybersexual predators, and identity theft during his three years in office. He established the Texas Internet Bureau, a state agency charged with investigating the illegal use of the Internet. Cornyn's crusade against these Internet crimes would continue once he was elected to the U.S. Senate.

Career in the Senate

Cornyn was first elected to the U.S. Senate in 2002. He became only the fourth Republican to represent Texas in the Senate since the late 1800s. Senator Cornyn secured appointment to three of the Senate's most prestigious and powerful committees: the Armed Services, the Judiciary, and the Budget Committees. He continues to serve on these committees and the Senate Finance Committee, perhaps the most powerful committee in the Senate. He easily won re-election to the Senate in 2008.

Cornyn's legislative agenda has been to support transparency in government, a balanced budget amendment to the U.S. Constitution, and the promotion of high-technology industries in the United States. He is the member of several Senate caucuses such as the Senate Republican High Tech Task Force and is chair of the Senate Radio Frequency Identification (RFID) Caucus.

Continuing his crusade against cyber child pornography, Senator Cornyn joined his successor, Texas Attorney General Greg Abbott, in an effort to pass legislation at the national and state levels to prosecute cyber child pornographers. He sponsored the Stopping Adults Facilitating the Exploitation of Today's Youth (SAFETY) Act of 2009, which would make facilitation of online child pornography by either the content provider or the Internet or e-mail provider a federal crime. It also increased penalties for sexually exploiting a child. The senator's concerns about "murderabilia," goods federal or state prison inmates sell over the Internet that are associated with their crimes, caused Cornyn to introduce the Stop the Sale of Murderabilia to Protect the Dignity of Crime Victims Act of 2007.

Cornyn opposed the Stop Online Piracy Act of 2011, one of several attempts to punish online theft of intellectual property. While acknowledging that such piracy was theft, he was concerned that the bill would chill the freedom of speech.

Cornyn's Senate voting record demonstrates both his willingness to work with members from the other party and his dedication to Republican values. He voted for the Bush administration's Economic Stabilization Act of 2008 and the Obama administration's economic stimulus act in 2009. Senators Cornyn and Patrick Leahy (D-VT) were jointly awarded the Bi-Partisan Leadership Award in 2005 by the Project on Government Oversight. This private watchdog organization celebrated the two senators' efforts to prevent exceptions to the Freedom of Information Act from being buried in legislation.

On the other hand, Cornyn opposed Democratic proposals such as President Barack Obama's health care proposal. He threatened to force the Senate to vote on the nomination of Priscilla Owens to the U.S. Fifth Circuit Court of Appeals in 2005 by challenging the constitutionality of a Democratic filibuster. Democratic senators had prevented 10 federal court nominations by President George W. Bush from coming to a vote on the floor. Cornyn's threat prompted seven Republican and seven Democratic senators to agree not to filibuster any nominees unless there was an extraordinary reason, avoiding what could have been a dramatic challenge to the Senate's unlimited debate rule. According to the Web

site OpenCongress, Cornyn ranked 11th among the 47 Senate Republicans in consistently voting with other Republicans during 2011 and 2012.

Cornyn rose to be the vice chair of the Senate Republican Conference in 2006 and became the chair of the National Republican Senatorial Committee (NRSC) in 2006. The NRSC is responsible for identifying, recruiting, and providing financial and other support for Republican candidates for the U.S. Senate. Cornyn was unanimously reelected to the chairmanship in 2012.

Pioneering Social Media in the Senate

Cornyn was elected to the Senate before the rise of social media and networking. Facebook, for example, did not debut until 2004. He has become, however, one of the most fervent champions of these new technologies in today's Senate. He was an early adopter of social networking, and he helped orchestrate the Republican gains in the Senate during the 2010 congressional campaign through traditional and social media techniques.

Cornyn's Facebook page became active in 2008. He has more than 27,000 "likes" on his Facebook page and close to 42,000 Twitter followers, making him one of the most popular politicians in social media. In 2012, Cornyn had more Facebook "likes," more tweets, and the second-largest number of subscribers to his YouTube channel, trailing only Congressman Ron Paul (R-TX). He averages 10 posts per day on both his Facebook and Twitter accounts. Unlike letters, phone calls, and e-mails that are filtered by his staff, constituents can contact Cornyn directly through his Facebook and Twitter accounts.

Cornyn's Senate office possesses one of the most effective social media operations in Congress. The senator was the first Republican senator and one of the first elected officials of either party to participate in a live town hall meeting on Facebook. Facebook invited Cornyn to participate in a discussion about the ways in which social media connect constituents with their representatives in Congress.

Cornyn has urged other Republican senators to use social media and social networking not only as ways to campaign but also as ways to engage their constituents and to communicate directly with the public. Every Republican senator now has a paid social media expert on staff. Forty-one

of the 47 Republicans in the Senate in 2012 regularly tweet.

Cornyn represents the second-most populous state in the union, a state of enormous racial, linguistic, and cultural diversity. Senators like him may be prompted to adopt innovative technologies such as Facebook and Twitter to reach out to this broad constituency, a problem the House of Representative members who represent more homogenous districts may not face. At the time of this writing in 2012, there are important differences in senatorial usage of social media, however. Republican senators had an 11-point advantage over Democrats in Twitter usage. Both Republican and Democratic senators were more likely to adopt Twitter than their party colleagues in the House.

Social media does offer new versions of old campaign tactics. Ads on YouTube and on campaign Web sites have made virtual campaigns faster and cheaper. Rapid-response tweets, texts, and e-mails can challenge alleged misstatements or point out gaffes committed by political opponents. Social networking sites can link friends to common campaign Web sites so that they can make political contributions. An effective ad can go viral on YouTube, gathering thousands of viewers in a few hours. As chairman of the NRSC, Cornyn is especially proud of committee's spoof of President Barack Obama's announcement to run for re-election. The spoof drew more YouTube viewers than did the president's actual announcement. Even online virtual worlds such as Second Life have been enlisted to promote candidates and policies. Second Life participants have used their digital personas, called avatars, to press political causes and beliefs through Second Life's electronic community.

Members of Congress regularly use Twitter to report on their daily activities, to link to news articles about themselves, and to engage in other self-promotional activities. They use Twitter as a new medium to share information that they already share through mediated media such as television, the printed press, radio, and directed communications including postal letters, pamphlets, e-mail, Web sites, and public appearances. YouTube's CitizenTube reported that almost 90 percent of Republican and 75 percent of Democratic House members of Congress had their own

YouTube channels to communicate with constituents in 2010. Republican channels drew far more viewers than did Democratic channels.

Conclusion

There are dangers in overestimating social media and networking impact on members of Congress. While 89 percent of members of Congress were on Facebook and Twitter in 2012, compared to only 20 percent in 2009, few do more than use social media to push their talking points. Congressional staffers surveyed by the Congressional Management Foundation thought that constituent visits to the home and Washington offices have more influence on members than any interest group or other form of contact. E-mail and postal mail had equal impact. The use of social media and networking to generate enthusiasm among supporters, raise money, and communicate ideas has not replaced traditional ways of getting out the vote, but their importance is growing.

While the new social media outlets are assuming the roles once fulfilled by traditional print and televised news organizations, they are not replacing traditional forms of politicking, such as hand shaking, baby kissing, marching in parades, speaking at luncheons, attending town halls, or receiving and sending personal notes to followers. But social media extends and multiplies the impact of other congressional actions. The floor speech, once confined to the printed page of the *Congressional Record*, the official published journal of the House and the Senate, or to the broadcast of C-SPAN, is now often replayed on a member's Facebook, YouTube, or linked Twitter sites, giving the member far more exposure than before.

It is unclear how much John Cornyn's leadership on social media and networking has affected the Senate and American politics. He has demonstrated to his Senate colleagues the new technologies' potential. But, social media is only part of a system of complementary and conflicting pressures on senators and their followers.

Corporate Social Responsibility

Corporate social responsibility (CSR) is understood in many ways. According to some approaches, CSR is connected with economic development and providing help for those in need. For some people CSR is linked mainly with ecological issues and protecting flora and fauna, stressing its focus on nature. For others, CSR is related to creating company image in the eyes of stakeholders, and it involves the implementation of public relations knowledge and methods. In most definitions, CSR is understood through the prism of meeting the interests and needs of broadly understood stakeholders, taking into account the environment they are part of and simultaneously aiming at achieving profits. In other words, CSR-oriented companies want to find the balance between people, planet, and profit. Moreover, the scope of interest also varies across CSR definitions by taking into account geographical factors.

For some specialists, CSR is connected with taking care of the local community and local environment, whereas others draw one's attention to the panlocal or even global scope of CSR activities. There are various approaches to CSR itself, stressing its legal, social, or economic character. CSR can be also more communication-oriented and focus on proper relations with stakeholders or, in other words, with the corporate environment and sustainable development of the company itself. This approach also covers the linguistic layer of communication, concentrating on the role of selected language devices and their roles in increasing or decreasing the effectiveness of CSR communication. Apart from the mentioned term, the following concepts are also used in the discussion of CSR: corporate citizenship, strategic philanthropy, corporate social responsiveness, latterly good governance, environmentalism and corporate sustainability. Other terms that encompass the CSR ideas concentrate more on the image of the company (e.g., business reputation, company identity).

Although the first ideas resembling CSR can be traced back to ancient times, it is the 21st century that has witnessed the rapid development of this domain. There are various reasons for the popularity of CSR in the performance of modern organizations. One of them is the growing competition between companies and other legal entities to attract the attention of stakeholders. Very often, the organizations offer similar products or services, and the social aspect of their activities must be stressed to make people interested in them. Moreover, the issue of network society, with lattices and grids underlying the relations between people and organizations, is important in shaping the interdependencies at both the individual and group levels.

Narrowing this issue to the topic of CSR, the activities of individuals determine organizations and vice versa. The other notion is the abundance of risks that many organizations are exposed to—economic, political, and social types. The same situation concerns individuals who seek companies that pay attention not only to the business activity itself but also to other factors determining the life of stakeholders at the micro- and macro-levels. The other reason for the popularity of CSR nowadays is the development of technology and

communication possibilities that determine the information flow between individuals and organizations. Moreover, the appearance of social media can be said to stimulate interest in CSR. Because individuals not only have immediate access to information related to organizational performance, but they also can participate in the discussion on a company's successes and failures, organizational communicators must provide possibilities for free and efficient discussion. The shift from passive observers to active creators of public discussion that describe the positions of modern stakeholders in the social media has also stimulated the interest of organizations in promoting CSR issues. Although CSR is becoming more and more popular in the performance of modern companies, in many organizations such policies are used only when some failures appear as the instrument of crisis management. CSR should be the focus of organizations not only in the moments of change, when maintaining the interest of stakeholders is crucial, but also on an everyday basis, and to be effective it should constitute the core of standard organizational activities. The other reasons for the popularity of online communication in organizational communication are its potential large scope and low cost.

As far as strategies of CSR communication are concerned, the following types can be enumerated: informing strategy, interacting strategy, and process strategy. The informing strategy involves a one-way communication process and covers aspects that should be communicated to broadly understood stakeholders. The interaction strategy, on the other hand, involves a two-way communicative process. Thus, it relies on stakeholders' active participation and better perceptions of stakeholders' needs and expectations. The process of going from one strategy to another is linked with effective strategic management.

Corporate Social Responsibility and Social Media

With the increasing role of social media in people's lives, it is not surprising that they also determine CSR. The popularity of social media in communicating CSR is determined by the following reasons: Due to the popularity of social media, organizations are given the chance to communicate with a vast number of stakeholders at any time it

is required. The other reasons for its popularity in organizations are its large scope and low cost. It also should be stated that virtual contact is relatively cheap in comparison with standard methods of interaction. In the traditional mode of communication, it is the organization that controls the information flow and has to bear, in most cases, the costs related to meetings, telephone calls, and correspondence. Online interaction does not offer the company the position of the main content creator, but it allows the organization to conduct communication quickly and cheaply. It should also be remembered that social media do not only enhance the communication between organizations and their stakeholders, but they can also influence the image of the company in a negative way by disclosing information about corporate failures and irresponsible behavior very quickly.

Openness and honesty are crucial as companies cannot hide certain facts. Moreover, the stakeholders can participate in CSR discourse on organizations without the participation of the organization itself because social media facilitate communication at both intergroup and intragroup levels of organization. Thus, the way communication is handled has also changed. Modern CSR communication involving social media should concentrate on helping stakeholders in CSR issues and enhancing their participation in CSR dialogue. However, the organizations that opt for social media communication should remember to update them constantly.

There should be people in the organization selected for reading the posts and responding to the questions on a daily basis. Another important notion related to CSR communication in online settings is the respect for all participants. All stakeholders should be treated in the same way, having equal rights to participate in the ongoing discussion. Moreover, the organization should select linguistic tools that will be understood by all participants. One option is to select metaphors that rely on well-known domains in disseminating knowledge on CSR issues. Another important issue is the language level of communication itself, represented, for example, in respecting the linguistic identity of the online users who should have the option to read information in their native tongues. In the case of international companies, it is often required to run Web sites and social

media tools in many languages to meet the linguistic needs of stakeholders.

Social media often lead to the creation of online social networks that are unregulated, and they stimulate effective discussion among participants and knowledge exchange in related settings. There are also various reasons why online social networks are popular among users. First of all, they do not demand regular contact because a person can decide when he or she wants to enter the network. The mentioned freedom is especially visible in asynchronous online networks; people may enter the social media when it is needed and comfortable for them. There are no restrictions as far as the timing for joining the discussion is concerned because they do not have to respond immediately, but they have time to search for data and post comments.

This is especially important for those who are not fluent in the language used in the information flow as they can check the words or phrases they do not understand. These features are important in the discussion of CSR because the participants are given time to provide answers and, what is more, they can discuss CSR themes when it is convenient for them. Taking into account the diffusion of information in online media, the social networks in virtual settings can be discussed by using the terms *homophily* and *heterophily*. Homophilous online networks encompass individuals sharing certain features or attitudes in common. Consequently, the participants using social media can have similar ages, educations, professions, and attitudes to technology.

In this case, individuals select the networks because of user similarity. Moreover, homophily in online media is often related to similar backgrounds, genders, hobbies, or localities. Both individuals and organizations involved in the CSR discourse rely on common features in conducting effective dialogues. Thus, knowledge creation and dissemination take place among similar individuals or entities.

The contradictory type of network is called a heterophilous online network. Heterophilous online networks rely on users who have different backgrounds, knowledge, skills, or positions in the group or community. Thus, people rely on these networks if they want to obtain data they do not possess or if they want to discuss some

CSR aspects with specialists with different backgrounds and diversified knowledge. This type of online network may stimulate the discussion of CSR among people of diversified backgrounds and, consequently, show future paths of interest, investigation, and implementation. Social media can also restrict the access to information on CSR. Moreover, some individuals may prefer standard forms of communicating CSR issues because there can be stakeholders not familiar with the Internet and its online tools. Thus, the role of an organization is to take into account different communicative needs of stakeholders to allow them the possibility to express their views in the way they want and are able.

However, it should be stated that, in many cases, social media seem to be more effective than the standard forms of communicating CSR. First, people do not have to disclose their true identities. In this case, they are more likely to share their doubts, comments, and even criticism as they can express them anonymously. Second, social media offer tools that can be used only temporarily or as an addition to the regular Web site. The example can be darksites that are created in a moment of crisis to deal with novel and unexpected negative instances. To add, hatesites can be created by those not satisfied with the performance (also in the ethical sense) of the organization.

Another form of CSR communication is a blog, or an Internet diary of the CSR stakeholder. Apart from personal comments and ideas, the blogger can provide links to sources of information on CSR as well as offer some discussion between his or her posts. Facebook is another popular form of CSR social media communication. According to various studies, the popularity of Facebook is very high, as high as 90 percent in the United States. This tool offers immediate posting that is important in CSR discussion of novel or sudden issues. Many CSR stakeholders also tweet and post their comments and suggestions regarding sustainable responsibility on Twitter.

Corporate Social Responsibility and Politics

The relationship between CSR and politics is related to corporate performance. The growing role of politics in modern organizations is also

connected with the change of companies' position in the modern reality. The shift from passive receivers to active creators of activity, especially in the sphere of citizenship rights and public goods, has resulted in more company responsibility toward people and the environment. Because companies do not exist in a vacuum, even the stakeholders not directly involved in CSR policy are influenced by CSR statements. For example, the owners of small firms have to observe the changes taking place in other organizations and respond to them in the way they run their companies. Moreover, the political situation in a country shapes the CSR policies of companies.

For example, economic crisis often leads to reducing staff, lowering salaries, or cutting additional benefits in companies. Moreover, politics shapes the relation between governments and organizations and also determines the role of stakeholders in community life. Companies interested in following CSR policies impose some rules or regulations before they are introduced by governments. Additionally, if a government does not obey regulations regarding safety at work, environmental policies, and so on, companies may not observe them either. Thus, politics is often mirrored in company performance.

Taking the regional dimension of a companies' performance, the issue of politics should be taken into account by companies when they want to adapt to local conditions. There are various ways the notion of CSR and politics is researched in modern literature. One of the possibilities is to show how the political power present in a given territory enhances or hinders the interest of stakeholders in CSR policies. One such study was conducted to determine the relation between CSR and political beliefs in the United States and how the popularity of one party in given states shapes CSR attitudes. It should also be stated that the attitude to CSR in companies depends on the type of political system. For example, in market socialism, the boundary between business and politics is not strict, and companies participate in distributive equity. In a property-owning democracy, there are institutional mechanisms eliminating the excessiveness of economic power in politics. In welfare-state capitalism, it is important to eliminate power imbalances in business and public domains. In liberal equality, the imbalances in

economic life determine the political sphere. In classical liberalism, there is the need to set boundaries between business and politics. In libertarian laissez-faire, the boundaries between politics and business are completely unfixed. There are no coercive systems that aim at controlling socioeconomic imbalances and their subsequent presence as political inequalities.

Corporate Social Responsibility, Politics, and Social Media

The relation between CSR, politics, and social media is represented in many ways. First, the topic of organizational performance, including its CSR communication in online settings, is a topic of interest for those directly or not directly involved in politics. Both politicians and broadly understood stakeholders are interested in how the company deals with CSR issues and how its attitude determines politics on a more macro scale. As social media constitute an important tool in the dialogue between individuals and politicians, CSR is also a topic of discussion among interested parties.

Modern organizations use online communication tools to present their CSR policies and strategies, taking into account the political grounding of CSR parties. Moreover, taking into account the speed of information creation and publication in the case of social media, with tools such as social networking sites, blogs, content communities, and virtual worlds, companies can respond very quickly to the changing political reality and adjust their CSR policies to meet the needs of broadly understood stakeholders. Taking political actors into consideration, social media foster their discussions with the public, allow them to notice reactions to their policies very quickly, as well as answer questions.

It should be mentioned, however, that the power of social media also demands constant updates of these communication tools because online communication requires the online participation of all involved interlocutors. Moreover, in the case of politics, there exists the possibility of contradictory opinions and ideas as people show interest in various political parties. Consequently, the online social media focused on discussing CSR issues from the political perspective should respect the rules of free discussion and

respect all participating users, regardless of their political beliefs.

Countries Banning Social Media for Political Reasons

China, Egypt, Iran, North Korea, Saudi Arabia, Syria: this is just a partial list of countries that have banned or restricted access to the Internet and social media for political reasons. The list, however, is always changing as some countries utilize temporary bans on certain sites while others permanently restrict access to all social media that is not government controlled. But why would countries want to restrict their citizens' access to the wealth of information available on the Internet? The answer to this question is complex and involves issues of culture, economics, and politics.

Antonio Gramsci's theory of hegemony illustrates the concept that the dominant or ruling group must control access to cultural information and ideology by subordinate groups in order to stay in power. Such control allows these ideological views to be accepted without hesitation or challenge. They become an accepted status quo. While the threat or reality of coercion is one way in which this can occur, more often than not continued domination is done through the careful control of processes related to human agency, ideological consensus, and economic domination. Advertising, public relations, and mass media are all key tools for ideological control. Social media, however, makes such control far more difficult, especially in times of rising political and economic strife, because it is challenging for a government or dominant entity to control the information being disseminated via the Internet.

Before looking at the current state of social media restrictions and censorship, it is important to discuss the roles media and journalism have historically played in propaganda. There is a prevailing belief that all conflicts are fought on two

fronts: the battlefield and the minds of the populace. The result has been the increasingly organized use of propaganda not just during times of war, but whenever there is a cause that needs to be advanced. In times of war, the military prizes the value of controlling information and the media, because there is concern that if journalists are given unrestricted access to an area of conflict they will report stories that could either endanger lives or that could be negative to the dominant group. If either of these two occurs there could be a negative impact on public opinion, which might then call into question the reality created by the dominant group and threaten the continuation of the status quo.

Ways of controlling the media by the military or other dominant groups have differed greatly over time, ranging from embedded journalists, planting stories, controlled daily briefings, and outright bans. Before the 20th century, information about battles came from field officers and were not impartial reports, but government propaganda. This led in World War I and II to government-created agencies that worked to steer journalists away from areas that showed destruction and human devastation. Journalists have also been asked to not show certain images or videos if they are perceived to be a threat to the stability of public opinion. Such maneuvering strategies were designed to increase a sense of distance between the public at home and the battlefield. As the Vietnam War suggests, uncensored coverage of a conflict can lead to significant antiwar sentiment. In Vietnam, the government's attempt to control information given to journalists backfired as the media, especially television, decided that they were not satisfied with reporting distorted facts. The result was a shift in media coverage to the antiwar protests at home, which gave these movements greater visibility and credibility.

Control of parachute journalists, journalists sent to cover a conflict but who have little knowledge of the region or terrain, is relatively straightforward in times of war. While such control is a threat to freedom of speech and the ability of the media to expose corruption, the need for the media to work cooperatively with the government in order to have access to information allows the military to encourage a certain level of journalistic self-censorship. Citizen journalists who report

When the Turkish Information and Communication Technologies Authority introduced filters that Turkish Internet users would have to choose from before browsing the Internet, thousands of Turks gathered in some 40 cities and towns around the country on May 15, 2011, to join marches organized on Facebook against state Internet censorship.

through social media are outside of that system, and their stories can effectively remove the sense of distance between the public and the conflict. Their real-time images and stories make the conflict “real,” and the volume of voices lends legitimacy to the reports and carries the stories into the mainstream media, where they feed the demands of a 24-hour news cycle. The way to attempt control is through banning the technology citizens use to disseminate information. With social media it is also more difficult for those in power to hide when they are controlling the flow of information, and the control is more transparent to the outside world. In addition, there are often ways to work around the technological bans, thus resulting

in negative publicity to the group attempting to restrict access to social media without stopping the flow of information.

One downside of reporting through social media where fact is mixed with propaganda is that it is extremely difficult to tell what is the truth. As there are virtually no filters on who can post information or alter existing content, and social media activists may not subscribe to the same journalism ethics, social media users have to be diligent in their interpretation of what is fact versus fiction. But citizen journalists or activists are essential in bringing a conflict into the home, as they can go where mainstream journalists cannot, and they understand the culture and landscape far better, while not being limited by deadlines and corporate policy. In addition, social media allows those at home to become direct participants in the stories by responding with posts and tweets of their own. Social media posts also have the appearance of being genuine and not impacted by the government or corporations, which can give the stories and videos greater weight in the eyes of the readers. Perhaps most significantly, social media stories can go “viral” and spread around the world through reposts, links, and retweets.

Arab Spring

All of these factors are evident in the most recent examples of countries attempting to ban social media for political purposes. In spring 2011, social media chronicled the uprisings that have come to be referred to as the Arab Spring. Beginning in Tunisia and moving to Egypt, Syria, and other countries in the Middle East and north Africa, social media was used as an effective tool to mobilize protests and draw world attention. During the revolutions, the governments attempted to shut down the Internet in order to hinder the ability of protesters to organize and disseminate information.

The most significant impact of the Internet ban was the inability of protesters to use social media as a call for help. During the ban, protesters resorted to old-fashioned methods of communication, such as holding handmade signs with instructions for where to meet, or they found ways around the Internet blocks. Speak2Tweet was developed by Google, Twitter, and SayNow during the Egyptian uprising to allow anyone

to call an international phone number and have their message translated into a tweet. By the time the bans occurred, the uprisings had already gathered considerable strength and repressing speech on social media had limited impact; the bans were thus short-lived.

Effects of Bans

Outside of China, which will be discussed below, the greatest restrictions on social media occur in the Middle East and north Africa, especially in countries that are predominately Muslim and/or countries that are communist or have “representative democracies.” It is also common to see temporary bans on certain social media or Internet sites as permanent bans are extremely difficult to enforce. Iran has been engaged in Internet censorship since 2005; during the Arab Spring, it banned Google.

However, there are approximately 150,000 Iranian users of Facebook. Saudi Arabia, without explanation, banned access to Facebook in November 2010, but the ban was lifted shortly thereafter with no word as to why. The Saudi government has also threatened to ban Skype and other instant messaging applications. Bangladesh, in May 2010, attempted to ban access to Facebook after satirical images of Muhammad appeared on the site. The ban was not successful and lasted only a week. In Pakistan, there are continued attempts to ban information that is anti-Islamic or a threat to internal security. In Syria, citizens can be jailed for looking at political content on the Internet or using Twitter. Government permission is also required to create a Web site. Facebook and YouTube had been officially banned since 2007, but those restrictions were lifted in 2011.

Another challenge of banning social media is attempting to ban something that does not reside within the country. In April 2013, the Indian government came under fire for its possible attempt to regulate the Internet. But as the government indicated, it is difficult to create regulation when the servers do not reside within the country. Regulation is often tied to the location of the servers. And that is the problem that many countries face. Even countries that do ban social media cannot do so fully as the nature of technology is such that there are many ways around the bans.

China

China has had the most success in terms of restricting its citizens' access to social media even though it is a country with extremely high Internet use, with 540 million users. Strict restrictions were put in place in 2009 when Uighur activists attempted to use Facebook to organize independence protests in the Xinjiang region. There are still about 700,000 users of Facebook in China even though Facebook, Twitter, and YouTube are banned permanently, and others, such as LinkedIn or the application Dropbox, are banned occasionally. The Chinese government tries to direct its citizens to its Twitter-like weibos. While Chinese citizens do not have access to many foreign Web sites, including the *New York Times* and *Bloomberg*, foreign companies can request a presence on the weibos where they are subject to censorship by the government.

The Chinese government claims that the reason they have to restrict Internet access is to prevent rumors and stop the distribution of inappropriate material. However, Chinese citizens can purchase illegal drugs and firearms on Web sites that are not shut down by the government. It is evident that the government is concerned with the ability of its citizens to gain access to differing ideological perspectives on human rights, which create a direct threat to the stability of the government.

Circumventing Bans

For all of the attempted bans, there are even more ways for technologically savvy individuals to get around them. If there is any Internet access it is possible to go beyond a country's firewalls and access banned sites through virtual private networks or VPNs. VPNs also serve to keep the browser history of users private. In September 2012, the Chinese government took steps to restrict access to VPNs through new software, but this also limits the ability of foreign corporations to access their own internal networks. This could be a threat to the country's financial growth as VPNs allow foreign companies to prevent the government and other companies from seeing their communications while also providing transactional safeguards. These new regulations issued by the Standing Committee of the National People's Congress also require social media users to provide their real names to service providers,

while retaining their online pseudonyms. The regulations also place greater responsibility on service providers to delete forbidden posts and then report them to the government where violators could be jailed. The restrictions come after multiple sexual and financial scandals were exposed by Internet users, which resulted in the resignation or dismissal of 10 local government officials. The new regulations are the strongest to date in China and could be an indicator of more to come based on recent changes in leadership in the Communist Party.

Since the majority of social media users are young, the new restrictions could backfire on the Chinese government. As seen in the Arab Spring, it is the youth who are very familiar with social media who can mobilize a social movement or revolution. It is important to remember that it is people who drive protests through technology rather than technology driving the protests. Social media users have proven themselves to be extremely proficient in finding work-arounds to government Internet controls, which could serve as a threat to hegemonic control. That is exactly what governments fear, but the decision to ban social media rather than find a way to control its counterhegemonic messages is shortsighted. When people are prevented from getting what they want, even if it is access to YouTube, backlash often follows.

Crowdfunding

Crowdfunding, in contrast with the traditional fund-raising model of obtaining financial backing from a few large investors, is fund-raising by collecting a large number of small donations. While not unique to the Internet era, the method has been transformed by the possibility of using Web-based services to reach out to potential small funders, including through e-mail solicitation, dedicated software platforms, and Web site donation buttons. Crowdfunding is used to generate start-up or operating capital for a wide variety of enterprises ranging from art or commercial production to journalism, disaster relief, or political campaigns. While crowdfunding is important for the decentralization of project capitalization in general, it also occupies an interesting role in the modern debate over campaign finance. Crowdfunding as a campaign fund-raising technique received a jumpstart in 1999, when the Federal Election Commission ruled that online credit card donations were eligible for matching federal funds.

Exploring the theoretical underpinnings of crowdfunding, legal scholar Yochai Benkler described how drastically lowered information costs are leading to a "networked information economy," in which large-scale cooperation replaces old market forms. In this new economic mode, "commons-based peer production" describes the process whereby large collections of individuals, motivated by social and individual impulses, collaborate on a common product. More normatively, Lawrence Lessig extended his own argument regarding the need to liberate media products to common public ownership in order to also embrace the benefits of political

crowdfunding. Lessig argues that large amounts of special-interest-group money have corrupted the American political system and claims that one solution would be to refund \$50 to all voters in order to allow them to use that money to serve as the sole source of campaign funding.

Both of these perspectives are rooted in the theory of self-organizing social structures, an organizational approach that received substantial attention at the turn of the 21st century. Howard Rheingold's identification of the smart-mob detailed the way that groups of individuals could physically self-organize—for protest, art, or entertainment—using mobile personal technology like short messaging service (SMS) messaging. The scholarly turn to lauding the self-organizing, information-generating capacity of leaderless crowds stands in rather stark contrast to the suspicion of mass behavior expressed by sociological scholars in the late 19th and early 20th centuries. Gustave Le Bon developed the concept of crowd psychology, identifying the fundamental expression of crowd-driven phenomena as irresponsibility and impetuosity. In a similar vein, Charles Mackay documented the tendency of crowd-sourced ideas to take on fantastical, delusionary dimensions that lead to concrete consequences like the creation of economic bubbles.

As the notion of crowdfunding is tied to the concept of collective investment rather than the purchase of a finished product, crowdfunders more closely occupy the position of shareholders or collaborators than customers. This notion of the crowdfunder as investor was given greater legitimacy in the United States by the April 2012 JOBS Act, a law that loosens requirements on small investors in start-up companies. Recent growth in crowdfunding volume is exponential: In 2012, crowdfunding research firm Massolution estimated \$2.8 billion would be raised through crowdfunding worldwide, up from \$1.47 billion in 2011 and \$854 million in 2010. Large platforms like Kickstarter (www.kickstarter.com) and Indiegogo (www.indiegogo.com) provided concrete examples of the model's success in a large variety of project areas, while platforms like Kiva (www.kiva.org) and the Lending Club (www.lendingclub.com) have popularized crowdfunding as an avenue for

providing both humanitarian microloans in the developing world and larger loans in developed nations.

While crowdfunding is now used more broadly, it has for decades been an aspect of state and national elections in the form of public financing. Public financing models require candidates who accept public financing to raise money in small increments from many donors in exchange for receiving matching public funds, which are also crowdsourced through a voluntary checkoff box on income tax forms.

Although Bill Bradley, Howard Dean, and John McCain have all used crowdfunding to support their respective bids for the White House, in 2008, Barack Obama was the first major-party presidential candidate since 1976 to reject public financing and turn to purely private financing, which he achieved in substantial part through small, Internet-based donations. Michael Malbin of the Campaign Finance Institute argues that Obama was able to do that because the 2004 election showed that the Internet could indeed effectively raise large sums through small donations. In this way, while Internet-enabled crowdfunding may not have eliminated the role of large donors in campaign financing; ironically, it may have helped render public financing obsolete.

Crowdsourcing

The term *crowdsourcing* is an amalgamation of the word *crowd*, those who participate in the activity, with the word *outsourcing*, a procurement practice and means to outsource an activity to the crowd, as defined by Jeff Howe in 2006. In this initial meaning, crowdsourcing refers the process of outsourcing a task (e.g., cocreation, user innovation, or repetitive, small tasks) to a group of individuals, the crowd, which can be nonexperts acting as volunteers or experts in that specific field.

Although crowdsourcing can occur in offline as well as in online environments, it is now seen mainly as an online activity. The problem to be addressed or the tasks to be developed are distributed to an unknown group of individuals. The contribution given by the crowd (e.g., solution of a problem, suggestion, or recommendation) is owned by the entity responsible for the call, the crowdsourcer. It is somehow related to the notion of the wisdom of the crowd, explored a few years before by James Surowiecki, with open source principles applied in the software industry as well. Compared to outsourcing, the main difference is the fact that, in this case, it is a well-defined and paid individual or entity that takes the task, while in crowdsourcing, the task is addressed by an undefined and usually large group of individuals, who often participate on a voluntary basis.

Since 2006, the term has been applied to describe many and diverse kinds of Internet-based, collaborative activities and seems to change every time new applications and tasks are outsourced to an undefined group of individuals. It has been used, for example, in knowledge production, in problem solving, in microtasks, in user studies, in software development, in different businesses activities, in content production (e.g., encyclopedias, photography, user-generated news sites, etc.), in the assessment of graphical perception and visualization design, in geographic data collection for disaster response, or in urban planning issues. In common seems to be the idea that a group of diverse individuals will produce more accurate decisions than individuals or even experts acting alone.

This dispersion in the use of the term *crowdsourcing* leads various authors to propose

different definitions for crowdsourcing, considering the particular issue he or she is addressing. Confronted with this diversity of meanings and definitions, Enrique Estellés-Arolas and Fernando González-Ladrón-de-Guevara proposed an integrated definition of crowdsourcing: Crowdsourcing is a type of participative, online activity in which an individual, an institution, a nonprofit organization, or a company proposes to a group of individuals of varying knowledge, heterogeneity, and number, via a flexible open call, the voluntary undertaking of a task.

The undertaking of the task, of variable complexity and modularity, and in which the crowd should participate bringing their work, money, knowledge and experience, always entails mutual benefit. The user will receive the satisfaction of a given type of need, be it economic, social recognition, self-esteem, or the development of individual skills, while the crowdsourcers will obtain and utilize to their advantage what the user has brought to the venture, whose form will depend on the type of activity undertaken.

With such a diverse range of applications, the strengths and weaknesses of crowdsourcing varies from case to case and depends on the role assigned to the crowd in each particular process. For the entity or person responsible for the call, crowdsourcing facilitates data collection and evaluation of specific issues, helps solve problems otherwise more difficult to address internally in the organization, is a cheaper and faster way to deliver some specific tasks, and avoids expensive or complex infrastructures. It can also make it easier to develop new products and services and to experiment and implement new ideas by accessing talent dispersed in the crowd, and it can generate better results.

Nonetheless, crowdsourcing is a process not exempt of difficulties and weaknesses, given the nature of the role played by the crowd. Crowdsourcing can be seen as an exploitation of unpaid labor (e.g., the unethical use of an unpaid or cheaper and socially unprotected labor force) and have a number of other limitations in part associated with issues of trust and reliability, along with the fact that it is difficult to apply in highly complex tasks.

Crowdsourcing may also produce faulty results as a consequence of the lack of statistical

representativeness of the crowd. This is in part a consequence of the fact that small but powerful groups of more active participants may easily misrepresent the crowd perspective, influencing the results toward the interests of specific social groups or individuals.

These circumstances challenge the widely held view about the representativeness and accurate decisions that crowdsourcing produces, an issue of particular relevance in crowdsourcing used within public policy decision-making processes, as is the case when it is applied to replace or to complement the formal practices of citizen participation in urban planning.

In part, this kind of risk can be minimized if new tools for transparency are used (e.g., if a summary of all user contributions is made public, which will easily reveal the existence of any social or geographic bias). The value and the material compensation for the work provided by the crowd and the ethical consequences of wages paid to the crowd are important social and ethical issues that anyone considering to apply crowdsourcing must consider, as well as those willing to take part in it.

As results from the above definitions, there are different types of crowdsourcing. It can be employed to accomplish a task, to find solutions for problems, and to gather information. It can be used to cast a vote on a particular issue, idea, or proposal; for creative work; and for raising funds for a specific initiative. In paid crowdsourcing, which is becoming increasingly common in for-profit activities, the crowd receives compensation for their participation in the process, while in nonpaid crowdsourcing, particularly suited for the accomplishment of public policy objectives, a variety of incentives can be used instead.

Crowdsourcing can be designed, after due consideration of its advantages and ethical limitations, for use in public policies. As Darin Brabham argues, the crowdsourcing model developed in the business field is an appropriate model for citizen participation in the urban planning process, not only to gather information but also to explore creative solutions for practical urban problems or for urban design proposals.

Cultivation

Cultivation is a prominent theory in mass communication research that describes a process whereby viewers' perception of the real world and the media world merge and blur together. This cultivation effect is the result of cumulative exposure to large amounts of media over long periods of time. Generally speaking, media do not directly shape viewers' opinions but rather provide perceived facts upon which viewers form opinions. These shifts are small but pervasive and impact the whole of viewers' worldviews.

Cultivation theory emerged from research started in the 1960s at the University of Pennsylvania by George Gerbner and the Cultural Indicators Project. Cultivation theory posits that heavy consumers of media (and television in particular) develop views of the world similar to what they see in the media. Cultivation theory argues that television is different and more powerful than earlier media for several reasons. Television distributes consistent audiovisual stories across demographics, providing audiences with a unified vision of the television world, despite the varying characteristics, backgrounds, and experiences of its viewers. This has a mainstreaming effect that homogenizes public opinion. Diverse publics become similar in outlook because they consume the same media messages over time. This has the overall tendency to maintain and propagate the status quo while reinforcing faith in dominant social and political powers.

Television is also a unique medium because many viewers receive very large amounts of exposure, often from very early ages. Because of this, television is understood to be a centralized system of storytelling that replaces prior institutions and individuals in socializing viewers from infancy on. The problem is that the symbolic televisual world may have very little in common with objective social reality.

Over the course of its history, cultivation has been particularly concerned with the impact of television violence because violence was determined to be the primary message of television narratives, both as fiction and news. Heavier viewers may suffer from what theorists call the Mean World Syndrome, whereby they judge the world to be more dangerous and individuals to be less

altruistic than they actually are. Resonance occurs when the everyday life experiences of viewers reflect or resemble these televised worlds. For instance, viewers who live in neighborhoods where violence is more common are likely to receive a double dose of the cultivation effect and have the violent worldview of television reinforced.

While violent content has been a source of particular interest, cultivation studies have also measured media's impact in other areas, including attitudes toward gender, ethnicity, age role, family, the environment, nutrition, politics, and science. In terms of political opinions, researchers have found that television's tendency is to socialize people into standard roles and behaviors and that heavy television viewing correlates to middle-of-the-road and mainstream political outlooks. Heavy viewers also reply to questions more readily than others, suggesting that there is a cognitive shortcut already in place and that their answers are less considered. Studies have also found that cultivation's effects may be moderated or strengthened by other variables including educational attainment, life experience, and whether television is viewed alone or with others.

Though cultivation was originally envisioned as relating primarily to television, subsequent studies have expanded it to include a variety of other media, including magazines, newspaper articles, video games, and online social networking. Some modern theorists have pointed out that the Internet, like television, represents an immersive media environment and that reality television in particular bears much in common with social networking platforms.

The cultivation approach to research distinguishes it from many other positivist traditions in communication. While traditional effects research focuses on the impact of specific media treatments and measurable effects, cultivation focuses on long-term socialization over time and across media. Because of this, cultivation researchers rarely use experimental methods that test the short-term effects of media exposure. Instead, cultivation research usually involves two methods: content analysis of media and surveys (primary and secondary) of viewers to assess exposure to television and perceptions of the world.

This shift in perspective from selective exposure to immersive experience of a medium over time

has sometimes been a challenge for cultivation's broader acceptance and has generated controversy within the media effects community. Critics have noted that cultivation theorists rarely differentiate between different kinds of programming and have questioned whether general exposure or exposure to genre-specific content are better predictors of effect. Critics have also claimed that cultivation theorists haven't thoroughly explained the cognitive processes behind television's impact on viewers. Cultivation's precise mechanisms of social change (including mainstreaming and resonance) are also difficult to test using traditional social scientific methods that would assess causality rather than merely correlation. But meta-analyses of the many cultivation studies published over more than three decades indicate that there is a small but reliable cultivation effect in heavy consumers of media. Cultivation theorists liken this to other systems such as climate change, financial markets, or elections, where a slight but pervasive shift in public opinion may have a system-wide effect.

Cyberculture

Historically, *cyberculture* is a term that is interrelated to a set of issues that can be characterized by ideological, technological, sociocultural, or social scientific theory and praxis. In contemporary terms, cyberculture is broadly used by media pundits and laypeople alike as a catchall phrase to capture the social norms of everyday technology users such as hackers or cyberpunks or various literary versions of techno-utopia motifs or themes. More specifically, despite the appearance of the term *cyberculture* during the 1960s and 1970s, it is generally understood as the mass human interface with digital technology

Kathrin Fricke, known by her online persona of Coldmirror, signs autographs at the Gamescom 2012 convention in Cologne, Germany. Coldmirror operates one of the most popular German YouTube channels, and publishes blog and vlog entries. The ability for Internet bloggers and video posters to become celebrities is part of recent cyberculture.

that began in the 1990s. Therefore, despite the existence of the term *cyberculture* for over a generation, it is only recently, since the emergence of cyberculture studies, that an investigation of its impact in relation to humans has occurred. However, at a historical minimum, it is important to note the historical beginnings of cyberculture, its manifestations, and how the concept of identity is reflected in relation to the digital sphere.

Historical Beginnings

Computers had been developed in the 1950s; however, the appearance of personal computers in the 1970s would transform work and leisure via communication technologies and the subsequent manufacturing and globalization of those technologies. For example, by the 1980s, people could utilize their personal computers to communicate in what came to be referred to as cyberspace. The term *cyberspace* became popular following the publication of William Gibson's book *Neuromancer* in 1984, which described an existence where the human body is left behind and cognition is transformed and exists in a virtual realm. However, it may be more appropriate to describe the physical construct of cyberspace as a term used to describe an aggregate of electronic digital technology that enables individuals to communicate in different formats. The specific technology that allows individuals to communicate was based upon military technology of the 1960s, referred to as Advanced Research Projects Agency Network (ARPANET), which was developed to enable American communication networks to survive a nuclear attack. However, cyberspace is where the social interaction of cyberculture via communication, work, entertainment, and business takes place and is embedded with other physical and social spaces.

Manifestations

There are several manifestations of cyberculture including, but not limited to, social network sites (SNSs), online gaming, blogs, e-commerce, file sharing, chat, and other forms of communication. Currently, within this context, these manifestations of cyberculture have influenced new forms and patterns of consumption, habits, and techniques of knowledge acquisition and exchange. In fact, it may be argued that, by 2013, virtually

every aspect of personal and institutional life in the physical world has developed its counterpart in cyberspace.

For example, since the emergence of e-commerce sites like Amazon and the online auction site eBay, more and more consumers make online purchases instead of traveling in person to traditional brick-and-mortar business locations. Second, social network sites like Facebook, BlackPlanet, Twitter, and Myspace collectively have hundreds of millions of members and influence the outcomes of elections and social movements. Third, influential blogs and online news sites are rapidly displacing traditional news outlets as primary sources of information for media consumers. Fourth, more relationships are now being formed through online dating sites like E-harmony or Match.com than through traditional social locations such as church. Finally, online sites such as Wikipedia and/or search engines like Google have rapidly influenced the acquisition and exchange of information, and the confluence of these and aforementioned manifestations of cyberculture have had tremendous implications for the previous conceptualizations of culture and community in relation to identity.

Identity

The Internet, its sociophysical construct cyberspace, and its cultural construct cyberculture offer their participants an instant ability to communicate within and across borders and over previously inaccessible distances. Thus, participants are creating imagined communities where individuals can participate and form various types of relationships whether real, virtual, or simulated that reconfigure previous human limitations. However, in relation to identity, some important considerations regarding cyberculture are ethics and the nexus between informational and communication technologies (ICTs) and community formation.

In regards to ethics, previous scholarship done by Lisa Nakamura explored race and cyberculture via the tension between previous conventions of a unitary identity that was influenced by a certain set of stereotypes, laws, and social hierarchies. Furthermore, these practices operated with a cultural hegemony or dominance that served the interests of powerful interests vis-à-vis

the more collaborative approach of social media that operated under a different set of conventions. For example, previous cyberpunk text, film, or media frequently supplied and informed users of the templates and conventions or tropes to appropriate in order to either engage in acts of machine-influenced consciousness that promoted the posthuman and the postracial with the traditional casting formula of nonwhites as window dressing, or engage in online cultural tourism, masquerading as the cultural other. In contrast, cyberculture is heavily invested in the idea of forming imagined communities—and, increasingly, the virtual complement to real-world affinity groups—that reflect the needs and desires of online users and is especially impacted by the forces of globalization.

Cosmopolitanism and provincialism are strongly implicated in the growth of social networks and the desire for users to have relationships with relatives and other like-minded users that previous generations of predigital communities were unable to have. For example, despite the consequences of what scholars, politicians, and business leaders refer to as globalization, these forces have not necessarily drawn people closer together. Moreover, it has enabled and made it easier for immigrants in particular to retain cultural ties or connections with families and communities left behind and to slow down the process of identification with new homelands. Therefore, the formation of these imagined communities has empowered users to not only take advantage of organizing their cultural worldviews and social capital for economic or political motivations but also to provide insight into how these identity formations operate across boundaries.

Cyber-Jihad

Cyber-jihad conjures up the fears and apprehensions long associated with the so-called dark side of the Web. The Internet's capacity to transform modern political life, whether as an empowering tool at the disposal of activists and dissenting populations, such as the anticorporate globalization movement, or as an unprecedented megaphone in the hands of politicians, has not totally quelled some underlying fears about the dangers and risks arising from the open nature of the Web. These apprehensions and fears largely stem from new media's sociopolitical and security threats, such as military cyberattacks that could cripple governments and business infrastructure, hacking sensitive intelligence, cyberbullying, cyberterrorism, and cyber-jihad.

While the term *jihad* comes from the Arabic verb *jahada*, which literally means "to struggle," its popular usage has become predominantly associated with Al Qaeda and other Islamist terrorist organizations, especially after the 9/11 attacks. Cyber-jihad conflates those terrorist organizations' use of the Web with regular Muslims' turn to the Internet for religious information and/or benign social, political, or personal uses of the technology. This entry focuses on these twin implications embedded in the concept, the security threat, and religious usage implications of cyber-jihad.

As a security threat, cyber-jihad "loosely describe[s] Islamic extremist terrorists' use of the Internet as a communications, fundraising, recruitment, training, and planning tool in their battle against the enemy," according to R. B. Davis. Cyber-jihad facilitates acts of cyberterrorism, in a "convergence of terrorism and cyberspace"

that may attack computers, networks, and other information infrastructures to disrupt and coerce governments and populations. Terrorists' use of the Internet presents a clear and present danger to targeted governments and communities. The Internet provides a tactical tool to facilitate command-control communications between different members of a terrorist organization. According to this view of cyber-jihad, lack of strong regulation and tough governance regimes turn the Web into a lawless territory and a magnet for terrorists.

The ability to avoid state surveillance and law enforcement detection attracts terrorist organizations to the Internet because they can freely create and use e-mails and Web sites. Internet service providers (ISPs) do not verify the identities of registrants and those wishing to create Web sites undetected. The Internet Corporation for Assigned Names and Numbers (ICANN), the international body in charge of regulating the Internet, does not have enough muscle to police the World Wide Web and prevent terrorists from recruiting, organizing, communicating, and fund-raising online. Further complicating the matter are the jurisdictional issues often faced by those law enforcement organizations like Interpol, who do have the clout, the resources, and the mandate to address transglobal criminal and terrorist threats but who often find themselves bogged down in the reams of red tape generated by nefarious activities that cross national and international boundaries.

From encrypted e-mail and messages, chat rooms, and spam mimicking to password-protected Web sites, Al Qaeda terrorists proved adept at employing the Internet as an operational and tactical platform. After capturing many Al Qaeda terrorists and seizing their computers, U.S. security and intelligence officials discovered computer evidence of encrypted messages and secure Web site communications among the 9/11 conspirators and Al Qaeda leaders, such as Abu Zubaydah, about the planned attacks. In addition to password-protected communication, Al Qaeda-affiliated Web sites host a range of material including terrorist training manuals and propaganda videos. Ansar-al-Islam, an Al Qaeda-affiliated Web site, gained notoriety after posting a video of the beheading of American hostage Nick Berg by Al Qaeda's Iraqi branch. While it is difficult

to provide exact numbers of Web sites that incite terrorism, G. Weimann estimates such Web sites to exceed 4,000 in number. Despite the Web sites' proliferation, Western governments choose not to shut them down as they provide a trove of information regarding terrorist activities and, thus, help in the surveillance of terrorism.

Some critics claim that Islamist terrorism as a threat is overhyped and alarmist at best, pointing to cyber-jihad's religious dimensions, which are worth examining as well. A growing number of Muslims use the Internet as a religious communication tool. In this view of cyber-jihad, sometimes described as e-jihad, the Internet facilitates individual Muslims' quests for self-improvement by providing a source of spiritual guidance, *fatwas*. In this way, the Internet becomes both a means of propagating the faith and of circumventing traditional state censorship in Muslim societies. In shifting the center of authority, these online environments permit Muslim users a degree of anonymity while granting antiestablishment religious *fatwas* unprecedented exposure. Other scholars similarly conclude that the Internet has enabled alternative Islamic voices to be heard, which has decentralized traditional religious authority. In this regard, Internet use appears to squarely fit in with the literal definition of jihad, as improving the self and the community by seeking religious guidance online.

Cyber-Vigilantism

The Internet provides its users with unprecedented means to access and disseminate information, the ability to speak and act anonymously, and a vast potential audience from which to find people with similar passions and convictions. Cyber-vigilantism refers to the ways in which citizens without official legal authority use such affordances to participate in the preservation of law and order in both the online and offline worlds. Unlike traditional vigilantes like those associated with the frontier justice of America's western expansion or the subway patrols of New York City during the 1970s and 1980s, their online counterparts can come together and act more quickly, responding to a wider range of transgressions and acting with diminished accountability, largely shielded from threat of retaliation or physical harm.

Perverved Justice is a prominent antipedophile organization that exercises cyber-vigilante methods to aid official law enforcement, using tactics to target pedophiles that police are not allowed to use and contributing time and expertise that extend the limited resources of the professionals. Its members pose as minors in chat rooms and work to find the identities of adults who engage them in sexual conversations. Before forging a relationship with

police, Perverted Justice carried out its own brand of punishment by publishing the chat transcripts and identifying information to its message board. Members would then attempt to shame the alleged predator by notifying his neighbors, family members, and employers of the illicit acts.

Similar tactics have been employed for a broad spectrum of offenses, including matters trivial to criminal justice systems. In 2005, after a woman refused to clean up after her dog on a subway in South Korea, another rider took a picture of her and uploaded it to a blog, leading to the identification of the culprit only days later. In the large-scale public shaming that followed, cyber-vigilantes unleashed an onslaught of criticism and verbal abuse on the woman and attempted to locate and inform as many of her associates as possible. The speed and ease with which these kinds of damaging public humiliation campaigns can be carried out by anonymous groups without due process is exemplary of both the power and the danger presented by cyber-vigilantism.

The largest and most prolific group of cyber-vigilantes is Anonymous, a loose association of activists and pranksters united by a common Internet subculture. Its members are ideologically heterogeneous but numerous and active, regularly forming both ad hoc and long-term initiatives with targets as varied as copyright enforcement organizations, pedophiles, foreign governments, security companies, and children's online video games. They employ a range of strategies, including public shaming, but with an emphasis on more technical measures, like hacking to access private accounts and information, changing the contents of a Web site, or removing the Web site from the Internet completely. The latter, which results from a distributed denial of service (DDoS) attack, is usually accomplished through control of an army of malware-infected computers. Many of Anonymous's attacks, to the contrary, have succeeded by assembling such an army through members who voluntarily install the software. In this way, individuals are able to take part in organized protest with a few mouse clicks, effecting real monetary, political, or social damages.

Although Anonymous frequently acts internationally and has several times targeted governmental entities, its actions are in defense of openness, against censors and loosely defined oppression,

and not for the benefit or protection of any particular country. In contrast, The Jester, usually written as *th3j35t3r*, is an example of a patriotic hacker, known for taking down dozens of Web sites identified as supporting or recruiting Islamic jihadists. The Jester is notable not just for its success and prolific activities but also for communicating with the public almost entirely through social media, such as using Twitter to advertise each of the strikes as they are happening.

In 2011, an offshoot of Anonymous, which called itself Lulz Security, or LulzSec, too confidently exploited what the Internet grants vigilantes, succeeding in a series of attacks on high-profile targets, each followed by publication of hacked data, all the while taunting its victims and law enforcement alike through Twitter. Although it is common for vigilantes to become folk heroes, in June 2011, LulzSec twisted this role, soliciting requests from fans for sites to attack, resulting in a number of video game-related Web sites going down shortly thereafter. In the year that followed, most of the prominent members of LulzSec were arrested on hacking, conspiracy, and other charges, illustrating the other side of the coin: The Internet fosters a feeling of disconnectedness from real-world consequences, but since the September 11 attacks and the realization that the dangers presented by the very properties of the Internet that make it great, it is increasingly unfriendly to anonymity.

Cyclical Message Strategies

A cyclical message strategy involves using online resources, especially social media such as Twitter, Facebook, and YouTube, to establish a message that will be received and then relayed to other users. Additionally, messages will also have built in a response node, or return path, whereby the receiver sends responsive feedback to the originator of the message so that subsequent waves of messages may be disseminated. When a variety of message channels are interconnected, the life cycle of the message is extended, and its audience is vastly expanded. The use of the Internet and participation in social media sites has had a substantial impact on the nature of the candidate–constituent relationship.

With the proliferation of user-controlled social media sites, it is now possible to friend (or unfriend) the president of the United States. An individual or organization's popularity and well-being are often directly connected to the number of Facebook friends or Twitter followers one can claim. The narrowing of psychological distance between political actors and those who are able to put them into or remove them from office is an outcome of Web-based message delivery systems, including blogs, online news forums, and social media sites.

A study by the Pew Internet and American Life Project found, relative to the 2012 U.S. election cycle, that about one-fifth of registered American voters used a social networking site such as Facebook or Twitter to urge members of their social networks to vote. About one-third of those surveyed reported that others had contacted them via posts on social networking sites to ask them to vote for a specific presidential candidate, either Barack Obama or Mitt Romney. Finally, 22 percent of registered American voters used a social networking site to tell how they voted or intended to vote; when age is factored in, the percentage rises to 29 percent of those under age 50 who did so.

A variety of message channels is used to converse about and influence political matters, including face-to-face conversations, posts to social media, e-mails, and telephone and text messages. The Pew Project found that face-to-face interactions were the most common in the

vote-urging conversations, with 29 percent urging Obama and 32 percent urging Romney. The next most-used channel was social media posts, with 25 percent of those messages coming from both supporters of Obama and of Romney.

Networked Message Cycles

At some point, the multidirectional flow of information becomes user powered, and a message can take on a life of its own, going viral or escaping the Web completely to be taken up by mainstream and elite media. In many cases, the loss of control by the producer over the message is compensated for by the return on investment that comes from the wide reach to networked audiences.

The great majority of the thousands of Internet tools that exist, including social media sites, are free. In this new realm of information channels, the ability to tap into and direct networked political messages through a variety of channels offers a distinct advantage to candidates and campaigns. However, determining which to use and how to use them strategically can be difficult.

Establishing credibility, gaining receiver interest, and triggering receiver action are the intended outcomes of what pioneering Internet strategist Julielyn Gibbons terms cyclical message strategies. Gibbons founded a social media consulting agency, I3 Strategies, as an extension of her work with patient advocacy campaigns and early use of the Internet as a tool in her work as an outreach director for the Michigan Democratic Party. In her home state of Michigan, where she was the first blogger to receive credentials in the Michigan State Capital, U.S. Senator Debbie Stabenow recognized Gibbons for her online advocacy and campaigns.

In 2008, Gibbon spearheaded a David-against-Goliath Web-based campaign that relied successfully on use of social media as essentially free marketing tools to overcome a well-funded opponent. In a similar campaign the same year, Gibbons and her colleagues developed a plan to interconnect Twitter, Facebook, and YouTube presences with Google and Facebook ads. Rather than aiming for a mass audience, Gibbons's group employed microtargeting by age and gender demographics.

Her cyclical message strategy in these campaigns consisted in integrating links, uniform resource locators (URLs), and references to all of the other media in use, in addition to face-to-face

approaches, e-mail marketing, and other more traditional message channels. Each message referenced the other channels and included small calls to action. Gibbons reports,

Some of the tactics that we used included asking supporters to change their Facebook profile picture and Twitter avatar to the campaign logo days before the election, posting and sharing campaign ads and messages on YouTube, encouraging supporters to share on their Facebook walls, creating and spreading a hash tag when folks tweeted about the campaign.

Every message included ways that the receiver could connect back to the campaign's other social media sites.

Another online political innovator is Republican Justin Amash, who as a member of the Michigan House of Representatives, was one of the first to connect directly to constituents by posting his votes on his Facebook page in 2009 and announced his ultimately successful candidacy for U.S. Congress on Facebook. As a member of Congress, Amash's Web site includes links to e-mail, to a newsletter subscription request, and to his voting record on Facebook. The use of Internet resources for political purposes is constantly expanding, as is the sophistication of media-marketing algorithms and their strategic use to drive messages to targeted consumers. New social networking tools, such as Google Wave, are likely to expand the possibilities for transparency, collaboration, and enhanced communication, according to Gibbons. Traditional elite and mainstream media are less prominent as decision drivers for consumer and constituent decisions, as people forage for news on the Internet. Logging software, click path monitoring, data mining, algorithms, and other analytical tools allow for a finely tuned understanding of consumer intentions and behaviors.

Thus, information networkers will increasingly become important in helping political message producers to navigate the labyrinthine connections and networks that now exist. In conjunction with technological savvy, Gibbons and Amash emphasize that the accuracy and authenticity of the message itself is of primary importance.

"You want the social media to be a very natural, authentic extension of the campaign and

candidate or issue," says Gibbons. "If it's forced or faked, the public will know it and you'll look worse than not trying it at all."

"The best way to garner votes and support is by maintaining transparency and communication with voters," concurs Amash. "Most elected officials haven't figured that out yet."

Cynicism, Political

Political cynicism is an important sentiment and is an indicator of the health of a democracy. The

Oxford English Dictionary defines cynic as “a person who believes that people are motivated purely by self-interest rather than acting for honorable or unselfish reasons.” The proposition that politicians are motivated by self-interest rather than the public good is one most readers of this encyclopedia will be familiar with. But, there are further dimensions of political cynicism beyond politicians alone.

Conceptualizing and measuring political cynicism has proven problematic, and disagreement exists over how best to approach it. For many years, scholars made inferences on political cynicism based on American National Election Studies that measured political trust, alienation, and efficacy. While there are some robust links between these measures and political cynicism, Joseph Cappella and Kathleen Hall Jamieson convincingly argue for a set of measures of political cynicism that focus on the following:

. . . the manipulateness of advocates (candidates in campaigns and representatives of groups in policy debates), dishonesty, winning and getting ahead, looking good, using fear, the absence of real choice, and the role of big money.

Nevertheless, it is important to point out that Joseph Cappella and Kathleen Hall Jamieson's measures of cynicism are primarily aimed toward politicians. Other scholars have established a distinction between political cynicism directed at persons on the one hand and issues and institutions on the other. Furthermore, studies have found that these dimensions of political cynicism are not always correlated; for example, a citizen may be cynical toward politicians in his or her country but still have full faith in his or her system of government. This broader dimension of political cynicism is usually more stable and less prone to short-term change than that specific to a particular issue or person.

In many Western democracies, political cynicism is said to be on the rise and has been associated with broader concerns about declining political engagement, party identification, and voter turnout. Research shows that those people most cynical of politics also tend to be the least politically knowledgeable and engaged. Young people tend to be the most cynical of all.

There has been a proliferation of explanations for the apparent rise in political cynicism, with many accounts focusing on the way politics is communicated. Mass media critiques focus on the impact of television entertainment in terms of both its displacement of time available to partake in civic activities and the program content that favors entertainment over civic values, therefore facilitating the conditions in which political cynicism thrives.

Campaign critiques contend that the growing influence of marketing and public relations techniques used by political parties has ruptured the link between citizens and representatives. Negative political campaigning (particularly advertising) has been found to encourage cynicism, though its impact on electoral turnout is disputed.

News media critiques contend that many practices in political journalism are encouraging political cynicism. For some commentators, the news media have shifted from a position of watchdog of the powerful to attack dog, evidenced through increasing journalistic negativity and cynicism toward politicians. A growing body of literature has explored the role of the political interviewer, for example, and how cynicism is increasingly imbued into his or her encounters with politicians. Whereas in the past, interviewers displayed respect and even deference toward politicians, now they are aggressive and confrontational, with an emphasis laid on landing punches or scoring points over their opponent. Such reporting is said to present the political process in a manner designed to encourage suspicion, negativity, and distrust among its audience. In their defense, journalists point out that (1) rather than stirring up voter cynicism, they are merely reflecting it; and (2) politicians have given the public many reasons to be cynical about their motivations (through high-profile scandals and so on).

Social Media

Social media is increasingly important in these debates over political cynicism. The use of social media is becoming an everyday feature of political and civic engagement for many people across the world. A distinctive feature of social media is how it offers many new opportunities for small-scale, low-cost forms of political engagement, which coexist alongside high- and medium-threshold

expressions of engagement. According to research conducted in 2012 by the Pew Research Center's Internet and American Life Project, some 66 percent of social media users—or 39 percent of all American adults—have done at least one of eight civic or political activities with social media. These range from small-scale actions such as reacting to others' postings, sharing political content, or "liking" a political cause, to pressing friends to act on issues and vote, or creating one's own content, which is then shared.

There is much hope that the many opportunities for ordinary citizens to participate in political actions through social media might lead to greater political empowerment and reduced political cynicism. There are many examples of social media facilitating mobilization of like-minded individuals around a political issue or campaign, and sometimes forcing change. Some studies have found that individuals who participate in social media environments are likely to experience a sense of understanding, connection, involvement, and interaction with others who participate in these environments. Other studies have shown how those who use social media, especially Facebook, are more civically and politically active than nonusers.

Young people in particular are increasingly relying on social media as a source of news and information about politics and as a platform for interpersonal political communication. Younger users are more likely to post their own thoughts about issues on social media, post links to political material, encourage others to take political action, belong to a political group on a social networking site, follow elected officials on social media, and like or promote political material others have posted.

Furthermore, by facilitating unmediated, two-way communication between citizens and elected representatives, many hope that more productive connections can be made. In the United States, President Barack Obama has been praised for his innovative use of social media in engaging, mobilizing, and empowering supporters. All over the world, politicians are developing their social media presence. However, studies examining their use of social media find that most politicians

have been slow to embrace its participatory and empowering potential, largely using the platforms for one-way impression management.

Conclusion

Many of the findings mentioned above might suggest that social networking can reduce political cynicism. However, studies that have isolated political cynicism as a dependent variable have not found a significant impact of social media use. Furthermore, despite the fast-growing and diverse repertoires of political engagement offered by social media, levels of political cynicism in most Western countries—especially cynicism directed at elected officials—remain stubbornly high. This would suggest that there are still more powerful explanations for political cynicism, rooted in political socialization, culture, and broader features of political systems. Nevertheless, as social media make increasing inroads into everyday life, and thus political socialization and culture itself, it will be a central focus of future research into political cynicism.

D

Daily Show, The

On July 21, 1996, *The Daily Show*, a satirical news program, premiered on Comedy Central as a replacement for Bill Maher's *Politically Incorrect*. Created by Lizz Winstead and Madeleine Smithberg, and hosted by former ESPN *SportsCenter* coanchor Craig Kilborn, *The Daily Show* parodied traditional newscasts through monologues and on-location reports from correspondents such as Brian Unger and Stephen Colbert. *The Daily Show* quickly developed a sizable audience of young, primarily male, 18- to 36-year-olds, a key demographic for advertisers. Under Kilborn, the focus of the show was popular culture and character-driven human interest story parodies. This changed when Jon Stewart took over as host on January 11, 1999, after Kilborn moved to CBS. Renamed *The Daily Show With Jon Stewart*, the show became much more politically focused.

The show's coverage of the 2000 election, "Indecision 2000," showcased the new editorial voice of the show as a comedic, but informative, option to traditional news sources. While the show tends to present a more liberal viewpoint, the goal is to encourage the audience to question the political discourse being driven by traditional and social media rather than to present a specific agenda. While the show is seen as a soft news source, a 2007 Pew Research Center survey

found that viewers of *The Daily Show* were more knowledgeable about news than people who watched "real" news programs.

Having a media-savvy audience requires the show to be multiplatform in its approach to content delivery. As the Internet and social media gained prominence, the show's audience wanted to be able to view segments from the show and share them with others. Comedy Central, like many media companies at this time, was concerned about allowing its programming to go viral. Originally part of the larger Comedy Central Web site, video of *The Daily Show* could not be downloaded nor could users post comments or blog.

In the summer of 2007, *The Daily Show* launched its own Web site. Users could embed video clips into any social media site because the embedded content serves as a portal back to the show's Web site. By September, the site was receiving more than 800,000 views. After the success of the Web site, *The Daily Show* expanded its social media presence to include Twitter, Facebook, YouTube, Tumblr, and Foursquare. *The Daily Show* was also an early adopter of Facebook's Open Graph applications, which allow users to automatically publish their media use onto their social media sites. Open Graph allows people to see what their friends are reading and watching and, thus, pushes that content to a

broadier audience. Serving as advertising tools for upcoming episodes, the social media sites primarily repurpose the content from the television episodes. However, they also provide a way for fans to share their favorite videos and comment on recent stories, thus creating spaces for instantaneous political discourse.

On September 21, 2010, Jon Stewart announced, at the height of the Tea Party movement, that he would be hosting a Rally to Restore Sanity on the National Mall on October 30, just days before midterm elections. Stephen Colbert of *The Colbert Report* also announced he would hold a March to Keep Fear Alive rally on the same day. Both marches had their own Web sites, and within a day of the announcement, the Rally to Restore Sanity Facebook page indicated that more than 132,000 people planned to attend. Attendance at the event reached more than 200,000, while 4

million streamed the event live over the Internet. Both Stewart and Colbert actively tweeted and posted to Facebook throughout the event.

In October 2012, Jon Stewart faced off against Bill O'Reilly in "The Rumble in the Air-Conditioned Auditorium." This presidential debate parody was streamed online (no other coverage was available) for \$4.95, with half of the proceeds going to charity. The demand was so high that it overloaded the servers, which forced organizers to tweet an apology to fans.

The rally and debate typify how *The Daily Show* utilizes social media to spread its humor and political viewpoints. The events required minimal traditional publicity beyond the initial television announcement followed by information on Facebook and Twitter. Yet, the publicity that the network received was significant as all the major U.S. media outlets provided some level

Retired U.S. Navy admiral and former chairman of the Joint Chiefs of Staff Michael Mullen speaking with Jon Stewart on *The Daily Show* on September 12, 2011. After some initial reluctance on the part of Comedy Central to make content available online, *The Daily Show* embraced social media; its Facebook page had 3.5 million "likes" and it had 951,000 followers on Twitter as of October 2012.

of coverage about both events. *The Daily Show* has shown that, by embracing social media, the show develops a greater reach into and understanding of its audience, who are able to stay connected with the show no matter what device they are using. While Stewart may not call himself a journalist or politician, his influence on political culture is significant. As of September 30, 2012, *The Daily Show*'s Facebook page had 3.5 million "likes" and 951,000 followers on Twitter.

DailyCaller.com

In the competitive political news market, the Daily Caller has emerged as one of the leading voices of right-leaning/libertarian journalism. As an online-only entity, the Daily Caller effectively uses social media by teasing story slugs to attract consumers to its multimedia content. With over 100,000 Twitter followers, @DailyCaller bills itself as "USA's fastest growing news Web site dedicated to providing our audience with original reporting, in-depth investigations and thought-provoking

commentary." The Daily Caller has found a niche by making its content readily available to frequent news readers through social media, a YouTube channel, and mobile platforms for iPad and Android users.

Journalist Tucker Carlson, the former cohost of CNN's *Crossfire*, launched the Daily Caller in early 2010 alongside his college roommate, Neil Patel, a former aide to Vice President Dick Cheney. Carlson began his journalism career in the 1990s at the *Arkansas Democrat-Gazette* and then later at the *Weekly Standard*. The site found immediate success, surpassing its traffic estimates in its first 10 months of existence, according to Carlson. Now the Daily Caller is a profitable entity. In January 2013, the site claimed 6.3 million unique visitors, an audience Carlson says rivals that of the *Boston Globe* and *Miami Herald*.

The Daily Caller often employs slideshows to go along with its stories in an effort to increase user clicks. One such slideshow, "Top 10 Most Punchable Faces in Media," created by Entertainment Editor Taylor Bigler, gained a lot of attention in social media prior to the 2012 presidential election. Bigler's slideshow was based on a comment MSNBC host Lawrence O'Donnell made about Mitt Romney's son Taggart Romney saying he wanted to take a swing at President Barack Obama.

In an effort to run a lean operation, the Daily Caller has a staff of just under 50 people and tends to hire younger reporters out of college while also utilizing a lot of content generated from freelancers.

Although it is part of the new wave of online journalism, representatives of the Daily Caller are now entrenched in the Washington, D.C., news establishment as they belong to the press corps on Capitol Hill and the White House press pool. As a result, the Daily Caller's roster of talent is often featured as guests on major cable and broadcast news programs.

The Web site is a mixture of news, features, opinions, and investigative pieces with topics ranging from politics to pop culture and sports. Content is often based around catchy headlines and stories that utilize a combination of pictures, video, text, and embedded links. Many maintain that the Daily Caller's amount of original material—both text and video—has helped it emerge

as a top journalistic voice rather than just a partisan outlet. Noted left-wing watchdog group Media Matters is often critical of the Daily Caller and its journalists for what the organization contends is biased reporting that unfairly distorts liberal points of view and President Obama. In turn, the Daily Caller has run a series of articles that details the close relationship Media Matters' director David Brock has with the Obama administration and MSNBC executives.

The Daily Caller covered in-depth the court case of Philadelphia "abortion doctor" Kermit Gosnell and the terrorist attacks on the U.S. embassy in Benghazi, Libya.

Key Figures

The Daily Caller attempts to avoid being a mouthpiece for the Republican Party. While former Bill Clinton associate Lanny Davis has published material on the site, and Mickey Kaus, a liberal on many topics, is a prominent writer for the site, most of the key editorial figures call upon a right-leaning background. Matt Lewis, one of the Daily Caller's commentators, is a renowned conservative blogger who first gained notoriety with America Online's Politics Daily. Vincent Coglianesse, a senior editor, has spent time with the Heritage Foundation and in conservative talk radio. The site's original primary investor, Foster Friess, is a prominent conservative financier.

Senior video reporter Nicholas Ballasy's style of guerrilla journalism plays well for the site and its social media identity. Ballasy has caught up with numerous politicians including Bill Clinton, Howard Dean, and Mitt Romney and entertainers like Clint Eastwood, Tom Hanks, and Matt Damon in public settings, putting them on the spot with interviews that are then often shared virally.

Controversy

In March 2013, the Daily Caller published claims made by Dominican prostitutes that they were paid by New Jersey Senator Robert Menendez for sex. Menendez disputed the claims, and later Dominican investigators reported that someone from the Daily Caller entered the country and offered to pay prostitutes \$5,000 to make claims about Menendez. Speaking on behalf of the Daily Caller, Carlson said his site "never paid anyone,

was never asked to pay anyone and of course never would pay anyone for this story." After facing criticism about the Menendez prostitute story by those on social media, Carlson responded, "Why should I care if a bunch of losers on Twitter don't like it?"

Daniel Pearl Freedom of the Press Act

The Daniel Pearl Act of 2009 was signed into law by President Barack Obama on May 17, 2010. As an amendment to the Foreign Assistance Act of 1961, the act requires the secretary of state to expand the examination of the status of freedom of the press worldwide in an attempt to draw attention to governments that attempt to silence or condone media opposition by censorship, coercion, imprisonment, or death. This addition to the U.S. State Department's Annual Country Reports on Human Rights Practices identifies countries where freedom of the press is violated, including imprisonment or other sources of pressure, physical attacks, or censorship from sources including the government, military, police forces, intelligence agencies, rebel or extremist groups, or criminal groups. The annual reports incorporate information about the status of the press in

foreign countries, violations to press freedoms, and actions taken by local governments to remedy those situations.

Freedom of the press includes descriptions of efforts to improve or preserve media independence, as well as an assessment of progress made on efforts to improve media treatment. In countries identified as having severe violations of freedom of the press, the report must detail government involvement (participation or condoning violations of press freedom), the actions that the government has taken to preserve the safety and independence of the media, and measures taken to prosecute those who attack, injure, censor, or murder journalists. The annual report factors into decisions made by the U.S. Congress as it considers foreign aid and human rights issues.

Daniel Pearl

The Daniel Pearl Freedom of the Press Act is named in honor of former *Wall Street Journal* reporter Daniel Pearl, a veteran correspondent who was reporting on terrorist groups in Pakistan. Specifically, he was attempting to discover possible financial links between Richard Reid, known as the “shoe bomber,” and Al Qaeda. Pearl was abducted in Karachi on January 23, 2002, just four months after the September 11, 2001, terrorist attacks. His Islamic extremist kidnappers, calling themselves the National Movement for the Restoration of Pakistani Sovereignty, saw Pearl as a symbol on several levels: a media figure, an American, and a Jew. They demanded a range of actions from the United States for his return, sending photos of him holding up a newspaper with handcuffed hands and a gun at his head.

Pearl’s kidnapping garnered attention from people around the world; his pregnant wife called for Pearl’s release. Several weeks passed without information about his whereabouts or fate; his murder by decapitation was confirmed on February 21, 2002, via a three-minute videotape titled *The Slaughter of the Spy-Journalist, the Jew Daniel Pearl* that showed Pearl’s mutilated body. His body was found on May 16 in Gadap, about 30 miles north of Karachi, in a shallow grave. Three of the murder suspects were caught after the Internet protocol (IP) address of the initial ransom demands was traced. Ahmed Omar Saeed Sheih, identified as the mastermind, surrendered. They

Journalist Daniel Pearl was reporting on terrorist groups in Pakistan when he was abducted by Islamic extremists in Karachi on January 23, 2002. The act, named in his honor and signed into law in May 2010, amends the Foreign Assistance Act of 1961.

were convicted on July 15, 2002, and sentenced to death, but those sentences remain on appeal. In March 2007, during a closed military hearing at Guantanamo Bay, Khalid Sheikh Mohammed, mastermind of the September 11 terrorist attacks, said that he had personally beheaded Pearl. Pearl was 38 when he died.

Legislation

The bill that established the Daniel Pearl Freedom of the Press Act was sponsored in the House by Representatives Adam Schiff (D-CA) and Mike Pence (R-IN) as H.R. 3714, introduced on October 1, 2009. It passed 403–12 on December 16, 2009. Sponsored in the Senate by Senator Christopher Dodd (D-CT) as S. 1739, it passed the Senate unopposed on April 29, 2010, after a controversial provision providing grants for independent media was removed. On May 17, 2010, President Barack Obama signed the legislation,

with Pearl's widow Mariane, his 7-year-old son Adam Daniel (born after Pearl's murder), his parents Judea and Ruth, and his sisters Michelle and Tamara attending.

As recorded by the White House, President Obama said,

I am very proud to be able to sign the Daniel Pearl Freedom of the Press Act, a piece of legislation that sends a strong signal about our core values when it comes to the freedom of the press. All around the world there are enormously courageous journalists and bloggers who, at great risk to themselves, are trying to shine a light on the critical issues that the people of their country face; who are the frontlines against tyranny and oppression. And obviously the loss of Daniel Pearl was one of those moments that captured the world's imagination because it reminded us of how valuable a free press is, and it reminded us that there are those who would go to any length in order to silence journalists around the world.

In a press release marking the signing, Judea and Ruth Pearl said, in part,

We absolutely agree with the president that this act sends a strong message for defending the freedom of the press and empowering Danny's colleagues around the world to seek the truth and share their reporting without fear of retribution from their government.

Conclusion

Daniel Pearl has been remembered as a symbol of hope who has inspired others toward developing cultural understanding. His legacy has resulted in a stronger U.S. policy concerning freedom of the press. Representative Adam Schiff, one of the main sponsors of the act, stated on April 30, 2010,

Daniel Pearl's life was an inspiration to all of us. We hope this legislation will help the United States work with other nations to better protect his colleagues serving on the frontlines in the fight for greater accountability and transparency. Freedom of expression cannot exist where journalists are not safe from persecution and attack. Our government must

promote freedom of the press by putting on center stage those countries in which journalists are killed, imprisoned, kidnapped, threatened, or censored.

Data Mining

Three inter-related concepts capture both the nature and the importance of social media meta-information in the political process. Political use of social media, "big data," and "data mining" constitute a powerful triangle in elections, each determining and informing the other.

Politicians use social media as strategic tools mainly for election campaigns with the aim to connect with their publics and advertise their candidacies. Issues related to the impact of social media on democracy and public debate raise significant questions of global interest, such as (1) the impact of social media on political communication and civic engagement; and (2) how politicians in different political systems use social media to communicate with the voters, according to James Webster.

Philip Howard writes that campaigns are complex exercises in the creation, transmission, and mutation of significant political symbols; however, there are important differences between political communication through new media and political communication through traditional media.

As social media is widely used for various purposes, vast amounts of user-generated data exist and can be made available for data mining of social media, which can expand researchers' capabilities of understanding new phenomena and improve business intelligence to provide better services and develop innovative opportunities, P. Gundecha and P. Liu have found. An effective political campaign is about defining and acknowledging the stakeholders, framing arguments, and creating icons, and all three of these kinds of political objects are much easier to manage using the new communications tools developed over the last decade, says Philip Howard. Information is still power, but having raw data does not a king make, and instead, Philip Howard proposes that it is the careful production of political culture through the manipulation of data that makes political power. The implications of thinned citizenship roles and data shadows are profound, and people must continue to assess trends in political communication both in terms of individual voter behavior and the larger character of political culture.

Understanding the opinions of the general public and consumers may uncover unknown patterns, and that is the goal of data mining processes. Patterns of consumption evolve with changes in the digital media marketplace; social media have emerged to challenge the notions of what media are, how they operate, and how they impact society, says J. G. Webster. Social media data is largely user-generated content on social media sites, and it is vast, noisy, distributed, unstructured, and

dynamic—characteristics that pose challenges to data mining tasks to invent new, efficient techniques and algorithms.

Data mining (DT), knowledge discovery from data (KDD) or knowledge discovery and data mining (KDDM) are all umbrella terms describing several activities and techniques for extracting information from data and suggesting patterns in very large databases, which includes massive data collection, data warehouses, statistical analysis, and deductive learning techniques. P. Gundecha and P. Liu propose that it is an integral part of many related fields including statistics, machine learning, pattern recognition, rule induction, genetic algorithms, decision support systems, bioinformatics, business intelligence, data visualization, and information retrieval. Data mining algorithms aim to effectively handle large-scale data, extract actionable patterns, and allow insights. For instance, analysis of variance (ANOVA) or Kruskal-Wallis tests can be used to compare audiences; multivariate regression models or time series are for predictions; tree analysis or latent class models target voters; and multidimensional scaling helps in analyzing the positioning of media.

New Techniques

New examples of data mining techniques used in the contemporary era are algorithms that are commonly found in the machine learning and data mining communities, such as artificial neural networks, decision trees, and support vector machines. M. Hindman, K. Tsioutsouliklis, and J. Johnson propose using crawl depth to capture surfer behavior that starts at each of the seed sites, and then follow all of a site's outgoing hyperlinks, downloading all of the pages accessible from a given seed site. These downloaded pages are then classified as either positive (similar to pages in the seed set) or negative (more similar to a reference collection of random content). The depth of the crawl reflects the number of iterations of this process, and thus how many hyperlinks away a site can be from one of the original seed sites.

Next they used support vector machines classifier (SVMC): After being provided with both a positive set (in this case the seed set) and a negative set (a collection of random Web pages), the SVMC inductively learns to differentiate between

relevant and irrelevant pages, producing highly reliable classification of Web pages.

Advantages

Before the 2012 U.S. presidential election, Erin McCarthy and Micah Sifry described the enormous advantages they foresaw for the techniques of data mining in election campaigns:

The 2012 U.S. election may very well come down to who leverages big data better. So far, Obama has a five-year head start and is the clear frontrunner when it comes to leveraging data, data mining, and social media to achieve very real results. . . . This will be a year of discovery in exploring how quickly things can change in the new world of social communication. . . . Mitt Romney is just now beginning to consider building an analytics team and infrastructure. A *Huffington Post* AP report, “Mitt Romney Uses Secretive Data Mining to Identify Wealthy Donors,” said Romney’s data mining activities started as early as June.

The smartest campaigns now believe they know who will vote for candidates even before voters do. S. Issenberg tracks these fascinating techniques—which include cutting-edge persuasion experiments, innovative ways to mobilize voters, heavily researched electioneering methods—and shows how the most important figures, such as Barack Obama and Mitt Romney, are putting them to use with surprising skill and alacrity.

Data.gov

Data.gov is a U.S. government Web site launched on May 21, 2009, that provides public access to data generated and held by the federal government. At the nexus of the “open data” and “e-government” movements, Data.gov is a vast repository of government data sets, a source for information about how to access, use, and build the repository, as well as an interactive platform with research tools that leverage the data. As of May 2013, the Web site claims to host approximately 450,000 data sets derived from 172 federal agencies, a significant growth from the 47 data sets that were initially made available at its inception. Almost 60 percent of the data falls into either the category of “geography and the environment” or “transportation.” Some of the other categories include “national security and veterans affairs,” “population,” “energy and utilities,” “federal government finances and employment,” and “information and communication.”

The site is one manifestation of the Obama Administration’s Open Government Initiative, an attempt to bridge citizen-government divides through the creation of a more inclusive, transparent, and accountable administration. Data.gov was launched by Vivek Kundra, the first

chief information officer of the United States, and is currently managed by the General Services Administration's Office of Citizen Services and Innovative Technologies, in connection with the national chief information officer and chief technology officer. Though recent federal budget cuts have threatened the viability of the site, Data.gov continues to serve as a model for open government. It was one of the first U.S. government Web sites to move to the cloud, and is a leader in the open data movement that has spread to more than 40 countries throughout the world, as well as to entities like the Organisation for Economic Co-operation and Development, the United Nations, and the World Bank.

Technical Architecture

In both its conceptualization and everyday usage, Data.gov broadly reflects technical architectural principles that are characterized by various "open" movements, particularly those of "open data" and "open source" (software). Beyond making content available to the public, raw data sets available through the site are organized by type (such as table, chart, map, calendar, files and documents, or forms), agency, category, and topic to allow for more efficient access by users. Geospatial data is also available. Data sets are also accessible in a variety of formats that are machine-readable and platform-independent, namely CSV, XML, KML, and SHP. This allows users to create tools (such as widgets, gadgets, data extraction tools, and Rich Site Summary [RSS] feeds) based on the materials contained in one or more of the relevant raw data sets. Ensuring that this raw data can be marked up to allow for machine interoperability is a central component of the Semantic Web initiative, whose incorporation Data.gov details in their "Concept of Operations" document. The site also promotes an open source approach to software development, in that it makes the architecture leveraged by Data.gov to publish datasets available to interested developers themselves. This "Open Government Platform" is based on Drupal, an open source content management system, and includes modules for data, content, and visitor relationship management. The source code is hosted on GitHub, which uses a particular revision control system to manage collective software development projects.

Open and Electronic Government

Data.gov is one of 18 sites that compose the Obama administration's Open Government Initiative. Upon taking office in January 2009, President Obama released an "Open Government Directive" directing government departments and agencies to increase the transparency of government activities while also promoting citizen participation in, and collaboration with, government programs and services. Specifically, the directive requires these departments to take the following steps toward a more open government: (1) publishing government information online; (2) improving the quality of government information; (3) creating and institutionalizing a culture of open government; and (4) creating an enabling policy framework for open government. An Executive Order issued by the White House on May 9, 2013, further clarified the role of Data.gov by mandating that the data disseminated by the government be open and machine-readable as the new default standard. To promote its efforts, Data.gov maintains a blog on its Web site and has an active presence across popular social media platforms, such as Twitter.

Community and Developer Engagement

Data.gov fosters a variety of end-user communities, so as to provide a space where like-minded researchers and citizens may access material that is particularly relevant to their needs. Examples of these target sectors include agriculture, education, energy, health, and manufacturing. A special "developers" section of the site engages the developer community by encouraging participation and collaboration on projects that make use of government data. Additionally, developers may provide feedback as to what datasets they would like to see on Data.gov as an application programming interface (API), and may join challenges pertaining to the effective usage of open data via a related Web site, Challenge.gov.

Through these mechanisms, Data.gov "crowd-sources" solutions to managing open data in partnership with various individuals and organizations in the broader public and private sectors. For example, the Sunlight Foundation, an educational organization committed to increasing accountability in the U.S. government, ran an "Apps for America" contest in 2010 to leverage the data sets released through Data.gov. Among

the submissions was a tool designed to help check wait times for security screenings at airports. Other mobile and Web-based applications based on data sets published through Data.gov include an alternative fuel locator, a tool to look up product recalls, and a search engine for traffic safety statistics. In March 2013, Data.gov recorded over 6,000 daily visitors, including hits from outside the United States, and published over 1,300 new data sets to the Web site.

Debate

The integration of social media and politics has altered the foundations of many traditional political processes and provided new methods through which people can engage with politics. The use of social media both for and during political debates offers new options for hosting political debates and has changed how individuals, the media, and candidates engage in political debating.

History of Social Media Debates

Online political debates, also referred to as e-debates, date back to the mid-1990s, with

candidates at local, state, and national levels participating in rudimentary forms of online debate. These debates, which were organized and hosted by various organizations and media outlets, attempted to harness and capitalize on the growing power of the political Internet. Questions for these debates were drawn from comments made on the campaign trail, and the hosting organization would post the candidates' answers to a Web site for the public to read.

While these debates occurred through online technologies, the public could not ask the candidates questions nor interact with them; interested individuals would have to either follow the debate via the Web site or sign up to receive the debate through e-mail. These debates did, however, utilize early forms of wikis (Web sites that allow users to add, modify, or delete content) and other group-page technologies, where individuals could discuss the candidates' answers. As online technologies continued to evolve, organizations and media outlets continued to experiment with various types of e-debates.

In 2008, technology and politics began connecting in new ways, and social media provided new options for reaching and engaging audiences in online debating. The explosive use of social media during the 2008 presidential election marked a substantial shift in both social media platforms as hosts of political debates and in the integration of social media functionalities into televised debates. Major media outlets and social networking sites, such as CNN, YouTube, Myspace, Yahoo!, the *Huffington Post*, and *Slate*, teamed up to host political debates and candidate forums and to engage the public in political debating in a new way.

The CNN-YouTube presidential candidate debates invited the public to submit questions to the candidates via 30-second videos uploaded to YouTube. These questions, if selected, would be featured during two live candidate forum debates broadcast on CNN. Between the two debates, more than 8,000 videos were submitted for possible inclusion, with roughly 80 videos being selected for broadcast. During the debates, the candidates responded directly to the videos, marking the first time that unfiltered questions created by the public were answered during nationally televised debates. The two broadcasts broke debate viewership records for both viewership on cable news

and for viewership from the ages of 18 to 34. The candidates' answers were then uploaded to YouTube's YouChoose 2008 platform, where users could discuss the candidates' answers through the site's social media functions.

Attempting to specifically target a younger generation of voters, Yahoo!, the *Huffington Post*, and Slate teamed up to host an entirely online and interactive set of candidate debates. These debates, which ran simultaneously on all three organizations' Web sites, allowed users to submit questions that were posed directly to the candidates. The candidates responded live, via the Internet, and debate viewers were able to evaluate the candidates' answers and performance in real time.

Myspace and MTV took a slightly different approach while still using social media to engage the public in conversation with the candidates. These media outlets promoted a series of candidate dialogues, town-hall style discussions that were hosted on various college campuses, Webcast live on the MyspaceTV video platform and MTV.com, and broadcast on MTV and MTVU. While these were not candidate debates, the questions were submitted by the public through the MyspaceIM instant messaging platform, e-mail, or text message, and online viewers could ask the candidates follow-up questions, respond online to the candidates' answers, and debate among each other in real time.

Capitalizing even further on the relationship between social media and political debates, Myspace sought and received official sanctioning by the Commission on Presidential Debates (CPD) to launch MyDebates.org. The Web site offered a downloadable application that streamed the presidential debates live, provided searching and tagging capabilities, allowed the debates to be archived for on-demand viewing, organized online polls, and tracked the candidates' positions on issues. This marked the first time that the CPD partnered with an Internet and social media outlets for debate coverage.

The integration of social media into political debates has continued to increase as social media technologies have evolved. Major mainstream media, online services, and social networking outlets have worked with the CPD to develop live debate streams and live reaction platforms. Even Xbox Live, the gaming system, incorporated into

its social networking functionalities a way for subscribers to use their controllers to judge candidates' debate responses as they were speaking. Other interesting uses of social media appeared throughout the 2012 presidential primary debates and included the solicitation of debate questions via Twitter and inviting the viewing audience to submit real-time feedback via social media, some of which was inserted by the moderators into the live debates.

These debates, candidate conversations, and social networking initiatives illustrate the distinct shift in the level of participation that voters can now exercise in political debates. While they all functioned differently, they are indicators of the impact of social media upon political debates and provide a lens through which the rise of social media in political debates may be viewed. Integrating social media into political debates offers the public a level of interactivity with the process and the candidates that was once reserved for high-level donors and other political elite. The future of successful political debate must address an expectation of interactivity with the common voter and will be marked by campaigns' abilities to effectively engage the public through social media.

How Social Media Has Changed Debate

Social media has substantially altered the ways that individuals, the media, and the candidates engage in political debate. Debate viewers are no longer simply passive audience members; instead many have become dual screeners, or viewers who watch debates on television and simultaneously follow, discuss, and tweet about the debates through computers or mobile devices. Through sharing opinions, fact-checking, assessing diverse perspectives, and judging the candidates' performance, participation in social media during televised debates has changed the level of engagement many audience members have with political debates. Debate interaction through social media has also provided the media and political campaigns with a ready-made focus group of at-home viewers through which to assess the public's thoughts, perceptions, and opinions.

The Audience

Social media has provided new methods for a generalized audience to engage in political debate

discussion. Historically, there have been very limited opportunities for the public to engage with the formalized political debate system. While town-hall formats have allowed for a minimal level of participation, the collective public has never possessed much ability to have unfettered discussions about political debates that the mainstream media and political campaigns actually paid attention to, until social media. Through engagement with social media functionalities during televised debates, audience members are expanding the sphere of engagement and using social networks to have influence, voice opinions, and be involved. Through millions of posts, comment, and tweets, online engagement in political debates fosters a more genuine dialogue between the constituencies and allows the audience to be engaged at a substantial level.

Candidates can no longer assume that political gaffes will be missed or quickly forgotten by the media as the social media sphere will capitalize on these in ways not previously fathomed. In this way, the public is able to leverage the functionalities of the social media environment to insert itself into political agendas and upend political messages carefully crafted by the political and media elite. This ability makes it practically impossible for either the media or the campaigns to ignore the public's engagement and quickly turns political moments into pop culture fodder. Social media have also pushed campaigns to be more responsible in their distribution of facts during debates. Dual screeners are often also savvy Internet users who can instantaneously fact-check any statement made by any candidate, pundit, or media personality. Social media allows the audience to quickly identify incorrect information, find the correct facts, and link followers to the accurate information; these instant fact-checks keep the constituency aware and discourage campaigns from providing false or misrepresented information.

The Media

Audience engagement with social media has pushed the mainstream media to find ways to effectively integrate what occurs in the social media environment into broadcasts. The audience no longer needs to wait for pundits to analyze debates or candidate's answers for them because they have access to reactions and opinions from

pundits, journalists, bloggers, other politicians, and average citizens unfolding in real time through social media. The mainstream media, specifically cable news outlets, have recognized the emerging role of the viewers' voice in politics and also the importance of engaging with these viewers. It is not uncommon for news anchors to cite audience tweets and Facebook posts during newscasts, make political predictions based on Twitter reactions, or have the creators of Facebook or Twitter pages on as guests to discuss what is occurring on social media regarding a topic or candidate. Social media has helped to democratize political commentary in the mainstream media and has given a voice to a wider range of political participants who can help to shape debate narratives long before the television pundits have the opportunity to dissect debates for the audience.

The Candidates

Social media has also substantially altered the ways in which candidates and campaigns engage in and respond to debates. Social media provide instant indicators regarding the public opinion of a candidate's answer or stance on an issue. Social media sites allow campaigns to quickly and efficiently determine what topics are resonating, or trending, with potential voters and what topics the voters attach the most significance to. Often, what is being discovered through social media analysis is that the issues that the campaigns have attached the most significance to are not the issues that their constituencies find most important. Social media listening (real-time monitoring and analysis of social media traffic) allows campaigns to better understand what issues are resonating with potential voters and strategize how to effectively communicate with these voters during debates.

Prior to social media, campaigns would have to wait until after the debates to gain access to audience opinions and reactions through formalized debate analysis methods. With social media, the spin rooms of the past are no longer necessary as campaigns can now analyze rapid-fire online chatter to judge in real time the audiences' responses to the debate. In addition, most social media sites also include some type of user geolocation data, which makes it easy for campaigns to identify the locations of the posters, understand how their candidate is being received, and what

Many different types of organizations have experimented with the use of social media to engage the public in e-debates. These men watched economic debate videos in a “YouTube Corner” at the annual meeting of the World Economic Forum in Davos, Switzerland, on January 28, 2009. Among the many platforms and media outlets having an impact in online debates are Facebook, Myspace, YouTube, Twitter, Yahoo!, Xbox Live, CNN, the Huffington Post, and Slate.

is trending by geographic region; this data could be especially important in vital battleground and swing states. For campaigns and advocacy groups, the integration of social media into debates can also serve as a boon for candidates, with massive amounts of online communication pushing information about their candidates directly to voters, even those who may not be watching the televised debates, through status updates, tweets, links to videos, and other types of online content.

Social media has also changed how candidates engage opponents in online debate. Campaigns are not only using social media updates and engagement to push their own platforms but also to attack the credibility, stance, or statements of their opponents. Social media have allowed campaigns ways to quickly and efficiently rebut claims made by opponents and negatively reframe opponents' talking points. Social media have also led to the rise of hashtag attacks, or the appropriation of a hashtag written by the opposition and used to reframe the conversation against an opponent. Although social media has become

a consistent tool in contemporary digital campaigns, candidates are using the platforms mainly to push their direct messages and discredit opponents versus using it to engage in conversation or debate with the potential voters. With a voting population that is increasingly engaged in social networking, the successful incorporation of social media into debate strategies will be vital.

The future relationship between social media and political debates is uncertain. While many major media outlets have embraced the role of social media in political debate, the CPD and most debate moderators have not largely accepted social media into the formalized political debate process. As social media functionalities continue to develop, they will likely continue to grow in importance as an increasingly active channel of political engagement and allow for a more robust and accountable discussion of key issues facing the constituency.

Deception in Political Social Media

The anonymity of the Internet, which has only recently with the explosive growth of Facebook ceased to be a default condition, has always lent itself to abuse. It has always been relatively simple, and certainly very common, for Internet users to pretend to be people they are not, and to do so for various purposes: sometimes anonymity is an important shield against abuse or to enable the same kind of forthright honesty enabled by offline venues of anonymity like 12-step programs and the Catholic confessional. Sometimes it has allowed teenagers to lie about their age and interact in a social world of adults. Sometimes it provides a cover for whistle-blowing and other important activities. But the types of abuse are obvious: fraud, trolling, harassment, and others. As politics has extended into social media, naturally political figures and groups have both committed and fallen victim to these abuses. This is not surprising: money in politics is spent, ultimately, to convince the audience of an idea, whether that idea is to vote for a candidate, to support a cause, or to believe a particular interpretation of a set of facts. Competition can often encourage deception.

At its most basic, the deception committed in social media is simply an extension of other deceptive statements, as when political groups provide an account of events that is heavy on spin or leaves out elements that might be crucial to the reader's interpretation. A prominent example in recent history was the Kony 2012 viral video campaign launched by Invisible Children, a San Diego-based organization founded to raise awareness, especially among young people, of Joseph Kony and his Lord's Resistance Army in Africa.

The video spread virally and was tweeted and otherwise linked to by numerous celebrities. *Time* magazine ranked it the most viral video of all time. But the video portrayed Kony as being in Uganda, glossing over the fact that he had left six years earlier and was likely in the Central African Republic, and an intervention by the Ugandan army as advocated by the video would be either pointless or circuitous. The "Stop Kony" campaign associated with Kony 2012 had the size and shape of a major social justice movement, but was often criticized for not being grounded in the facts of the real-life situation in Africa and the problems of real-world child soldiers.

Fake Accounts

According to a 2013 *Wired* article, it has become a simple business matter to purchase fake Facebook friends, Google+ friends, Twitter followers, Twitter retweets, Facebook "likes," or other quantitative forms of social media support. An internal Facebook study in 2012 revealed that 83 million of Facebook's 955 million accounts were either false accounts or duplicates (such as maintained by people who have separate personal and professional accounts). Most of these fakes were not politically connected and many were likely not maliciously deceptive. But among them are millions of false accounts created and maintained by social media management companies in order to create the illusion of popularity or support.

According to a 2013 *Guardian* article "Click Farms," usually operated overseas where labor is cheaper, have workers either retweeting tweets, liking Facebook pages and posts, or adding Twitter or Facebook friends from numerous fake accounts, for a predetermined fee, such as \$15 per 1,000 Facebook "likes," or \$100 per 1,000 Twitter followers. This practice is common outside

politics, where marketers have discovered that the number of “likes,” fans, friends, or followers is important to a large number of consumers, who weigh these quantitative data much as they do the qualitative data of reviews.

When Facebook purged known fake accounts, as reported by TechCrunch, some of the fan pages that lost the most “likes” as a result were those of games—Texas Hold’em Poker (the mobile app and Facebook game), CityVille, and FarmVille—and pop singers Justin Bieber and Lady Gaga. One company advertised having 83,000 social media personas—each with multiple social media accounts on different platforms like Facebook and Twitter—which it could use to generate “likes” and friends. In 2013, a botnet—using 1.8 million linked personal computers—was discovered to be generating 3 million clicks per day (liking, retweeting, and other social media activities) and earning \$1 million per year from its customers. A 2013 study by Barracuda Labs found that the average consumer of fake Twitter followers purchased 50,000 followers; 16 percent had boosted their support to more than 1 million followers, though in those cases it was not clear how many were fake. Major brands accused of purchasing fake social media support include Pepsi, Louis Vuitton, Sean “P. Diddy” Combs, and Mercedes Benz.

Politicians and Fake Accounts

In 2012, the Mitt Romney presidential campaign was accused of having hired one of these companies to generate hundreds of thousands of fake Facebook “likes” and Twitter followers. Beginning in July, his average number of new Twitter followers increased from 3,500 per day to 62,000 a day, overnight. Facebook “likes” similarly climbed steadily in late July, spiking drastically just in time to hit 3 million “likes” on August 1 (and 3.2 million a day later, despite an increase of less than 2,000 a day a week earlier). Part of the motivation may have been the launching of the Twitter Political Index, which claimed to track enthusiasm levels for Romney and President Barack Obama. Creating fake Twitter accounts was an easy way to manipulate the index. Later in the month, Obama’s campaign was accused of having used the same tactic. Failed Republican candidate Newt Gingrich may have beaten them both to the punch: the previous year, when Romney had fewer than

100,000 Twitter followers, Gingrich had 1.3 million, and bragged about them to the press several times before it was discovered that 82 percent of them were fake accounts (though that still leaves his real total as higher than Romney’s).

Fake accounts are used not only to bolster the appearance of support of specific politicians, campaigns, and initiatives, but to encourage the spread of particular memes and talking points. A careful examination of some of the most-shared political posts and meme images on Facebook, especially those that are controversial or related to a current issue before Congress or in the news, will reveal among the sharers and likers a number of accounts that are almost certainly fake. (Tell-tale signs on Facebook are a use of only one profile photo, a busy feed but little to no personal interaction with friends, and minimal profile information.) These fake accounts may actually be actively maintained instead of existing just to generate “likes”—they may be used as incognito personas for political action committee (PAC) staffers and political party operatives to comment from, discredit opponents’ supporters, and manipulate the online conversation.

Fake Facebook and other social media accounts claiming to belong to politicians and public figures are common, and sometimes used as parody or online roleplaying games. Other times they are actively deceptive or used for political propaganda by opponents. In 2009, a 38-year-old screenwriter, Alex Grossman, created a fake Facebook account, “Governor Palin,” for former vice presidential candidate Sarah Palin. He said later that he created the account in order to demonstrate the low political acumen of Palin’s supporters, and made frequent updates to the account that were a mild parody of Palin’s persona, such as “God loves us all, now matter how black or African, or even gay or Jewish we are.”

In 2011, a cache of 75,000 private e-mails obtained by the hacktivist group Anonymous and released to the public online revealed that defense contractor HBGary Federal had discussed a plan to work with partner companies Berico Technologies and Palantir in order to create fake social media profiles to infiltrate leftist political groups. One of the profiles was explicitly discussed, that of a Holly Weber who worked for Lockheed Martin and maintained Facebook and LinkedIn

accounts. HBGary Federal staff also brainstormed strategies for pretending to be teenagers online. The “persona management” operation was proposed as a \$2 million project, and was the basis for various projects HBGary attempted to sell to the federal government.

Though attention has been focused on generating false “likes” and followers in social media, denying real ones is another form of deception. In 2010, Sarah Palin favorited and retweeted a tweet made by neoconservative commentator Ann Coulter, linking an image of a sign saying, “The blood of Jesus against Obama history made 4 Nov 2008 a Taliban Muslim illegally elected president USA: Hussein.” Palin deleted the tweet and claimed it wasn’t intentional.

Decoy Campaign Web Sites

The first candidate Web site was constructed by U.S. Senator Dianne Feinstein’s campaign in 1994. A decade later, Howard Dean’s pioneering use of Meetup.com and a myriad of individual bloggers as a fund-raising, information-generating network in the 2004 election cycle was another landmark in electronic campaigning. Then, in 2008, Barack Obama was named both “the first Internet President” and *Advertising Age* magazine’s “Marketer of the Year” for the Web savvy demonstrated by his campaign. Further transformation of political communication continued in 2012, when candidates’ debates were streamed live to computers and mobile devices for the first time.

As informal word-of-mouth contacts via social media sites becomes pervasive, more information exchange occurs via social media sites than via elite news sources. Among findings of the 2012 Pew Internet and American Life Project surveys of digital politics are that more Americans now obtain their news from Internet sources than from print and electronic media; 69 percent of online adults in the United States are active users of social media, and 66 percent of these employ online tools to communicate about civic and political matters. Younger voters are especially impacted by this shift in sources and forms of political news. The conflation of “objective” reporting, subjective impressions, parodies, satires, and outright deceptive message-generating practices creates new attitudes toward the democratic process, both humanizing and distorting perceptions of its actors and, early research shows, may be increasing both political cynicism and political engagement among younger voters.

Dual Processing and Online Politics

Research in human reasoning has posited that people tend to process information via one of two mental channels: centrally, with focus and logical concentration, or peripherally in a nearly automatic way, using heuristics or rules of thumb. People are likely to view Web content using peripheral processing. As Internet content is generally uncontrolled, its message-generating capacity is easily abused, especially as people are not likely to be closely scrutinizing the information they are receiving. Critics of the user-driven, bottom-up information flows in Web 2.0 believe that false consensus or pluralistic ignorance may drive public policy decisions and election outcomes.

A 2006 study of a cable news show hosted by comedian Jon Stewart coined the phrase *The Daily Show Effect* to describe the impact upon viewers of political parodies. Findings included negative impressions of both candidates, increased cynicism about the political process but increased confidence in their ability to sort through and understand public policy issues. A study of Tina Fey's 2008 *Saturday Night Live* impression of Sarah Palin found attitude changes among those who viewed it. The word *truthiness* was coined in 2005 by Comedy Central pundit Stephen Colbert and, in being named Word of the Year by the American Dialect society, was defined as "the quality of preferring concepts or facts one wishes to be true, rather than concepts or facts known to be true." While some online communication strategies are clearly designed as humor, and some (such as YouTube videos from sites like The Fake News Network) may be meant as parody, there is a likelihood that some users will not get the joke. Other studies of political humor cited findings that Colbert's satirical treatment of conservative talk show hosts leads some respondents to agree with the conservative viewpoints he implicitly pokes fun at.

Social Media and Political Skullduggery

Other Web tactics clearly fall into the dirty tricks category. These include fake Twitter feeds; fake or paid Twitter followers; fake spam messages; election malware embedded in political Web sites; and decoy election Web sites, some of which attempted to scam users in the 2012 cycle.

Some look-alike decoy election sites that pose as fund-raising arms of the major parties are actually

siphoning funds collected into the bank accounts of the individuals who constructed the site. Two such sites identified by news sources as fund-raising scams were DemocraticNationalCommittee.org and RepublicanNationalCommittee.org. The September 21, 2012, broadcast of *ABC News With Diane Sawyer* reported that the owner of these two domain names is a Massachusetts truck driver who operates dozens of similar sites. Because he owns the domain names and posts a small disclaimer on the sites, the site developer claims that his actions are legal. Neither party was aware that the look-alike Web sites existed until ABC News contacted them. The sites were rerouted shortly after the ABC News report.

Another form of decoy content on social media are election Web sites that use forum software and anonymous domain registrations to generate discussion among genuine supporters of a candidate along with sham supporters who make inflammatory remarks that take the genuine supporters' positions to extremes. Early examples discussed in a Wired News report of November 6, 2007, included RudyGiulaniForum.com, MittRomneyForum.com, and FredThompsonForum.com. The Thompson forum was suspected as being driven by Ron Paul supporters.

These decoy forums often include links to YouTube videos that further denigrate the candidate. Those who are familiar with the actual rhetoric of the candidate and her or his supporters can differentiate between real and fake posts. However, in accordance with the peripheral processing mode that most people utilize in perusing online material, fact-checking seldom takes place. Many can miss the fakery and, taking it as gospel, send it forward through their networks, with the more sensational messages going viral. The use of forum links to generate spam often uses the opponent's name in the hot type and enhances both the virility of the message and its placement high on search engine results when the candidate's name is keyed in.

Researchers at the Indiana University School of Informatics and Computing studying information diffusion and opinion dynamics in networked online content have identified a form of political spam that they call political astroturf. Under the guise of grassroots organizing online, a single entity generates a campaign via Twitter and other social media that can be used to

spread disinformation to undermine competitors' campaigns. Such information flows can go well beyond the original online venues. In cases where tweets are retweeted and go viral, mainstream news media may pick up the story and generate it further. In their report to the Fifth International Association for the Advancement of Artificial Intelligence (AAAI) Conference on Weblogs and Social Media, the researchers presented an example from the 2010 midterm elections where inflammatory wording in a tweet relating to the use of stimulus funds for a study of drug-addicted macaques generated a viral coke monkeys meme.

Whether political speech on the Internet should or can be controlled is a growing issue. Anonymity is a key component of these discussions. While courts have found that the First Amendment protects anonymous political speech and activity for those conducting those activities in the actual world, the protection of anonymous speech in online venues has not been secured and remains open for judicial review. Legislation to ban anonymous online speech has been introduced in a number of states, including California and New York.

Deep Packet Inspection

Deep packet inspection is a refinement of the firewall technique that allows a third party to block or examine packetized information as it travels over a network. One way that the Internet succeeds in quickly transmitting data is by breaking information into small blocks of information known as "packets." A typical packet contains about 500 bytes of data, not including the header information used to address and monitor the packet; the maximum Ethernet packet is 1,518 bytes. In practical terms, this means that a short, text-only e-mail would be split into five to 10 packets when it transverses the Internet, while a low-resolution photo would be split into 200 to 500 packets. A basic Web page with graphics could be around a megabyte in size, requiring as many as 2,000 packets, and an hour voice over Internet protocol (VOIP) call would be 10 times that much.

In what is now called shallow-packet inspection, a packet's addressing information is checked to see whether the source or the destination of the packet meets with the approval of the network administrator. This kind of technology was used for the first Web filtering, but it was rather crude; network administrators were able to block entire domains, such as YouTube.com. In addition, if all a network administrator wants to do is block certain kinds of packets (e.g., a telecom that wants to stop customers from using VOIP), or block the originator or sender of a packet (e.g., a government that wishes to stop communication between its citizens and an offshore dissident group), then a standard firewall will be sufficient. However, this is increasingly too crude of a device.

With shallow-packet inspection, it would be more difficult to block specific videos. As large content providers came to dominate the Web, a new technology was needed to see what a user was sending. This was not easy; packet headers

contain standardized addressing information that is easy to decode, while the information each packet contains may be in any variety of formats, and is likely only a snippet of the entire message.

In 2005, Thomas Porter reported that major networking providers (such as Microsoft, Cisco, Checkpoint, Symantec, Nortel, SonicWall, NAI, and Juniper/Netscreen) had begun to develop systems that look at the contents of each packet, including the address information but also reaching into the data each packet sends, before a decision is made to send the packet to its destination. In 2009, the *Wall Street Journal* reported that the Iranian government had set up a sophisticated deep packet inspection system, causing Internet users to experience extremely slow response rates. More recently, in 2012, the administrators of the Tor service noticed that the Ethiopian Telecommunication Corporation began to employ deep packet inspection based on its observation of its users, joining China, Iran, and Kazakhstan in this practice.

Delicious.com

Delicious.com was founded by Joshua Schachter in September 2003 as a social bookmarking application. It is a free service that was designed to allow users to keep track of bookmarks by

uniform resource locator (URL) address. The site was an extension of Muxway, a blog created by Schachter to keep track of links related to Meme-pool, a cooperative site that included links to interesting items on the Web. Originally dubbed del.icio.us, the site represented a domain hack that took advantage of the newly launched .us Web address. The site was renamed delicious.com in 2007.

The goal of the Web site was to allow users to secure a single place where they could collect and showcase individual links to pages across the Web. The service didn't save the Web pages; rather, it stored the URL address to the pages along with descriptions and tags. The service allowed users to edit the URL address and title and to add notes for additional descriptions and information about the bookmark.

Although other bookmarking services had been around since 1996, Delicious was different because it pioneered the use of tags. Tags are short key words that users developed to categorize and locate links again. These tags allowed users to organize their bookmarks by topic by assigning nonhierarchical key words, which provided an overview of information on the referent site without having to access the site itself. Tags could be created using freely chosen index terms or chosen from a list of drop-down words. Originally, multiple tags were space separated, so multiword tags were written as run-on words (such as *socialmedia* instead of *social media*). Now, tags are comma separated, but the old run-on words are still used. The popularity of the site led to the creation of online communities that developed shared vocabularies around these tags, known as *folksonomies*.

The Web site allows bookmarks to be stored publicly—so other users can see them—or privately. With the focus on public bookmarks, the site encourages others to add, annotate, and edit public bookmarks and tags. Users are able to search through collections of other users to discover new things, and a combined view of all bookmarks with a given tag is available. The Web page allows users to follow not just particular topics but specific users or specific tags by other users. Following topics, tags, or users allows users to see new links posted on the site. By subscribing to multiple tags, users are provided with automatically updated lists of relevant bookmarks. Many

credit the social aspect of Delicious as a reason for its success.

While public bookmarks are an important part of Delicious.com, there are options for private bookmarks. To keep an item private, users need to specify the bookmark as private when saving or editing. In addition, any bookmarks imported from Web browsers are private by default but can be made public. The ability to import links from personal computers enables new users to start with an established set of bookmarks and allows users to access the same bookmarks from any computer.

Although the site was launched in 2003, Schachter maintained separate employment until March 2005, in time for the firm to receive \$2 million in funding from Union Square and Amazon.com in April. In December 2005, Delicious.com was bought by Yahoo! for a rumored \$15 million to \$30 million. And by 2008, the bookmarking service had more than 5.3 million users and supported 180 million unique bookmarks.

In April 2011, Yahoo! sold the domain to AVOS, a company founded by Steve Chen and Chard Hurley, the original founders of YouTube. AVOS redesigned the sight and relaunched it in September 2011 to help mitigate information overload. The redesign came as a surprise to many users and brought a great deal of criticism. Critics charged that many of the features were disabled, removed, or temporarily unavailable. And, although the company provided multiple reminders to export and back up bookmarks, many users found their bookmarks deleted in the switch.

AVOS sought to counter some of this criticism by creating stacks, which allowed users to group together links with similar topics. Stacks could be worked on collectively, publically, or privately within groups. In addition, users could create their own stack in response to stacks created by others. Delicious users felt this new format was too closely mimicking pinboards (such as Pinterest), and the feature was discontinued in August 2012. AVOS continues to try to appease its member base and announced smartphone applications and a new redesign that features faster loading and better search features in January 2013.

Demand Progress

Demand Progress is a political advocacy organization that seeks to promote progressive policies and candidates in the United States. It was founded in 2010 and claims over 1 million members. It has an especially strong voice on issues of open access to information, censorship, and regulation of the Internet. Its self-proclaimed mission is to promote civil liberties, civil rights, and government reform. As such, it has taken on a number of positions opposing various prospective laws that would criminalize some types of online information sharing along with similar measures. Aaron Swartz, its late founder, is also the inspiration for its current support of a law to decriminalize the violation of Internet service provider agreements and to reclassify them as civil matters.

Historical Background and Campaigns

Swartz founded Demand Progress as an outgrowth of his earlier work in providing easy public access to public documents through initiatives like his public.resource.org and his even larger project called Open Library, which sought to make information about every book ever published available online. Rather than limiting itself to online petitions and

publicity campaigns, Demand Progress has directly engaged in fund-raising efforts to support politicians who are friendly to its causes and to bring pressure to bear on lawmakers who are voting on legislation that affects its core values.

To date, Demand Progress has led a number of campaigns that have been successful in drawing wide attention to potential government overreach and abuse of secret information. It has been active in publicizing legislation such as the Protect Intellectual Property Act (PIPA), the Stop Online Piracy Act (SOPA), and the Cyber Intelligence Sharing and Protection Act (CISPA).

Other related efforts include the “You’ve Been Owned” campaign, which raised awareness of the potential impacts of the October 2012 case *Kirtsaeng v. John Wiley and Sons*. Unlike the online security legislation it had previously opposed, this judgment would have impacts in both the digital and material landscape. In essence, John Wiley and their supporters argued that individuals should not be able to resell used intellectual or copyrighted material, including books, music albums, and countless other items.

Aside from the obvious threats to Web sites like eBay, this case would have potentially made it a crime for people to engage in a host of long-standing practices like selling used items from home, lending films or books to friends, and so on. Being

a court case there was no means of bringing direct pressure to bear on justices, but Demand Progress mobilized its supporters in order to bring the indirect pressure of public awareness to the case. Interestingly, in addition to the usual social media viral efforts its campaigns typically employ, Demand Progress also created entertaining cartoons to explain the ruling’s relevance and to serve as a public education resource.

Current Campaigns

There is a high degree of continuity in the issues targeted by Demand Progress. One of its prominent political allies, U.S. Representative Zoe Lofgren of California, is spearheading efforts to support work that honors Swartz’s legacy. The so-called Aaron’s Law has been proposed as both a tribute to Swartz and as an effort to counterbalance what the organization sees as heavy-handed tactics used to prosecute open information advocates. Specifically, it changes the Computer Fraud and Abuse Act so that violation of an individual Web site’s terms of agreement or user agreement would no longer be classed as a felony, with corresponding lengthy prison sentences. It is the prospect of such a long custodial sentence that is supposed to have been a key motivator in Aaron Swartz’s suicide.

Another central campaign is “The Internet versus Hollywood.” Its claim is that after the failure of PIPA/SOPA legislation, the motion picture industry continues to try to criminalize uploading user-purchased materials to cloud computing sites. Specifically, it has filed a legal brief on behalf of Kim Dotcom, the operator of the Web site Megaupload.com, who has been charged with intellectual property and copyright violations as his site has been used to distribute these materials by others. According to Demand Progress, the implication that a site operator could be held liable for acts committed by site users is potentially catastrophic for any Web site that relies on user-uploaded content, including even well-known sites like YouTube. Taken to extremes, it argues the logic could even extend to online e-mail services that millions of people rely upon.

Because of the genuine possibility that Megaupload could be reasonably held liable for at least providing controls on uploaded content, the Demand Progress effort to generate petition

A protester at a January 18, 2012, event organized by the New York Tech Meet Up, which featured Demand Progress founder Aaron Swartz and others speaking against the Protect Intellectual Property Act (PIPA) and the Stop Online Piracy Act (SOPA).

signatures to send to the judge on the case specifically focuses on the government seizure of files and information belonging to people who used Megaupload and related sites and who now have no way of retrieving their personal files. In other words, it appeals to the long-standing principle that personal property cannot be seized without probable cause and specific legal sanction.

Demand Progress is also involved in a nonlegal campaign against major U.S. Internet service providers (ISPs) that are implementing a “six strikes” plan to cut down on copyright infringement and similar problems. Rather than using legal means, these firms will simply restrict or deny Internet access to users who have been accused of violating copyright. The objections of Demand Progress center on the lack of a means to contest accusations without paying a fee, the ambiguity of how and when the rules will be applied, and the likelihood that most terms will be buried in the fine print of user agreements and thus not clearly understood by customers.

Other Progressive Campaigns

Though the majority of its efforts have focused on Internet issues, Demand Progress has also engaged in initiatives that are in the wider stream of progressive (leftist) politics. These have included a campaign to end indefinite military detention at places like Guantanamo Bay; an effort to have state legislatures amend their constitutions to create a national popular vote for the U.S. presidency; and support for Lawrence Lessig’s Grassroots Democracy Act, which would create vouchers to fund political campaigns for politicians who exclusively use public funding and small donations and allow organizations to aggregate smaller amounts into large donations that would theoretically reduce the influence of the wealthiest citizens and corporations on the political process.

DeMint, Jim

Jim DeMint has served in the U.S. Senate from South Carolina. Elected in 2004, DeMint is arguably one of the most prominent conservatives in the Senate. He is an economic and social conservative opposed to abortion, gay marriage, and pork barrel spending. DeMint is considered one of the leaders of the Tea Party movement in Congress. Recently, DeMint shocked political insiders by announcing that he was leaving the Senate in January 2013 to serve as the president of the Heritage Foundation.

James Warren DeMint was born in 1951 in Greenville, South Carolina. He attended the University of Tennessee, where he received his bachelor’s degree, and Clemson University, where he graduated with his master’s in business administration. After college, DeMint founded a marketing research firm.

In 1998, DeMint was elected to the U.S. House of Representatives from South Carolina. He was reelected in 2000 and 2002 and established his reputation as an economic and social conservative.

In 2004, DeMint was elected to the U.S. Senate from South Carolina. He quickly took conservative stands on abortion, gay marriage, pork barrel projects, and government spending. He blocked thousands of pork barrel projects. He is frequently described as the most conservative member of the Senate. In 2007, the American Conservative Union gave DeMint a “perfect” rating.

In 2009, DeMint became an enthusiastic supporter of the Tea Party movement. The movement’s opposition to President Barack Obama’s stimulus package and health care plan and vision

of a limited government reflected DeMint's conservative views. He is usually considered one of the movement's leaders.

In 2010 and 2012, he sought to recruit conservative candidates in Senate races. These included Sharron Angle in Nevada, Christine O'Donnell in Delaware, Ken Buck in Colorado, Richard Murdock in Indiana, and Todd Akin in Missouri. Some of the candidates DeMint supported—such as Marco Rubio in Florida and Pat Toomey in Pennsylvania—won their respective races. Supporters admired DeMint's attempts to hold the Republican Party true to what they perceived to be its core principles. On the other hand, critics lamented the fact that most of the conservative candidates endorsed by DeMint lost. They argued that these candidates were too radical for their respective electorates and that more moderate Senate candidates would have won and resulted in Republican control of the Senate in 2010 or 2012. Instead, conservative candidates like Richard Murdock and Todd Akin made controversial statements about rape and abortion, and Republicans missed the opportunity to regain control of the Senate.

DeMint easily won re-election in 2010, receiving 61 percent of the vote. In the Senate, DeMint served on a variety of committees, including the Foreign Relations Committee; the Banking, Housing and Urban Affairs Committee; and the Commerce, Science, and Transportation Committee.

Heritage Foundation

On December 6, 2012, Jim DeMint shocked his Senate colleagues and political insiders when he announced that he would resign from the Senate in January 2013 to accept a position as president of the Heritage Foundation. DeMint contended that he would have more influence over the conservative movement as president of the Heritage Foundation than as an individual senator from South Carolina. Some conservatives praised the decision as a brilliant move on DeMint's part, while other conservatives condemned DeMint for deserting the movement. Some observers noted that DeMint's decision might have been motivated by monetary factors. They pointed out that DeMint's assets were valued at only \$69,000—unusual in a body famous for its millionaires. While DeMint is leaving the Senate, he will likely

play a significant role in the conservative movement for years to come.

Democracy Now!

Democracy Now! is a national, nonprofit, independent radio and television news program that broadcasts around the world. The program, broadcast by Pacifica Radio, is the largest public media collaboration in the United States. One of the principal goals of *Democracy Now!* is to provide its listeners access to people and perspectives that are often not available in the dominant, corporate-sponsored media in the United States.

History

Democracy Now! was founded in 1996 by Amy Goodman, Juan Gonzalez, Larry Bensky, Salim Muwakkil, Julie Drizin, and Denis Moynihan.

Amy Goodman is the core creator and principal host of the program, with Juan Gonzalez as a consistent cohost. Goodman was previously the producer of the evening news on Pacifica Radio's New York Station, WBAI, and gained international recognition and a number of awards for her groundbreaking coverage of the U.S.-backed Indonesian occupation of East Timor and associated public massacres.

On February 16, 1996, *Democracy Now!* completed its first broadcast and became the only daily election show in broadcasting. The show became so popular that public demand led to the daily program continuing beyond the elections, which quickly became Pacifica's flagship news and public affairs program.

In 1998, Goodman and Jeremy Scahill, an early contributor and producer, traveled to Nigeria to investigate the drilling activities of U.S.-based oil companies in the Niger Delta. Goodman and Scahill then produced the radio documentary "Drilling and Killing: Chevron and Nigeria's Oil Dictatorship," which investigated allegations of Chevron's role in the murder of Nigerian civilians who were protesting the frequent oil spills that decimated their communities. The documentary won the 1998 George Polk Award.

In 1999, Goodman traveled to Peru to interview American prisoner Lori Berenson, where Goodman was the first journalist to be admitted into the prison to speak to Berenson. Later that year, *Democracy Now!* did extensive coverage of the World Trade Organization (WTO) protests in Seattle, Washington, also known as the Battle of Seattle. Extensive coverage of the protests in the streets was paired with interviews and coverage of the discussion and significant events taking place in the actual WTO meetings.

Democracy Now! orchestrated a unique multimedia collaboration to cover the 2000 presidential election. Distribution included satellite and cable television, nonprofit community radio, and the Internet. The shows were live, two-hour daily specials at the Republican and Democratic national conventions, broadcast directly from independent media centers in Los Angeles and Philadelphia. Then, on Election Day in 2000, Amy Goodman and Gonzalo Aburto conducted an impromptu interview with Bill Clinton during which they asked challenging questions that the president was

not accustomed to hearing. The interview marked one of the few times during the election that the public was able to hear hard-hitting questions, and Clinton called the questioning "hostile," and "combative," and at times "disrespectful." Goodman said she was "just doing her job."

Democracy Now! began its daily weekday television broadcast shortly after September 11, 2001, and became an independent nonprofit organization in June 2002. Highlights since 2002 include extensive coverage of the buildup before and operations during the wars in Afghanistan and Iraq; in-depth analysis of the 2004, 2008, and 2012 political conventions and national elections (during the 2008 Republican convention, several staff were forcefully arrested, leading to public outcry and a lawsuit against the cities of St. Paul and Minneapolis, Minnesota); in-depth coverage of the Troy Davis execution; the 2008 financial crisis and the Occupy Wall Street movement; as well as a wide-ranging list of national and international issues.

Democracy Now! is as of December 2012 the only public media program in the United States that airs simultaneously on radio, satellite and cable television, and the Internet. The program continues to cover critical news and social justice issues around the world, many of which receive little to no coverage in the corporate news media. As such, *Democracy Now!* is widely seen as one of the most important and valuable sources for news.

Reach and Role

Democracy Now!'s broadcast is carried on more than 1,000 public radio and television stations, making it the largest media collaboration in the United States. The program is broadcast on Pacifica Radio, National Public Radio (NPR), community and college radio stations, public access TV channels, some public broadcasting systems, satellite TV channels, Free Speech TV and Link TV carried on both DISH and DirecTV satellite systems, and on the Internet as downloadable and streaming audio and video on democracynow.org and via podcast.

Democracy Now! plays a critical role in the news media landscape by offering an alternative to the main current news media industry, which is dominated by corporate, for-profit media conglomerates. Corporate news media is often categorized as threatening free press and democratic

processes because corporate media outlets in the United States are legally responsible to their shareholders to maximize profits. Ed Herman and Noam Chomsky point out several issues with for-profit corporate news media in their book *Manufacturing Consent*, in which they trace the routes by which money and power are able to filter the news, marginalize dissent, and allow the government and dominant private interests to dominate the messages that reach the public. The critical elements are a set of news filters that focus on the size, concentrated ownership, owner wealth, and profit orientation of the dominant mass-media firms and advertising as the primary income source of the mass media, among other selection biases and control mechanisms. *Democracy Now!* is able to avoid these filters by remaining an independent, nonprofit, commercial-free news broadcast funded entirely through contributions from listeners, viewers, and foundations. *Democracy Now!* does not accept advertisements, corporate underwriting, or government funding.

Frequent and noteworthy guests on *Democracy Now!* include (not a comprehensive list) Jeremy Scahill, Sharif Abdel Kouddous, Norman G. Finkelstein, Cornel West, Dennis Kucinich, Howard Zinn, Michael Moore, Naomi Klein, Noam Chomsky, Ralph Nader, Jeff Cohen, Danny Glover, Matt Taibbi, Paul Krugman, Alan Dershowitz, Alan Greenspan, Arundhati Roy, Bill Clinton, Bill Moyers, Edward Said, Evo Morales, George McGovern, George Papandreou, Gore Vidal, Hugo Chávez, Jean-Bertrand Aristide, Jimmy Carter, Joseph Stiglitz, Julian Assange, Lori Berenson, Mahmoud Ahmadinejad, Mumia Abu-Jamal, Yoko Ono, and Lou Dobbs.

Democracy Now!, including Amy Goodman and other staff, have won a myriad of awards for their contributions to journalism and news media, including the Right Livelihood Award (often referred to as the Alternative Nobel Prize), the Gandhi Peace Award, the Park Center for Independent Media Izzy Award (three times), the ACLU-NCA Henry W. Edgerton Civil Liberties Award, the Paley Center for Media She Made It Award, the Gracie Award for American Women in Radio and Television Public Broadcasting, the James Aronson Award for Social Justice Journalism, the Puffin/Nation Prize for Creative Citizenship, the Ruben Salazar Journalism Award, the George

Polk Award, the Robert F. Kennedy Memorial Prize, the Alfred I. duPont-Columbia Award, the Electronic Frontier Foundation Pioneer Award, and the Golden Reel from the National Federation of Community Broadcasters, among many others.

Democracyfor America.com

Democracy for America (DFA) is a nationwide grassroots organization of more than 1 million people. Officially classified as a political action committee (PAC), DFA pursues progressive political reforms within the Democratic Party as well as the nation as a whole. Founded in 2004 by former Democratic presidential candidate and Democratic National Committee (DNC) chair Howard Dean, DFA provides campaign training, organizing resources, and media exposure so members can support progressive issues and candidates up and down the ballot. DFA also sponsors public educational venues for various issues and makes donations to candidates running for office.

Initially formed by Dean in 2001 as the Fund for a Healthy America PAC, the group was renamed Democracy for America in early 2004. After failing to win the Democratic nomination for president

later that same year, Dean sought to build grassroots support for various Democratic candidates through the DFA. Headquartered in South Burlington, Vermont, DFA endorsed Democrats running for office at all levels of government in 2004. After ascending to the DNC chairmanship in 2005, Dean relinquished control of the PAC to his brother, Jim Dean. Since then, DFA has supported some 600 candidates in their successful campaigns for office, including President Barack Obama.

As a PAC, the DFA can accept up to \$5,000 in donations per individual or PAC, but it cannot take contributions from corporations or unions. In accordance with government regulations, the DFA reports to the Federal Election Commission (FEC) the identities of its donors. From the start, the DFA has concentrated its efforts primarily on candidate endorsements and sponsorships of training academies for grassroots activists, campaign staff, and candidates (in contrast to large TV advertising campaigns). Members of the DFA, from both local and national levels, take part in these programs in order to learn how to conduct winning political campaigns. The foremost training program within the DFA is the Campaign Academy, which involves two day-long workshops on campaign operations for candidates, staff, and activists. Various sessions, led by professional campaign personnel, cover the full range of campaign activities—from fundraising to voter turnout to social networking—in order to build a nationwide, grassroots organization of progressive activists possessing the skills necessary for competing effectively in elections.

The DFA also runs a free online training program called Night School that involves video Web-conferencing seminars. These hour-long, interactive sessions allow individuals to converse with professional trainers and learn about a variety of campaign-related topics. Through such exchanges, participants can ask questions and glean campaign materials right from their own homes. In addition, the DFA grants scholarships to liberal bloggers via a program called the Netroots Nation Scholarship.

The DFA's Campaign Academy and Night School are complemented by a social networking mechanism known as the DFA Community. This setup allows DFA members to identify and meet with other progressives in their locales as well as organize groups and plan events. Members

normally gather together once a month in groups across the nation, carrying out goals set at the national level. These local groups, however, are independent and not formally associated with the national organization. The DFA Community has a presence in all 435 congressional districts and involves more than 600 online groups. Local members' support for certain political candidates can serve as a guide for the DFA in determining whom to back. In addition, the DFA considers endorsements made by local groups in order to gauge member support for various candidates.

Universal health care was the center of attention for the DFA after the 2008 presidential election, specifically a single-payer system through the U.S. government. This position is more liberal than most Democratic officials' stances at both state and national levels. Although candidates in the Democratic Party frequently receive endorsements and campaign support from the DFA, the organization differs with the official party line on a variety of issues, including the legalization of same-sex marriage (which the DFA favors). The DFA also was against the Don't Ask, Don't Tell military policy, sending an open letter—with the signatures of 100,000 members—to President Obama and all 100 U.S. Senators in 2010. The dispute in Wisconsin over labor union rights was a prime focus for the DFA in 2011, and the DFA continues to fight against state voter identification laws, arguing that certain groups—particularly minorities, seniors, and the disabled—are disproportionately affected and thus disenfranchised.

Demonstrations, Organizing

Contentious politics is rooted in a set of consolidated action repertoires, with demonstrations being the most widespread protest tactic. Among the most powerful images of 2011 and 2012 are the pictures of thousands of people demonstrating in Tahrir Square (Cairo, Egypt), Zuccotti Park (New York City), and Puerta del Sol (Madrid, Spain). However, citizens have been organizing demonstrations long before the advent of social media, at least since the 19th century. What has changed is the way people organize collective action, and the range of media and technology that support them in these operations.

Demonstrations play two fundamental roles within social movements: they are instrumental in conveying the contentious goals of a movement, and, at the same time, they contribute to sustaining and reproducing the movement itself. Demonstrations, in fact, provide activists with an occasion to build and consolidate a collective identity, establish networks of communication and exchange, and create a community. Traditionally, demonstrations have been organized through word of mouth, as well as communication channels like the telephone, the fax machine, and, more recently, Internet and e-mail. How did the advent of social media and mobile devices change the way people organize demonstrations, and how do they contribute to shape contention repertoires? How are collective identity and movement creation and reproduction influenced in this process?

Impact of Social Media

The influence of social media and mobile devices on demonstration organization can be traced primarily on two levels, one external and one internal to the movement. On the external level, social media have an impact on the diffusion of

repertoires of action across different national contexts and thematic settings. On the internal level, one can distinguish two further spheres of influence of social media: first, on the organizational processes of collective action, specifically on how people organize protest events, take to the streets, and network with other groups; and, secondly, on collective identity, that is to say the mechanisms and practices through which people motivate themselves to take action and recognize each other as part of the same struggle.

Observers have mixed views about the impact of social media on organized collective action. The debate on the topic, in particular on account of the 2011 protests, has developed along the dichotomy techno-optimism versus techno-skepticism. For some, Facebook and Twitter are behind the new wave of contention, and they have made obsolete everything we know about people's participation in politics and social movements; organized collective action from now on will emerge online. For others, social media are unable to originate the strong ties that are needed for radical and massive mobilization; digital social networking promotes individual rather than collective action, while at the same time social media offer new and efficient tools for state monitoring. Some observers have used the label "slacktivism" in order to describe online political activities performed with minimal effort, which tend to make participants feel good about themselves but are not very efficient in achieving the stated political goals.

Both positions find partial confirmation in the most recent waves of mobilization. In the so-called Arab Spring, for example, scholars Philip Howard and Muzammil Hussain write that digital social media were

. . . singularly powerful in spreading protest messages, driving coverage by mainstream broadcasters, connecting frustrated citizens with one another, and helping them to realize that they could take shared action regarding shared grievances.

They continue:

[T]he precise grievances have varied significantly from country to country. Yet the use of

digital media to rouse and organize opposition has furnished a common thread.

But empirical analyses of Egyptian protests show that online social networks were primarily used as a platform of solidarity among upper-middle-class English-speaking activists and as “a key resource for getting information to the outside world, perpetuating the feeling that the world was watching, which was an important factor for morale and co-ordination on the ground,” according to Christopher Wilson and Alexandra Dunn, rather than to organize protests.

Analysis

The 2011 protests have encouraged a more nuanced analysis of organized collective action in times of social media. Some scholars have focused on the actual practices of organizing demonstrations, with the aim of understanding the

interaction among digital social media, the different forms of movement organizations, and the physical and geographical spaces of contention and the different cultures, both referring to the use of communicative tools and to the organizational structure of mobilization, that are embedded in different experiences of collective action.

Looking at the reciprocal influence of social media and organizational cultures, scholars have observed how in the Arab Spring, the Spanish 15M, and Occupy Wall Street the use of social media has contributed to shape the repertoire of action and the structural organization of movements. Scholars W. Lance Bennett and Alexandra Segerberg, embracing techno-optimism, define “digitally networked action” as those instances of political participation and protest built on “personalized communication” rather than on organized groups. Digitally networked action is characterized by a set of “inclusive [...] personal action

Occupy Wall Street protesters at a General Assembly meeting in Washington Square Park in New York City on October 15, 2011, display their approval through hand signals adopted by organizers. October 15 was a global day of protest under the banner “United for Global Change” in 950 cities in 82 countries; organizers spread the word online using many different types of social media.

frames” shared via social media. In this process of individualization of protest, the new “logic of connective action” overcomes traditional social movement schemes; however, the two coexist, resulting in hybrid forms of protest. At the core of this hypothesis is the idea that social media, providing immediate access to information, and therefore to calls for action and available repertoires of contention, have the ability to enhance the personalization of protest, attributing to the individual citizen-protester direct agency in the mobilization, at the expense of existing organized activist groups.

In his research on Occupy Boston, Jeffrey Juris has found empirical support to this observation, even if he does not share in full Bennett and Segerberg’s techno-enthusiastic perspective. Focusing on the interaction between media practices and organizational cultures, Juris argued that the activists’ adoption of specific communication tools has the ability to strengthen as well as weaken some of the organizational models proposed by the different groups in a movement. He observed how “the increasing use of social media such as Facebook or Twitter has led to new patterns of protest that shape movement dynamics beyond the realm of technological practice.” Further, “rather than generating organizational networks, social media primarily operate via interpersonal networks, resulting less in ‘networks of networks’ than in ‘crowds of individuals.’” In other words, social media enhance the “logic of aggregation” in a way similar to how the Internet has fostered a “logic of networking” within the global justice movement.

Scholar Paolo Gerbaudo shares with Juris the focus on the interaction among social media, organizational cultures, and physical space, but his analysis moves away from the techno-optimist position. What for Juris is the “logic of aggregation,” that is to say the capacity of social media to bring together in the same physical space and in the same act of demonstrating a wide group of individuals with different backgrounds and goals, for Gerbaudo is the “choreography of assembly,” in other words “a process of symbolic construction of public space which facilitates and guides the physical assembling of a highly dispersed and individualized constituency.” In this setting, “influential Facebook admins and activist tweeps

become ‘soft leaders’ or choreographers, involved in setting the scene, and constructing an emotional space within which collective action can unfold.”

From this point of view, the influence of social media in the organization of demonstrations is not only technical, but it deeply restructures the way in which people participate in acts of protest, even if not in the way that supporters of the principles of “horizontalism” and “leaderlessness” would think. Gerbaudo offers the examples of MeetUp, “informing users about ‘offline’ meetings they might be interested in”; Doodle, a Web-polling “application used to schedule meetings and other appointments; and of course the popular Facebook Event function, used to invite people to various activities.” These services, contends Gerbaudo, “are testament to the extent to which the assembling of social groupings in our fragmented and dispersed societies relies on a complex process of symbolic and technical mediation.”

Social Movement Media Cultures

The influence of digital media over mobilization is culturally mediated at different levels: it interacts not only with organizational cultures, but also with “social movement media cultures,” as Sasha Costanza-Chock has found in his research on Occupy Wall Street. Costanza-Chock argued that the movement, in terms of media practices, is “complex and internally differentiated, rather than a mass of digitally savvy youth with laptops and smartphones.” Different media cultures, shaped by “previous histories of movement media practices, as well as key individuals with past experience as movement communicators” inform the way in which different activists use digital media.

The widespread accessibility of social media has challenged, transformed, and reshaped the role of media activists, without eliminating it. In fact, while the use of Facebook is almost ubiquitous within Occupy protesters, “media, tech and press WGs composed by small numbers of relatively highly skilled, more experienced movement actors play key roles in creating, curating and circulating media texts, as well as in shaping the media culture of the movement.” In this process, the media cultures of contemporary movements interact with the legacy of past struggles for free culture and digital commons, even if it is still too soon

to assess the level of continuity and hybridization that this interaction will produce and to identify a new established movement media culture.

Diffusion of Action

Social media also influence the diffusion of action repertoires across national boundaries. People have seen the modular character of contention repertoires at work with antiausterity protests like the Occupy Wall Street mobilizations, which have been reproduced with varying degrees of success by different actors in various parts of the world. The same mechanism is being analyzed by scholars using similar hypotheses and different definitions: both Sidney Tarrow's concept of "thin diffusion" and the notion of "cloud protesting" aim at identifying in contemporary forms of protest an immediate exchange of symbolic content, such as slogans, tactics (think for example of the rapid diffusion of protest camps within the "global" Occupy protest), and protest know-how, well beyond the traditional channels of communication of social movements. Social media and mobile technology are at the core of such thin diffusion, which is nonetheless as powerful as the textbook "thick diffusion."

Department of Homeland Security Social Media Monitoring Initiative

In response to the growing ubiquity and pervasiveness of social media, in 2010, the U.S. Department of Homeland Security (DHS) created its Social

Media Monitoring and Situational Awareness Initiative (hereafter referred to as “the program”). The program’s initial mission was to monitor social media Web sites for evidence of emerging and credible threats to national security and to share and collect data about possible terrorism suspects and terroristic and criminal acts in planning.

The program’s first task was narrowly targeted at monitoring Web sites like Twitter and Facebook for commentary on three 2010 events: the Haitian earthquake; the Vancouver, British Columbia, Olympic events; and the Deepwater Horizon oil spill. This focus was subsequently expanded to include monitoring of numerous and disparate publicly available online forums, blogs, public Web sites, and message boards, as well as search engines and content aggregators. Sources of the derived information might originate from citizenry, the public at large, as well as first responders, the press, volunteers, and others. The categories of individuals who are eligible to have their data monitored expanded as well. They include the following:

- Any U.S. citizen or foreign individual whose information is of a potential life-threatening nature
- Any U.S. or foreign official (whether private or public sector) who speaks publicly for an organization
- News readers, reporters (regardless of media focus) who utilize their reporting capabilities to keep their audiences updated and informed on various phenomena or events
- Public officials (current or past) who have been victimized in incidents related to national security
- Individuals engaged in terror incidents, drug cartels, or other major crimes as determined by DHS, who are killed or found dead.

The program’s stated guidelines note that, in the course of monitoring, analysts and information compilers are not to post any information, seek out other users of the social media service or interact in any way with them, or accept any invitations to interact in any way. Personally identifiable information can include the individual’s

name; his/her affiliation, position, or title; as well as any identification that is publicly identifiable. Analysts are instructed to disregard information not belonging to these categories.

Once information of value is ascertained, it is extracted from the site and, utilizing a specific Web application, it then forms the basis of a report. DHS maintained that only user-generated information from publicly available social media sites is retained and that all unused information is discarded or deleted. All saved information becomes part of the federal record but is retained for no more than five years. By its own accounting, information derived from social media sweeps are wide-ranging (over 9,300 reported in one six-month period alone) but often innocuous (e.g., news stories about natural occurrences, power outages, tornadoes, floods, or fires, or Border Patrol apprehensions). Notwithstanding, DHS issues no assurances that it will not seek more robust and sophisticated tools to mine the Internet for what it views as threats to national security. This wide scope has alarmed privacy advocates, who, through a series of legal maneuvers and public disclosures, have sought to, at the very least, curtail the scope of the program.

History

In 2010, the DHS Privacy Office approved the initiative aimed at monitoring social media Web sites for what DHS believes are emerging threats to national security. The DHS Privacy Office was created by the U.S. Congress in 2003 as a component of the Homeland Security Act of 2002 (PL 107–296, 116 Stat. 2135), specifically Section 221 and 222 of that act. Under the supervision of the chief privacy officer, the Privacy Office is tasked with reviewing major initiatives of the agency to ascertain whether citizens’ right to privacy is respected when planning or updating any program, system, or initiative, while, at the same time, ensuring that DHS has the ability to effectively collect and share information about potential or ongoing threats to national security. DHS’s Privacy Office was the first statutorily required privacy office in any federal agency and is responsible for evaluating DHS programs, systems, and initiatives for potential privacy impacts, and providing mitigation strategies to reduce the privacy impact. Furthermore, when privacy complaints or

violations are alleged, the Privacy Office is tasked with responding to those complaints and, if necessary, provides redress by ordering additional training, education, and public outreach in order to encourage departmental transparency.

As its guide, the Privacy Office purports to use DHS's Fair Information Practice Principles (FIPPs) as its policy framework in order to enhance individuals' privacy protections by assessing the nature and purpose for all personally identifiable information (PII) collected in the service of fulfilling DHS's mission. The eight FIPPs—transparency, individual participation, purpose specification, data minimization, use limitation, data quality and integrity, security, and accountability and auditing—are a set of principles that rest at the heart of the Federal Privacy Act of 1974 [PL. 93-579] and are highly influential in the crafting of privacy laws in many U.S. states as well as other nations.

DHS developed the program very much out of the public eye. Only after DHS was sued under the Freedom of Information Act by the Electronic Privacy Information Center (EPIC) did details about the program emerge into public view. In two contentious meetings on February 15, 2012 (one public and one classified), DHS officials were called before the Subcommittee on Counterintelligence and Intelligence headed by Rep. Patrick Meehan (R-PA) to explain the depth, ubiquity, goals, and technical capabilities of the program. During testimony, DHS revealed that the agency had outsourced the program without competitive bidding to General Dynamics, a major defense contractor located in West Falls Church, Virginia. As a condition of the contract, DHS noted that it required all General Dynamics employees to adhere to DHS privacy standards and to undergo training in handling PII. Furthermore, the agency noted that if General Dynamics employees misuse PII of journalists, public figures, or the general public obtained through monitoring of various social media (Facebook, Twitter, and a growing list of other unspecified Web sites), said employees will be directed toward additional training or dismissal from the program.

How the Program Works

To facilitate the program, General Dynamics and DHS engage in key word monitoring of various Web sites of interest, with particular attention

paid to social media. For example, the key word searches are used when scanning Facebook or Twitter because DHS is particularly interested in breaking news tweets and Facebook posts. The names, usernames, blog URLs, and other identifying information of "first responders" to these events are recorded for later analysis. The list of key words is dynamic, not static, but key words were initially selected by an unspecified commercially available software package and later customized by DHS. Some at the hearing questioned whether DHS was intending to keep dossiers on private citizens. In response, the agency denied this and stipulated that it regularly scrubbed its servers of nonrelevant information.

At the subcommittee hearing, DHS officials noted the department is merely fulfilling its mission under the Homeland Security Act to keep abreast of possible and credible threats to national security, and the program is an extension of other initiatives already in place with respect to monitoring traditional media. Furthermore, DHS argued that the program is legal because the agency forbids the wide-scale targeting of individuals (with some exceptions made for individuals in potential life-or-death situations, senior public officials or spokespeople making public statements, and members of the news media) and does not collect or catalogue PII. Privacy advocates argued that this last statement directly contradicts prior statements made by DHS on the collection of PII (even in the same hearing) as well as the contents of DHS's own report of the program, which contained portions of PII in commentaries, blog postings, and tweets from disparate sites.

Key Words

After its hearing before the subcommittee, DHS reluctantly released a redacted list of key words and phrases the program uses to monitor social media and other Web sites. DHS deems a search of any of the key words or phrases worthy of investigation for possible signs of terrorist activities or threats to national security. The key words were included in DHS's 2011 Analyst's Desktop Binder that was used to identify suspect media content.

Free Speech and Privacy

In response to the release of the list, EPIC characterized the words and phrases as broad, vague,

and ambiguous. EPIC and other advocates like the Electronic Frontier Foundation (EFF) are concerned that the actions of the program have the potential to violate First Amendment rights and the Federal Privacy Act of 1974 (PL. 93–579]. Specifically, privacy and free speech advocates worry that DHS seeks to have unfettered access to and use of individuals' and groups' PII (in violation of guidelines put in place by the Federal Privacy Act of 1974) and to monitor online dissent and criticism of the federal government by the press and others in order to chill free speech.

Illustratively, privacy advocates noted that the cache of documents released to them by DHS specified that, as part of its \$11 million contract, General Dynamics is expected to collect reports that criticize the handling of various events and phenomena by agencies such as the Central Intelligence Agency, the Federal Emergency Management Agency, Immigration and Customs Enforcement, Customs and Border Protection, and others. Within the documents released by DHS were the names of dozens of media outlets and publications that were being monitored such as the *New York Times*, *Computerworld*, *Wired Magazine*, *Drudge Report*, and *Huffington Post*. As a result, the privacy advocates argued that DHS's practice of surveilling social media and other Web sites (especially without independent guidelines and proper oversight) could lead to abuse and could discourage citizens from speaking out against the government.

The privacy advocates argued that concern should not only be for the actual content collected but also for the metadata behind it, as this allows federal officials to access a computer's identifying number (which can reveal the location of the individual, when the communication took place, and the identities of other unsuspecting parties). They noted, too, that other agencies are seeking to follow the lead of DHS by implementing their own social media surveillance. For example, shortly after the implementation of the program at DHS, the Federal Bureau of Investigation (FBI) initiated its own operation, a tool that alerts FBI officials to social media threats and harvests historical data from the Web that can later be searched and analyzed for content and location. As well, the Department of Defense (DOD) follows DHS in exploring how DOD can forecast how groups will behave based upon information culled from

message boards, chats, and postings on blogs, Twitter, Facebook, and more.

Privacy advocates are most concerned that regardless of assurances to the contrary regarding the purposes of the program, DHS activities could expand to all online speech with no reasonable suspicion that a crime had occurred and, as a result, degrade free speech and individual privacy as protected under the Federal Privacy Act of 1974. They noted that even DHS's stated framework for the program was fluid, particularly regarding the purposes for which the collected information would be used and which agencies would have access to it.

Finally, during the subcommittee hearings, it was noted by many journalists and members of Congress that there seemed to be little consensus among DHS officials as to the scale, scope, and overarching goals of the program. EPIC, EFF, and other privacy advocates have continued to urge DHS to make available its reports on the program. Despite DHS's assurances to the contrary, a particular worry is that DHS might target community activists, those engaged in controversial political issues, and those critical of DHS itself. DHS has been generally uncooperative in disclosing documents and other pertinent information about how the program operates. Privacy advocates have requested that Congress require that DHS suspend the program until the full scope of the program is revealed and privacy protections are developed and implemented by entities outside of DHS.

Developing Nations

As people in the developing world are gaining access to the Internet, they join social networks at a high rate. Facebook creators have envisioned particular strategies for attracting users in developing countries, and as such Facebook is becoming a popular social networking platform in such countries. Twitter is also growing in importance for developing nations, especially for sharing community-related information. People in the developing world often access the Internet and social networks through their cell phones, which provide a less expensive and more convenient option than fixed-line connections, and with ownership of cell phones rapidly increasing, particularly in Asia and Africa, Internet usage through mobile phones is now the largest and second-largest worldwide on these two continents, respectively.

Social media networks have been useful in developing nations because they can be an equalizer; can help save lives; and are instrumental for economic empowerment, public mobilization, and protest organizing; as well as for documenting

human rights violations, voting rights violations, and corruption. People in developing nations prefer communication through social networks both because of interactivity and flexibility and because social media content is more often displayed in other languages than English and is often more culturally relevant than other Internet content.

Facebook

Facebook's stated mission is to make the world more open and connected, and the Facebook corporation has been looking outside of the developed world to market its products. This seems to make sense, since beyond Facebook's largest market, the United States with 160 million users, its next three largest markets are all in the developing world, respectively Brazil with 58 million users, India with 56 million, Indonesia with 43 million, and Mexico with 38 million. Additionally, over 4 billion people have yet to get access to the Internet, and many subsequently to social media, and a majority of these live in developing countries.

In a report for the *MIT Technology Review*, David Talbot states that Facebook already has a well-established strategy of offering a Facebook-centric Internet to those in the developing world. This began in 2010 with Facebook Zero, which allows Internet carriers to offer a stripped-down text version of the social network as a free or low-cost service. About 50 carriers in 45 countries participate, and they get revenue when users click out of the text-centric Facebook Zero to see photos or other links displayed in the feed.

Facebook is augmenting its strategy of providing a Facebook-centric Internet to those in the developing world through its new Facebook Home, a collection of apps that lets Facebook lock the screens of smartphones and create a cover feed that fills those screens with status updates from Facebook friends. Facebook Home might have limited appeal to users in developed countries who might already be besieged with a variety of smartphone options, but it has a large market of users in developing nations in which smartphone adoption is at an earlier stage of growth.

Twitter

Facebook is not the only social media provider expanding quickly into the developing world.

Twitter, YouTube, Flickr, Google+, Google Chrome, and Instagram are also being promoted and gaining reputations in various parts of Latin America, Asia, the Middle East, and Africa. Twitter, which now has over 500 million users and over 200 million active users, has a growing presence in the developing world. Among the top 10 countries with the highest proportion of population with Twitter accounts are, along with developed nations (including the United Kingdom in first place, the United States in second place, and the Netherlands in third place), several developing nations (Chile in fourth place, Venezuela in fifth place, and Brazil in eighth place).

For countries whose media is strictly controlled by the government, such as Venezuela, Twitter has become the main source of freedom of speech. In Venezuela, there is only one television channel that is openly in opposition to the government, and even this television channel is often self-regulated due to constant threats of annulling its operating license. Consequently, over 30 percent of Venezuelans use Twitter, and many of them engage on this social media platform to voice their concerns and to let others know what is happening in the country. Additionally, Venezuelans in the capital of Caracas often post on Twitter or learn from Twitter about important community information that is not otherwise available regarding safe commutes to work, streets to take and streets to avoid, accidents that require help, and various types of hazards. As such, police and hospital representatives have consequently become accustomed to checking Twitter regularly.

Internet Access

According to a 2012 Pew Research Center Report, fewer people in developing countries have access to the Internet than in developed countries, but when getting access to the World Wide Web more people in developing countries are likely to join social networking sites than in developed countries. The report, which examined the state of social media internationally based on a survey of 20 nations worldwide, found that the vast majority of Internet users in developing nations such as Mexico, Brazil, Tunisia, Egypt, Jordan, Turkey, India, and Russia are using social networking sites. The report also found that, conversely, less than half of the Internet users in developed

nations such as Japan and Germany are interacting with others on social media platforms. While music, movies, and sports are popular topics across social media users in developed as well as developing nations, politics, community issues, and religion are more often approached by those in developing nations.

In Tunisia and Egypt, two nations at the heart of the Arab Spring, more than six in 10 social networkers share their views about politics online, whereas across the 20 nations surveyed a median of only 34 percent post their political opinions. Similarly, in Tunisia, Egypt, Lebanon, and Jordan more than seven in 10 social networkers discuss community issues online, compared with a cross-national median of just 46 percent. In Tunisia, Egypt, and Jordan more than six in 10 social networkers include religion in their online

A wheat farmer accessing information directly from the fields using a cell phone in India, a country where half the population owns cell phones. In 2013, almost a third of those with a cell phone worldwide connected to the Internet through it.

comments, while cross-nationally only approximately 30 percent post anything about religion.

The Pew report and other reports by the United Nations (UN) Foundations and by technology expert groups show how the adoption of cell phones has led the way for this growth in social media usage in developing countries. In 2013, the number of cell phone subscriptions was roughly equal to 90 percent of the world's total population, while global mobile/cellular penetration was estimated at 96 percent, and almost a third of those with a cell phone got on the Internet through it. Asia has the largest and Africa has the second-largest Internet usage through mobile phones, enabling those without the financial or infrastructure means for fixed-line Internet to get online. A relatively cheap mobile phone is a more realistic option in Asia and Africa than a fixed-line connection, and it still provides a quite stable way to reach the Internet. Over 60 percent of the people in Mexico, over 75 percent of the people in Egypt, over 85 of the people in Turkey, and over 50 percent of the people in India own cell phones, and many of them employ these for not only Internet access but also social media presence.

In both developing and developed countries people use cell phones for sending texts, pictures, and videos, but in developing countries people are more likely to share such items with larger groups through social media, whereas in developed countries people tend more to share such items with small groups of family and friends through texting and conferencing. Additionally, when using cell phones, those in developing countries are more likely to engage in conversations online, whereas those in developed countries tend more to check the news, consumer information, and job-related information.

The rising ownership of cell phones in developing countries, followed by the access to the Internet and use of social media in such countries, has been attributed primarily to the emergence of a middle class across the developing world. People in developing nations are entering the global market for the first time and are just beginning to garner the attention of major global brands. They are earning enough disposable income to start buying mobile phones and other products such as household appliances or means of transportation. They constitute an attractive consumer

market all the more as the annual growth rates of developing nations are much higher than those of developed ones. As developing nations become established as consumer markets, the costs of phones and of data plans continue to decline, and phone coverage and telecommunications infrastructures continue to improve, thus making phones and Internet connections through them increasingly affordable.

Use and Effects

Regarding reasons for the widespread use of social media in developing nations, two of those outlined by expert Mike Shoag are that social media can be an equalizer and can help save lives. Those with little economic power and without access to services can now tap into information and resources pertaining to education, health, safety, or financial opportunities in ways that were impossible before mobile phone technology and social media. In countries in Latin America, Asia, and Africa, people have started to share on and get from social media networks information regarding survival and life skills and personal and community protection. As a World Health Organization report recently stated, one emergency message can be spread through Facebook or Twitter faster than any influenza virus. Additionally, social media provides real-time insight into the lives of people, and as such thorough monitoring of social media can help predict disease outbreaks and enable remedial interventions more accurately than traditional methods of prediction and intervention. As a *Chronicle of Higher Education* article recently affirmed, social media tracks cholera better than any health authority.

Another reason mentioned by Shoag for the success of social media in the developing world is that social media can be instrumental for economic empowerment. Many individuals, groups, and communities in developing countries can gain access to microlending programs with help from social networks. Additionally, social media is increasingly useful to farmers in various parts of the world, who were often tricked because they did not know the value of the crops they grew before they gained access to social media networks, and who today are savvier traders because they can find out the correct prices of their products through social media. For example, the

World Bank's International Finance Corporation has funded a project that helps farmers with information about prices via a short messaging service (SMS) message platform.

Social media is also useful, for example, to cattle owners in Kenya, who were not able to track a cow before the existence of social media, but who can now find out where a cow is through social media. Kenyan authorities use a SMS platform to find stolen cows, which are expensive in the country and very important for the livelihoods of people in rural areas. A local Kenyan, for example, knew nothing about this platform until one evening when her cow disappeared; she was advised to post on the network and her cow as well as the thief were identified within 30 minutes.

Mobilization and Protest Organizing

Social media have also become so popular in the developing world because they can be instrumental for public mobilization and protest organizing. Social media networks have often been employed in actions striving for fairness in recent years. For example, the social media campaign of the Invisible Children organization to prevent Joseph Kony and his militia group, Lord's Resistance Army, from forced recruitment of child soldiers in northern Uganda, the Democratic Republic of Congo, and southern Sudan, while so far not having led to the capture of the rebel leader, has helped bring international awareness to the horrific cases of kidnapping, abuse, and killing of children in the area. Numerous politicians, activists, and celebrities from various parts of the world have become involved in promoting the cause, and the African Union, backed by the UN and the United States, has established a brigade to put an end to the atrocities in the region. In addition to helping raise awareness about various causes, social media can help organize protests related to such causes. It has already been extensively documented that social media such as Facebook and Twitter functioned as a catalyst in the Arab Spring, enabling protesters to meet, put their forces together, and resist government actions. Social media are arguably becoming part of an emerging system of political communication in which discontent can be expressed even when formally forbidden by an autocratic government and a movement can be organized by announcing to people where they should gather.

Several recent studies have examined the role of social media in public mobilization and protest organizing in a developing nation through cases from the Middle East. Social networking sites including Facebook, FriendFeed, Flickr, and Twitter were central to organizing and publicizing the postelection protests in Iran in 2009, facilitating solidarity inside the country and in the diaspora, although these conjugated efforts were ultimately unsuccessful in overthrowing the regime.

Social networking sites were also at the core of the uprising in Egypt in 2011. Various groups including the April 6 Youth Movement, We Are All Khaled Said, National Association for Change, and Kefaya used social media platforms to coordinate the spread of a revolutionary message. These groups called for gatherings in Cairo's Tahrir Square as well as in Alexandria, Mansoura, and Suez to express outrage over the economic oppression of the population and the administrative malfunctioning of the state. Their demand was for Egypt's President Hosni Mubarak to leave the country. About 85,000 people pledged on social media to attend the gatherings, and over a short period of time the revolutionary groups gained tens of thousands of Facebook friends and Twitter followers.

On January 28, 2011, Mubarak shut off the Internet for five days across the entire nation to halt the communication flow and coordinated assembly taking place over social media platforms. This outraged the international community and made the protesters even more determined. Following the blackout, over 1 million Egyptians joined demonstrations across the country, a tenfold increase in the number of participants. The day the Internet was restored, social media experienced its highest number of active users from Egypt ever.

As the demonstrations continued, some of the nation's most prominent public figures came out in support, and they too posted online comments. After 18 days of relentless protest, the unthinkable happened: putting an end to 30 years of authoritarian rule, President Mubarak heeded the demand of the Egyptian people and resigned from office. Since the Egyptian uprising, people in the developing world have increasingly used social media for political activist purposes.

Citizen Journalism and Human Rights

People in developing nations have also come to rely on social media for sharing as well as for learning about human rights violations in various settings, voting rights violations during elections, and corruption at various societal levels. Prior to smartphones, special gear was needed to capture instances from everyday life in pictures and videos, and media professionals were the only ones with capabilities not only to capture such instances but also to make them broadly known. Many situations of social injustice, political abuse, or administrative dishonesty used to remain unreported either because there were insufficient media professionals to cover all such cases or even because professional journalists agreed to hide, partake in, or benefit from such actions.

Today, almost anyone with a cell phone can take a picture or make a film, and many can share such materials with the world in nearly real time. This has had a dramatic impact on many realms, not least of which is the ability of people in developing nations to provide eyewitness accounts of oppression, violence, and abuse. The images of a young man who set himself on fire to bring attention to the corruption of local officials in Tunisia, or the video of a female protester who was sprayed with tear gas by police in Turkey, captured by locals, spread fast through social media, and showed the world what was happening in these countries. Moreover, iReport-style mobile apps have allowed regular citizens to show what occurs during social unrest and to report such situations as police brutality, and iVote-style mobile apps have allowed regular citizens to monitor elections and report such situations as vote rigging.

Corruption

A study by Catie Snow Bailard, published in *Political Communication* in 2009, outlined the use of social media through mobile phones in Africa to combat corruption. Bailard writes that common forms of corruption in countries such as Cameroon or Namibia include misappropriation of aid from international donors and non-governmental organizations; misappropriation of government resources; bribes for basic services, administrative assistance, special policies, and licenses; clientelist politics; and favors to ethnic compatriots. Bailard asserts that such practices,

which are arguably catastrophic in many African nations, often flourish due to lack of transparency and low likelihood of detection. This researcher states that elite monopoly over telephonic communication increases the opportunities available to commit corrupt acts and decreases the likelihood of detection and/or punishment. Conversely, the use of mobile phones and access to social media through mobile phones helps uncover acts of corruption, increases transparency, provides means of detection, and can lead to imparting the appropriate punishments. For example, social media users can signal to one another, to justice-oriented organizations, and to the international community instances in which international aid and government resources are appropriated by those in power rather than given to those in need. Social media users can also document with pictures and film abuses and bribery in administration, elections, and the treatment of various ethnic groups. Bailard also affirms that in order for mobile phone communication to effectively serve in combating corruption there is a need for public awareness campaigns as well as for coordinated efforts, including through traditional media and social media, of activists inside those countries and in the international arena.

A powerful example of social media activism utilized for combating corruption comes from India, where social media outcry helped stop President Pratibha Patil's plan to build herself a postretirement residence on land meant for military veterans. On April 11, 2011, moneyslife.in carried a lead story uncovering that President Patil had grabbed 261,000 square feet of land that was intended for facilities for former soldiers. While former-presidents are entitled to secure accommodation paid from the national budget, Patil's project was criticized because she was trying to do that while she was still in office and at the expense of the military, and also because of the huge size of the piece of land and the luxury of the projected home.

After the story broke in moneyslife.in, activists used social media platforms including Facebook and Twitter to provide daily updates (including tree cutting on the property, explanations by the president and her advisers, and reactions of military personnel and of opposition forces) and to mobilize for action (starting online petitions and asking for street protests). While initially Patil,

who herself had used a combination of traditional media and social media strategies to win the elections in 2007, refused to give in to the social media dissent, finally she announced on April 27, 2011, that she would stop the construction of her residence and return the land to the possession of the state. Following this scandal, propagated through social media, Patil decided to not seek re-election as president of India in 2012.

Culture

In addition to serving health, economic, political, and social purposes, social media networks also have a cultural role in the developing world. A study by Amir Hatem Ali, published in the *Harvard Human Rights Journal* in 2011, details this role. According to Ali, there is language disparity on the Internet, with English being its unofficial language and over three-quarters of all Web sites being in English, and consequently the Internet has been more accessible to English-speaking people. Before the emergence of social media, the lack of online content in languages other than English limited Internet development in nations where English is not the primary language. With the growth of social media, other languages than English are more frequently utilized in the online environment, and this is appealing to people from developing nations and also offers an opportunity to bridge the digital divide.

Additionally, there is cultural disparity on the Internet, with Western ideas, products, and practices being the main focus and an overwhelming majority of Web sites coming from developed nations, and consequently the Internet has been viewed with reluctance in developing nations around the world. Again, social media allowed people from such nations to contribute and seek culturally relevant and culturally sensitive content and has also made people less inclined to see the Internet as a Western technology that might be a threat to their local cultures. Growth of Internet use in developing countries, after a period of stagnation, might be related to such aspects.

Ali provides several examples of instances in which the collaboration between the international community and local agents has resulted in increased abilities of people in developing nations to partake in the creation, management, and sharing of local content for local use through

social networking platforms. Such a program is e-Sri Lanka, partially funded by the World Bank and supported by the government of Sri Lanka, through which people in this country were encouraged to build “knowledge centers” through social media capabilities.

Conclusion

Social media are more affordable for those in developing nations because posting or searching on social media networks is free beyond paying the already decreasing cost of Internet connectivity, and requires little knowledge of technological underpinnings beyond familiarity with getting online. Additionally, social media empower individuals to create their own content (for example, posting on someone’s Facebook wall, posting a video to YouTube, or tweeting), and as such it is more convenient for people in the developing world than more centralized approaches to generating content. Social media substantially reduce barriers regarding publishing content to the World Wide Web by simplifying the process of publishing, allowing self-expression as well as collective action, and encouraging users to become active participants rather than being passive readers, listeners, or viewers. Thanks to these features of social media, the next billion people will be easier to engage.

Diaspora/Migration

Social media provide a particularly fascinating entry point to explore diasporas, because diaspora and digital communication platforms are both characterized by paradoxical processes of space and time compression. The links between the two processes have only received increased attention during the last few years, although the current total number of transnational migrants would amount to a country that would rank among the first 10 in size globally.

Diasporas online raise questions about the core dynamics of cultural globalization spurred by the developing World Wide Web and transnational migration flows: Do they ultimately, globally connect or divide humans; enable opinion formation, voice, mobilization, and protest, or new forms of surveillance and censorship; homogenize and balkanize the Internet or promote diversity; promote democratization or reinstall hierarchies? Evidence for all these processes is emerging and movements in both directions have been observed.

Etymologically, the term *diaspora* derives from Greek words for scattering, sowing, and movement, while historically the notion was used mostly to describe Jews living outside Palestine or modern Israel. Currently, the term *diasporas* captures the dynamics of people migrating away from their homelands, to describe people living outside of their homelands and to indicate the geographical locations where these people live.

Media and Technology

Previously, migrants became largely uprooted from their origins when having to make do with letters that took a long time to arrive or costly phone calls to stay in touch with family and friends in their homelands. Recent developments of low-cost airlines, social media, and affordable long-distance telephone services allow migrants to maintain transnational ties with contacts living in the diaspora and their home countries. Indeed, although technology developers did not project them as target groups, migrants have been early adopters of technologies motivated by their desire to keep in touch with family members and friends and remain engaged with developments in their homelands.

Digital technologies are often celebrated with freedoms gained through increasing speed,

mobility, unboundedness and deterritorialization, while migrants are often found to negatively experience deterritorialization as displacement and dislocation instead of freedom. With the widespread adoption of digital technologies, those living in the diaspora may however digitally reterritorialize themselves. Being inexpensive, decentralized, international, low-threshold, easy-to-operate, and fairly deregulated, social media enable migrants to remain connected beyond their physical environments. Examples include audio- and video-chat including Skype and Viber; social networking sites such as Facebook and QQ; microblogs such as Twitter and Weibo; video sharing sites like YouTube and DailyMotion; and mobile messenger applications such as What's App, Nimbuzz, and iChat. Social media and digital technologies such as the mobile phone have thus altered processes of migration and diaspora formation, as migrants in the diaspora may experience living in a third space—a space not here or there, beyond their homeland and country of arrival. The third space sustained through social media might be of assistance in coping with feelings of dislocation and homesickness. Furthermore, it may provide an outlet for the circulation of news, identity and belonging, arranging for remittances, mobilization, protest, and activism.

Several recent large-scale research projects have explored the intricate relationships between diaspora groups and social media use. Under the heading of Mig@Net a consortium of European researchers studied how migration and gender intersect in transnational digital networks. They focused in particular on border crossings, communication flows, religious practices, education, sexualities, social movements, and conflict/dialogue (MigNetProject.eu). The e-Diasporas Atlas brought 80 researchers using digital methods together to map various processes of migrant connectivity. In particular, they traced the online presence of various groups, including “Moroccans on Facebook,” “French Expatriates,” and also Chinese, Tamil, Tunisian, Palestinian, Russian, Hmong, and Lebanese diasporas, among others (E-Diasporas.fr).

Political Implications

Several separatist movements use social media to garner public support for greater autonomy over

geographic regions. As such, global and deterritorialized social media are used by landless population subsets to manifest territorial claims. These include Tamil Eelam, Kurdish people, the Free Tibet Movement, and Uyghurs. The Sri Lankan Tamil diaspora is estimated at 877,000 people. On the Tamil Nation Facebook group and other Web sites, blogs, and forum discussion pages such as eelamweb.com (“aimed at rebuilding Tamil Eelam”) and eelam.com (“advancing the independence of Tamil Eelam”), Tamils living in the diaspora make claims for the nation of Tamil Eelam, expressing desire for political autonomy in Sinhalese-ruled northern parts of Sri Lanka.

The “Kurdish question,” which pertains to autonomy of the region of Kurdistan in southwest Asia, is increasingly debated online by cyber-Kurds. Portions of the estimated 850,000 Kurds living in the diaspora use blogs such as kurdistanblogcount.wordpress.com (“a blog counting the blogs of Kurdistan”), Facebook groups such as the “Support an Independent Kurdish State” page, and Twitter hashtags such as #Kurdish to identify messages pertaining to Kurdish people, culture, and politics.

Young Tibetan activists in the diaspora advocate for Rangzen, an independent state of Tibet, on social media. They attract users to their cause on Twitter using, for example, the hashtag #FreeTibet. Dharamsala, the capital of the exiled Tibetan community in the Indian Himalayas, is home to an estimated 150,000 Tibetans. Social media use increased during the 2008 Summer Olympics in China and the 2011 community elections in exile. Illustratively, Tsering Choedup, an International Tibet Network Asia Coordinator, noted,

I see social media such as not just as an intermediary to relay news stories but also as an important and effective tool to directly connect individuals together and mobilize the overseas Tibetan diaspora community, and to awaken global awareness on the Tibet issue. Social media also give an opportunity for exiled Tibetans to build a link with Tibetans inside Tibet despite China's Great Firewall.

Proxy servers allow users to bypass Chinese Internet protocol-address-based geo-located filters and censorship.

Uyghur people are a Turkic-Muslim minority group living in the northwestern Chinese Xinjiang Uyghur Autonomous Region. An estimated 600,000 Uyghur are living in the diaspora. Uyghur language Web sites Diyarim.com, Salkin.com, and Shebnem.com were tightly monitored after July 2009 mass mobilizations by Uyghur protesters in Urumqi, the capital of Xinjiang. In September 2009, Xinjiang authorities approved Internet monitoring legislation, blocking Internet access for 20 million inhabitants in the region. In addition, the surveillance of these sites eventually led to the arrest of hundreds of moderators and contributors living in China.

Sites maintained by Uyghur people living in the diaspora have also been blocked by the Great Firewall of China: Reporters Without Borders found in October 2009 that 85 percent of Web sites dedicated to the Uyghur community were blocked. Nonetheless, a transnational Uyghur political/cultural space is maintained on platforms like Facebook (the “Uyghur Community” page), Weibo, and YouTube as emotional responses and calls for mobilization circulate alongside Uyghur language folk songs and Islamic-themed videos.

Social media are also used to mourn dissolved geographical entities. For example, former Yugoslav countries are digitally reunified on Titoville.com and other sites that disseminate Yugo-nostalgic and retro-socialist discourses. Discourses published on such sites may downplay the atrocities and traumas of war and conflict.

Furthermore, diasporic media, increasingly visible on Twitter, Facebook, and YouTube, not only connect diaspora audiences with their homelands, they may also provide bottom-up interventions in Western-dominated international news media flows. During protests in Tunisia, Egypt, Libya, and Syria, postings on Facebook played a chief role in circulating news about political discontent from homelands and the diaspora to mainstream media such as CNN and Al Jazeera. The Jasmine Revolution of 2011 in Tunisia was fuelled by digital alignments between the homeland and the Tunisian diaspora sustained through Twitter, YouTube, and DailyMotion and blogs such as Nawaat.org. In addition, ElectronicIntifada.net, set up by U.S. citizens of Palestinian origins, has become an important global English-language news outlet providing alternative coverage on Palestine issues.

Members of the Tibetan diaspora in the United States march past New York's Grand Central Station on October 10, 2009, on their way from the United Nations to Times Square. The cultural parade marked the 50th anniversary of exile from Tibet.

Beyond rallying for support and providing news, digital technologies are also used for activism and even sabotage. Tamil cyberactivism, for instance, included electronic disruption of Sri Lankan embassy Web sites that Tamil activists felt disseminated propaganda. In a similar vein in early 2013, Twitter user “@ThisIsGameOver” defaced the official Web site of Sri Lanka's Media Center for National Security. Palestinians living in the diaspora have aligned themselves digitally with the “Boycott, Divestment and Sanctions” movement by campaigning against Israel on the popular Facebook group page “BDS movement.” The international Anonymous hacker collective has assisted activist diasporic groups during the Arab Spring by hacking into government Web sites in 2012.

Other Uses and Concerns

In addition, everyday use of social media among people living in the diaspora provides migrants—who are often marginalized in their country of arrival—opportunities to assert their voices, provide alternative depictions of minorities, identify themselves with fellow diasporic subjects as well as their homelands, express belonging, and show solidarity. Living in the diaspora, Indian migrants (nonresident Indians or NRIs) may, for instance, turn to the three-dimensional virtual game environment of *Second Life* to articulate a Desi identity (diasporic south-Asianness), interacting with avatars (game characters) that, for example, combine Indianness and American popular culture. As the popularity of dedicated discussion forums such as AsianAvenue.com, BlackPlanet.com, and MiGente.com, frequented by Asian Americans, African Americans, and Latino Americans, respectively, showcase, social media may be perceived as safe space to gather, articulate hybrid identities, and circulate alternative community knowledge.

What remains unclear in the emerging literature on digital media use among migrants are (1) the disparities in technology ownership and Internet access between diaspora communities living in first world countries and those remaining in developing countries; (2) the role of social media in financial transactions and remittances; (3) differences and similarities between economic migrants and refugees; (4) the implications of tracking and data-mining migrant activity by government and state regimes; and (5) the role of social media in human trafficking, circumventing border patrol, and policing.

Considering the role of digital technologies in diaspora and migration underlines the urgency of contextualizing social media use. Social media do not exist in isolation and use in the diaspora is shaped by the sociopolitical history of the different homelands, the variety of motivations for displacement or migration (which may be political, economic, social, or religious), and the present living conditions and social, political, and economic status of diasporic people in their country of arrival.

Digerati

The term *digerati* is a label used to refer to the technological elite. Digerati are distinguished innovators and opinion leaders of information technology, cyberspace, social media, and the technological hardware industries. The digirati have come to fruition in an environment in which the intersection between information and networked technology continues to grow. People considered members of the digirati are technological elites who are professionals at the forefront of the Information Age. The digirati both understand and advance the economic focus on technology and, as such, have immense control over the flow of digital information. Control over the means of communicating digital information is a decisive responsibility that could plausibly influence the way people understand and interpret politics throughout the world. In essence, digirati is a class of people both economically and ideologically.

Economically, the digirati develop, finance, and generate the innovations and products characteristic of the Information Age. The economic underpinnings of the digirati class are distinguished from more traditional business elites first and foremost by their business philosophy focusing on information as a valuable resource rather than any material product. In addition,

the digerati are rarely seen as in competition with one another. Instead, the digerati often talk to one another about ideas. They encourage innovative breakthroughs in one another. John Brockman notes that the cooperative competition characteristic of the digerati is a key to innovation born from within the digerati class.

The digerati also have a unique ideological view of the entrepreneur–worker relationship. Eran Fisher proposed that the digerati remove workplace hierarchy. The traditional workplace is rejected by the digerati, who favor an environment in which the workers are the entrepreneurs and the entrepreneurs are the workers. At one point in time, the color of a man's collar dictated his level of importance within the workforce. The digerati reject collars altogether in favor of denim jeans and cotton T-shirts. In turn, the digerati perceive themselves as equally invested in the success of their endeavors, regardless of traditional workplace labels.

The term *digerati* is a hybrid of *digital* and *literati*, a centuries-old Latin term describing the intellectual community who read and critique literature. Hence, the digerati are those who are society's premier digital intellectuals. The term joins other labels proposed to describe this class of people, such as the virtual intelligentsia or the creative class. The origin of the term *digerati* as a descriptor of the technological and cyberelite is debatable; however, popular press articles in *The Guardian*, *San Francisco Chronicle*, and *The New York Times* have all used digerati to refer to a range of people within the technological elite. Most would consider the premier bloggers, hardware developers, software developers, Web developers, and social media innovators as members of the digerati. However, the digerati label is appropriate for individuals in publishing, business, and academia who influence the economy of the Information Age as well. The social media landscape is malleable, with an influx of new, formidable players who are continually altering the face of the digerati.

When one considers the responsibility of the digerati to transform communication technologies and assign functions for the use of technological innovations, the influence of the digerati on the diffusion of information to the public becomes clear. In turn, the capacity of the digerati to alter political information also becomes evident. Consider the Google problem of Rick Santorum as a case study in the

relationship between the digerati and politics. Santorum was a candidate for the Republican nomination for president in 2012. Years prior, columnist Dan Savage started a campaign to redefine a lewd sexual act as a “santorum” in an effort to defame Rick Santorum. In turn, when searching “santorum” on Google, the first entries that appeared were the Web sites constructed by Savage related to a sexual act. The Santorum presidential campaign requested the sites be removed from Google searches, but Google refused. One can see how the digerati at Google made decisions that were based on their philosophies about the diffusion of information and, subsequently, how said decisions could be interpreted as politically charged.

The digerati are a new class of individuals considered the cyber- and technological elite. Digerati often have the means to reinforce or alter the exchange of information, including political information; as such, digerati have power to influence the flow of political information.

Digg

Digg, begun in 2004, was a social news site and one of the best-known examples of Web sites relying on user-generated content, a phenomenon commonly referred to as Web 2.0. Essentially, Digg was

a Web platform where users were able to submit stories and have other users upvote or digg them. Celebrated as a turning point in the way that news stories were aggregated and disseminated across the Web, one of Digg's strengths was the ability for stories that didn't make the mainstream news to reach a wider audience if there was enough interest in digging it. While Digg was initially focused on technology stories, the site soon became a key way for political news stories to spread.

Digg was launched in 2004 by TechTV star Kevin Rose. The site grew in popularity over the next few years and became one of the most heavily trafficked sites on the Web. In 2012, the site was sold off to a number of companies (including LinkedIn, BetaWorks, and the *Wall Street Journal*) and went under a complete redesign. With the 2012 redesign, the focus has shifted to bigger stories dominating the site with more editorial oversight. With this major change, it remains to be seen how this will affect the overall distribution of mainstream versus alternative news stories.

Like earlier social news and bookmarking sites, such as Slashdot and Del.icio.us, Digg has long been used as an example of how the Web democratizes media coverage of politics and world events. Rather than have news stories chosen by a group of newspaper editors or television producers, Digg's structure (particularly in the older version) allows that process to happen via crowdsourcing. Rather than a small group of people choosing what content makes the front page, that decision is made by each individual person who diggs (votes up) or buries (votes down) a particular story. This process lends itself to alternative views having a chance at the spotlight, but it can also simply mean that predictably popular stories reach the front page.

While its beginnings were largely devoted to technology stories in 2004, by the 2008 presidential elections political stories soon began to dominate both the main page on Digg and media coverage about Digg. The site arguably reached its peak of popularity during this time, and beginning in August 2008, Digg began its Digg Dialogg series, which was a collection of video interviews with prominent politicians and celebrities in which the questions asked were generated and voted upon by the Digg user community. These Digg Dialoggs began with House Speaker Nancy Pelosi during

the 2008 Democratic National Convention and, over the next two years, included interviews with notable political figures such as Bill Clinton, Al Gore, John Boehner, Treasury Secretary Timothy Geithner, and Federal Communications Commission (FCC) Chair Julius Genachowski. In late 2008, Digg also came under criticism for what was perceived as a liberal bias as most of the top stories on the front page came from left-leaning Web sites such as *Huffington Post* and right-leaning stories were often buried.

While the 2012 sale and redesign of Digg has dramatically changed Digg's form and function, the concept of socially curating the news that Digg helped to popularize has had ripple effects throughout the Web as mainstream media sites included ways to share their content on sites like Digg, Reddit, and StumbleUpon as well as social networking sites like Facebook, Twitter, and Tumblr. By 2011, even CNN occasionally let viewers choose which story would air in the next hour of television by voting via text message, demonstrating that the idea of crowdsourcing the news had become a fixture for the public. Regardless of Digg's future after its sale and redesign, the Web and social media continue to redefine the limits and possibilities of user engagement with journalism and politics, and the impact of Digg is an important part of that change.

Digital Citizen

In 1997, *Wired* contributor Jon Katz introduced the concept of the digital citizen. In his original article, Katz posited that a postpolitical community was developing and brought with it a blend of liberalism (focusing on humanity) and conservatism (highlighting economic positions). In this way, the new community would directly refute the interventionist attitudes of the left and the base intolerance of the right. This new community—which Katz referred to as digital citizens—embraces rationalism, believes in civil liberties and free-market economics, and overall leans toward moderated libertarianism. Most important, it believes all of this while actively utilizing available technologies. Since his initial claims, there have been numerous studies of digital citizen, including another by Katz, and the eventual development of a Bloom's taxonomy for this American.

The cornerstone of the digital nation—as perceived by Katz—is individuals who actively participate on the Internet. Their professional and social lives revolve around their ability to function on the Internet. While today this may seem like commonplace, in 1997—when Katz was writing—the number of Americans in this category was rather limited.

In 1997, these individuals seemingly formed a new social class. Digital citizens then did not consist of a representative sample of the American public. Members were young, educated (or at least in the process of gaining an education), and typically affluent. They had disposable income and more free time than the average American. Most worked in a small number of industries—higher education, computers, telecommunications, financial, and media. At the time, they were geographically clustered in many of the same areas where today's leading tech firms are. Digital citizens were found in New York, the San Francisco Bay Area, Seattle, Boston, Austin, and the Research Triangle of Raleigh–Durham–Chapel Hill in North Carolina. Originally, most were male; and a vast majority was white.

With their reliance on the Internet, they also had access to far more information than the average citizen. Given their continuous education, they actively sought out opportunities to gain knowledge, making their political beliefs more

fluid than the traditional party structure typically allowed for.

Despite the fluidity of their understanding, Katz did believe many of their common values were fairly obvious. Digital citizens are libertarian, tolerant, technologically adept, disconnected from traditional politics, rational, materialistic, and eager to learn. Most important, they enjoy discourse and discussion. Instead of accepting decisions as fact, they choose to ask why and how. In this sense, they will challenge authority when necessary and are apt to do so publicly via the Internet. Passivity is simply not common. Likewise, they share a love for popular culture. While they are attuned to politics, they are far more likely to talk about movies and television. These things are not simply entertainment; they are their identity. As would be expected, the digital citizen tends to view the population of the world in two categories: those who understand and those who do not. When it comes to government, the digital citizen has a negative view. Government is wasteful and clueless—unable or unwilling to be efficient and effective with the resources provided to it. They view politicians as uninformed and unwilling to work for solutions. The digital citizen simply does not believe in the conventional political process.

Categories and Characteristics

After Katz's initial predictive article, *Wired* worked with the Merrill Lynch Forum to conduct a survey assessing Katz's claims. In an effort to create a clear profile of the digital citizen, the survey involved just fewer than 1,500 Americans who were divided into four categories based on their usage of e-mail, laptops, cell phones, beepers (revealing the age of the study), and home computers. The *Wired* categories were superconnected (e-mail three days a week and all four of the pieces of equipment), connected (e-mail three days a week and three of the pieces of equipment), semiconnected (at least one piece of technology), and unconnected (none of the pieces of technology). Digital citizens were deemed to be those in the superconnected and connected categories. In total, based on the survey they represented 8.5 percent of the overall American population.

Connectivity was found to lead to more democratic values, more political participation, more political knowledge, and better trust of said

institutions. Connected Americans are shown to have more political knowledge (as Katz notes, more connected individuals were able to identify Newt Gingrich as speaker of the House than knew Seinfeld's first name is Jerry).

Connected Americans are considerably more likely to read books, which contradicts the anti-literacy claims made by those who are opposed to technology. Further, digital citizens are more likely to be informed and outspoken and have prodemocratic ideals. They are more likely to have confidence in democracy and take action by voting. In short, the less connected people are, the more ignorant they appear to be. These findings run against some of Katz's original hypotheses, which claimed that digital citizens were not likely to be involved in mainstream politics. Additionally, critics of the study have pointed out that it is almost impossible to distinguish which is the cause and which is the effect within these variable relationships, wondering, for instance, if digital citizens are more politically engaged because they are more technologically sophisticated or if being more technologically sophisticated is somehow a cognate characteristic of political engagement.

Likewise, some of Katz's demographic beliefs were proven to be untrue with the survey results. First, digital citizens are found to be young but not necessarily youths. Connected Americans are more likely to be in their 40s than their 20s. Just over half of the digital citizens were male. As expected, almost nine out of 10 were white and over half lived in suburban areas surrounding large metro areas. When it comes to education, the results are both confirmatory and perplexing. Connected Americans are far more likely to have graduated from college, but fewer than half are in the category. The connected are economically well-off, with most in the middle class as compared to those not connected.

What the Katz article provided was a glimpse at the development of a subculture in America based on technological usage and skills. In the wake of Katz, there have been a rash of scholarly attempts to better understand what makes digital citizens unique and how their technological usage correlates to political attitudes and behaviors. In lieu of the development of digital citizens, there has even been a transformation of the classical Bloom's taxonomy (knowledge, comprehension,

application, analysis, synthesis, and evaluation) into a digital taxonomy (remembering, understanding, applying, analyzing, evaluating, and creating). The changes reflect the new nature of learning and gathering information in a digital world.

With the advent of social media, Katz's hypotheses become even clearer. Digital citizens use the Internet for both dissemination and deliberation. With the plethora of tools available today (even compared to 1997), digital citizens now access the Internet through computers, phones, and tablets. They blog, post on Facebook, upload to YouTube, and tweet on Twitter. And, there are clear differences still present between those who adopt and those who do not. If Katz felt there were differing levels of citizen usage in 1997, the myriad of options available today to individuals with an interest in following news or impacting change through the Internet has only made such divisions more clear.

Digital Cultures Research Center

The Digital Cultures Research Center (DCRC) is a network hub for researchers from across the

University of the West of England. Researchers from multiple disciplines, including art and design, computer science, cultural and media studies, and geography, collaboratively investigate contemporary technocultures, how people create culture via digital communications, and the applications, practices, and politics of emerging media technologies. Through a variety of publications, events, projects, and initiatives, the DCRC aims to support and promote research regarding the role and configurations of technology in contemporary cultures.

Research and Initiatives

The DCRC conducts research and promotes initiatives across five broad themes: pervasive media, play, participatory media, the attention economy, and connected communities. DCRC's pervasive media research focuses on how technology is being integrated into the fabric of urban space, how content creation provides individuals new ways of engaging with and in their environments, and how tagging digital content can impact advertising, education, and entertainment. DCRC's play research, investigating the cultural significance of play and games, has led to the development of core texts within the field of game studies. The center's participatory media research examines how new forms of social media production, such as Web 2.0, alter cultural production. This research, which could be especially relevant to politics and political communication, examines the influence of expanding user-generated content, such as blogs, citizen journalism, peer-to-peer media distribution, and video and photo sharing Web sites, and its impact on culture. The attention economy research looks at how social and technological environments, where many individuals in democratized societies spend their lives and time, alter the traditional values of the public sphere. This research positions human attention as a scarce commodity, with the attention of individuals being estimated, costed, marketed, bought, and sold via technology. Finally, connected communities focus the DCRC's broad areas of research into the context of social values by examining how individuals engage in civic engagement and participatory culture via creative citizenship, or the use of creative resources and talents to engage socially and civically.

The research conducted by the DCRC revolves around the concept of critical reflexivity, which combines criticality, creativity, and application. Critical reflexivity incorporates critical reflection on ethics, values, and aesthetics and combines creative arts, experimentation, and innovation with digital media in an effort to make the center's research more useful for its audiences. Much of the center's research is conducted in open-innovation studio space. This atmosphere provides a unique environment where ideas are shared through knowledge transfer projects, and designers, artists, and engineers can share expertise to produce more effective research results.

Projects and Partnerships

The DCRC also engages in projects with multiple worldwide partners. The center engages in a range of projects that aim at understanding the various applications of new media and how individuals interact daily with technology. These partnerships work to develop location-based applications along with new forms of performance and narrative and to inform new media development strategies.

Partnering with Knowle West Media Center, the DCRC's Keeping in Touch project looks at how communities may be strengthened through individuals' everyday uses of mobile media and communication technologies. The Measuring Value Networks project pairs the DCRC with the Watershed Media Center to produce a multicriteria method that organizations can use to measure the value of their digital networks and leverage them to develop and strengthen their networks' communities. The Creative Citizens: Creative Networks project examines online interaction between individuals participating in different types of networks, both formal and informal, to understand value-creation communication. The goals of this project are to understand the potentials that communication patterns, built around online platforms, may have in the practicalities of creative citizenship, community engagement, and community-led design and to recognize both the potentials and limitations of digital media. Finally, a project called Microethology investigates the habitual coming together of individuals and technology and considers how digital culture is experienced in everyday life. This project strives

to develop a method for analyzing the everyday interactions between people and digital media.

Conclusion

The DCRC produces research aimed at enhancing knowledge and understanding regarding how technologies are integrated into contemporary cultures. Through research, projects, and initiatives, the DCRC is able to provide valuable information and data regarding how individuals engage in digital communication environments.

Digital Diplomacy

Digital diplomacy refers to emerging multidimensional platforms that have the potential to enhance international relations and other political communication. The Internet and social media are already being used by national governments to disseminate messages to sway public opinion and influence other countries. At best, these efforts are part of an integrated structure that supports strategic goals and complements conventional diplomacy tools.

Diplomacy, as the art and practice of conducting negotiations between nations, is a complex form of communication that needs different media to reach its target. Through digital media, the actors of diplomacy can listen, publish, engage, and evaluate with innovative and new techniques that enrich the quality, reach, and impact of their work. Diplomacy via information communication technology (ICT) obviously has more power to reach and affect target audiences such as non-governmental organizations (NGOs), other governments, citizens, and others. This approach has been called digital inclusion in diplomacy or digital civil engagement.

Public Diplomacy

Conventional diplomacy might be described as the ways in which government leaders communicate with each other at the highest level—the familiar form of elite diplomacy. However, public diplomacy, on the contrary, focuses on the ways in which a country (or multilateral organization such as the United Nations) communicates with citizens in other societies. The term *public diplomacy*, which is associated with the U.S. Information Agency, was coined in the mid-1960s to describe the conduct of foreign policy by engagement with foreign publics. Much digital diplomacy is based on the principles of public diplomacy.

Technology continues to present new challenges to the way that diplomacy is conducted. For example, computer databases enable the collecting and sharing of vast quantities of information, while upgraded networks facilitate instantaneous communication. Information has always been the raw material of two of diplomacy's basic tasks—reporting and negotiating. In both cases, the advantage lies with the side that is better at using advanced technologies to collect and process the data needed for decision making.

When the structure of contemporary digital diplomacy is analyzed, the four steps observed in any digital diplomacy activity include listening, publishing, engaging, and evaluating. By listening, one can find out which blogs, groups, and forums are already discussing the issue; gauge their attitudes; and figure out the angles and tones. By publishing messages in news, blogs, videos, and pictures across the global Web, a presence can be pushed out creatively. In the engagement step,

people can encourage questions, take part where the debate is happening, and form partnerships with relevant organizations and online groups. Finally, in the evaluating process, one can explore whether goals have been achieved.

Examples

One example that supports the idea of the potential of digital diplomacy was the virtual news conference held by Undersecretary of State for Public Diplomacy and Public Affairs James K. Glassman in 2008. On the virtual platform of Second Life, Glassman had a conversation with eight Egyptian political bloggers who had covered the latest presidential election in the United States. It was an international event that a global Internet audience had the chance to follow via live Webcast.

The Public Diplomacy 2.0 Program, established by Glassman, was also a turning point in the

comprehension of contemporary diplomacy. The program focused on using new social networking sites, including the creation of a Facebook page for the State Department's Educational and Cultural Affairs Bureau. The Digital Outreach Team (DOT) program also established blogs in many languages including Arabic, Urdu, and Farsi.

Conclusion

At its most basic, digital diplomacy offers a new way to solve foreign policy problems using various Internet platforms; digital diplomacy is conventional diplomacy through a different medium. It can be said that this new form of diplomacy is a consequence of the emergence of Web 2.0, because it makes use of social media's interactive features. Web sites, Facebook, Twitter, blogs, and vlogs may now be seen as methods of soft power and as effective management tools.

Digital Due Process Coalition

The Digital Due Process Coalition (DDPC) is an alliance of bipartisan political, commercial,

and legal interests seeking to reform U.S. laws on access to electronic communications/data. Launched in 2010, the DDPC has sought to reform key aspects of the 1986 Electronic Communications Privacy Act (ECPA). The DDPC argues that the ECPA is obsolete and inadequate for determining government access to electronic communications/data for criminal investigations. The DDPC's work benefits communications companies and their customers by requiring that access to data be determined by a consistent (e.g., across data types) and a due process (e.g., requiring probable cause, warrants, and/or judicial review) protocol. The DDPC works toward its goal through a public awareness campaign and through political lobbying.

There are over 96 groups in the DDPC including the American Civil Liberties Union (ACLU), American Library Association, Amazon.com, Americans for Tax Reform, Association of Research Libraries, AT&T, the Brennan Center for Justice, the Center for Democracy and Technology, Citizens Against Government Waste, Competitive Enterprise Institute, Computer and Communications Industry Association, Dell, eBay, Electronic Frontier Foundation, Google, HP, IBM, Information Technology and Innovation Foundation, Integra Telecom, Intel, Microsoft, NetCoalition, Oracle, Reddit, Salesforce.com, the Progress and Freedom Foundation, Tumblr, and Vaporstream. Over 30 lawyers and professors of law belong to the DDPC. Google executive Richard Salgado has given congressional testimony between 2010 and 2013 in support of the DDPC. Other organizations have attempted reform but DDPC has arguably achieved a wider range and diversity of support.

Reform Attempts

DDPC argues the ECPA has not been modified since its enactment in 1986, when the World Wide Web and e-mail were not widely commercially available to the public and fewer than 350,000 Americans owned cell phones, albeit without today's text messaging, Web surfing, and application downloading capabilities. Since 1986, DDPC argues, communication and technology have become central foci of people's daily lives including e-mail, electronic documents, mobile computing, social media, global positioning system (GPS) technology, and cloud computing.

The DDPC notes that courts apply ECPA inconsistently and with difficulty and this, they contend, leaves Americans susceptible to cybercriminals, sexual predators, and compromised electronic privacy rights. Two examples of legal inconsistency the DDPC notes are how e-mail is subject to different laws based on whether it is being drafted, is opened/unopened, or is being stored by a service provider; similarly, a desktop document may be subject to Fourth Amendment warrant requirement, or possibly not if it is stored in a cloud.

Kevin Bankston, an attorney with the Electronic Frontier Foundation, has said publicly that coalition members disagreed on several issues, though they share agreement on the following principles. First, they would give private electronic communication the same protection as physical files stored in one's home. Also, law enforcement's access to information, they believe, should require appropriate legal paperwork. Additionally, they would protect private information in either transit or storage with access to electronic communication based on probable cause and not whether the content has been opened.

In its stated wish to clarify, simplify, and unify rules for communications service providers, users, and government investigators, the DDPC would allow exceptions for access without court orders in emergencies. The DDPC has also claimed to focus on the most frequently arising issues (e.g., probable cause access to cloud, stored email, or private communications, or GPS/location information, or transactional data).

The DDPC notes that requiring a warrant for documents and private communications was raised in 1998 by the bipartisan team of then-Senator John Ashcroft (R-MO) and Senator Patrick Leahy (D-VT) in keeping with appeals, court rulings, and legal scholarship on the issue. Such proposals are referred to as the warrant-for-content/location rules, as the DDPC wants a search warrant to demonstrate reasonable grounds in an authorized criminal investigation for tracking any mobile device and obtaining transactional or Web site visit data. This is perhaps meant to address the occasional practice of making bulk requests for information on all of a Web site's visitors or all of the online transactions in a jurisdiction to find possible criminal activity; this is sometimes popularly called a fishing expedition.

More recently U.S. Congressmen Jerrold Nadler (D-NY) and John Conyers (D-MI) supported the DDPC's goals by introducing the U.S. Electronic Communications Privacy Act (ECPA) Modernization Act of 2012 that ultimately failed; instead it was referred to committee.

Effects of Reform

A survey by Microsoft that suggests that 90 percent of the population and business leaders care about the privacy and security of their personal data in the cloud seemingly validates the shared principles of the DDPC. As another justification for the need to reform the ECPA, the DDPC argues that the government currently can compel a service provider to disclose e-mail contents over 180 days old with a subpoena and a notice to the user, yet a warrant is required if the e-mail is 180 days old or younger. In response to this issue, the Texas State government passed House Bill 2268 in 2013 with no nay votes in either house of state government. The bill requires a judge's warrant for access to e-mail regardless of age, but it provides no federal coverage. As of June 2013 the bill was awaiting the signature of Governor Rick Perry.

By protecting the privacy of users of communications and technology companies' products and services, reforming the ECPA would arguably profit many of the companies within the coalition. Some sectors of law enforcement and government would arguably oppose reform because the 1986 version of ECPA before reform allows for more or easier access to electronic information.

Some note how the courts are divided on whether access to GPS/location information requires a warrant or a subpoena. The DDPC cites how Justice Department lawyers have previously argued that cell phone customers gave up privacy expectations when they voluntarily gave that information to their carriers/service providers. The DDPC has offered assurances that reforming ECPA would not interfere with national security or prevent companies' use of consumer data for marketing purposes.

Digital Government

Digital government first emerged in the mid-20th century, when computers were introduced into the public sector. Since that time, digital government has moved through a series of overlapping phases, variously emphasizing service delivery, information sharing, and democratic engagement. As low-cost, networked, and widely used communications platforms, social media have potential applications for all of these functions. Likewise, social media offer governments novel platforms for internal collaboration, with the capacity to link civil servants across and within various departments and agencies. Accordingly, a number of governments have developed both external and internal social media initiatives, along with policies governing the use of these technologies by the civil service.

While some are hopeful about social media's capacity to produce more participatory, transparent, accountable, and effective governments in the digital age, the role of social media within the public sector has, as of yet, not been the subject of rigorous empirical analysis.

Early Digital Government

Computers were first introduced to the public sector in the 1950s and 1960s. Soon after this, academics theorized that the computerization of government would have dramatic effects on both the policy process and on the organization

of public-sector bureaucracies. As they argued, computers would bolster information processing capacity and disrupt established power structures and organizational forms. However, by the 1980s, research on digital government largely betrayed these predictions. Captured most famously by James N. Danziger and colleagues' reinforcement thesis, these studies suggested that computers tended to reinforce rather than undo established dynamics in the public sector. While perhaps not as influential as initially predicted, computers, and with them information databases, intranets, and office-related software programs, nonetheless continued to play roles in the day-to-day internal operations of governments from the 1960s onward.

Online Service Delivery

The advent of the World Wide Web in the 1990s introduced new opportunities for government–citizen interactions. Seeking cost savings and improved customer experiences, governments initially focused their efforts on the Web's applications to service delivery. Using their Web sites, governments shared information about their departments and agencies and offered guidance on how to access public services. With time, governments focused not simply on the Web as a platform for sharing information regarding services but also as a platform on which those services could be delivered. For example, some government Web sites now allow citizens to pay fines, file taxes, and register changes to personal information.

With a typically lower per-transaction cost than telephone, mail, and in-person options, online transactions are appealing to governments. That said, the public sector has not always proven itself capable of effectively managing contracts with the private-sector information technology (IT) firms whose systems support these online transactions. Given the high costs of these contracts, and in certain cases the high failure rates of online service initiatives, governments—and the academics, journalists, and members of the public who criticize them—have found reason to doubt the value of new IT projects that promise massive savings and improved services. Similarly, online service delivery can be slowed by concerns over privacy and data security and by

citizens who are unwilling or unable to access services online.

Democratic Engagement

While service delivery was the central focus in the early days of government on the Web (and remains a key focus now in programs like the United Kingdom's Government Digital Service's Digital by Default agenda), many have now turned their attention to the Internet's capacity as a platform for democratic engagement. Initially, this capacity was explored in a relatively ad hoc way as particularly innovative ministers, departments, or civil servants experimented with online consultations and chat forums, blogging, online voting, and e-petitions.

With time, a number of governments introduced more comprehensive and sustained online engagement programs. Coinciding with the rising popularity of social media and phenomena like crowdsourcing, these programs explore how new technologies can support more participatory, transparent, accountable, and effective governments. President Barack Obama's Open Government initiative, the United Kingdom's Power of Information Taskforce, and Australia's Gov 2.0 Taskforce are examples of such initiatives. While largely focused on the benefits that will accrue from public-sector transparency and data sharing (open data), these programs also invoke social media as fruitful avenues for government–citizen engagement.

Social Media in the Public Sector

At present, many governments have developed their own social media (such as blogs) in addition to joining third-party sites like Facebook, Twitter, and YouTube. Typically, governments employing social media do so for the following reasons:

- To support deliberative exchanges between government and the public
- To share information about policy and services
- To solicit and collect public feedback on policy and services
- For crisis communications (e.g., during a natural disaster or a security threat)
- To advertise job openings in the public sector

- For social marketing (i.e., using marketing tactics to promote a socially beneficial outcome, such as healthy eating campaigns)
- To collect data in support of policy analysis or service delivery

As the above list demonstrates, even though public-sector social media use first emerged amid discussions of the Internet's role in democratic engagement, in practice social media serve a range of ends within the public sector, including the more established service function of earlier digital government.

In addition to their applications within this range of government–citizen interactions, a number of governments are employing social media internally to support information sharing and collaboration among civil servants. In some cases, third-party public platforms like Blogger, Twitter, and WordPress are used as forums for civil servants to share information and network with colleagues. In other cases, governments are developing their own internal social media tools. For example, the Canadian federal government has developed a cross-government wiki. Titled GCPedia, this wiki enables civil servants to share information, collaboratively build documents, discuss work-related issues, and network in a secure environment. Social media tools that support collaboration may prove particularly valuable when addressing complex, overlapping policy issues that demand the input of various units across government. Similarly, tools like wikis may enable governments to retain valuable corporate information that might otherwise remain restricted to an individual computer's hard drive or with employees who leave or retire from the civil service. Due to a lack of empirical research, however, it is difficult to discern the extent to which these benefits have accrued as a result of governments' internal use of social media.

Governing Public-Sector Social Media Use

As departments, agencies, and individual civil servants adopt social media, governments have recognized the need for policies governing their use. Typically, these policies address issues such as threats to IT security imposed by social media use; privacy concerns arising from government–citizen

interactions on social media; social media's capacity to accommodate official state languages and those with disabilities; the definition of an official government spokesperson in online environments; ownership of government content on social media; and information management in social media environments. In some cases, governments must negotiate tailored terms of service agreements with popular social media sites to ensure that they can use these sites while also complying with existing government policies. In addition to policies governing how civil servants use social media in professional capacities, some governments have developed policies governing civil servants' personal use of social media. Typically, these policies attempt to ensure that civil servants' personal use of social media does not betray their commitment to political neutrality and professionalism.

Digital Media Law Project

Formerly known as the “Citizen Media Law Project,” the Digital Media Law Project was created in 2007 by four scholars to support independent online journalism and media. The Digital Media Law Project (DMLP) asserts that it contributes to the progress and maintenance of online media sources by providing individuals and organizations with the education and legal resources necessary for protection. The goal of DMLP is to encourage proactive thinking about online publication and the law.

Citizen media, a term coined by Clemencia Rodriguez, refers to media content produced by citizens, or nonjournalists, and distributed through various means to the citizen’s community. The use of online media as a means of communication is not limited to citizens: since the start of the project more corporations and industries have adapted to the rise in social media and begun utilizing these media. As more commercial interests began using social media, members of the Citizen Media Law Project changed the designation of the project to its current name to reflect the expansion of digital media content.

The Digital Media Law Project is hosted by the Berkman Center for Internet and Society at Harvard University. The Berkman Center is home to research initiatives exploring the development of cyberspace. The DMLP was inspired by the information gap between traditional news outlets and online journalism and media. As the number of independent online ventures increased, so did the need for legal protection to ensure the security of such ventures. Independent initiatives differ from professional news organizations that have resources available to obtain legal advice and/

or counsel when presented with legal challenges. Seeing the need for legal assistance by individuals and organizations exploring the realms of online journalism and media, the founders of DMLP began researching and creating means to meet the demand for legal assistance.

The four founders of the Digital Media Law Project are David Ardia, Dan Gillmor, Matt Lovell, and Phil Malone. With backgrounds in a variety of legal fields, the founders came together at the Berkman Center with a common interest—the role of law in communication. As a faculty associate at the Berkman Center and associate professor at the University of North Carolina (UNC) School of Law, David Ardia served as the first director of the project. Ardia’s connection to the Berkman Center arose through his pursuit and completion of a LL.M. from Harvard University. Dan Gillmor serves as the director at the Knight Center for Digital Media Entrepreneurship at Arizona State University. Gillmor began his career as a journalist in the 1980s. Over the course of his career, he has worked with the *Detroit Free Press*, *Kansas City Times*, and *San Jose Mercury News*. In 2005, Gillmor cofounded a Web site for the San Francisco Bay area that is now part of Backfence.com’s “hyper-local” community sites. Matt Lovell is an alumnus of Harvard Law School and a partner of Kirkland & Ellis LLP in a Chicago branch. He worked for the Berkman Center by serving as the former assistant director of the Clinical Program in Cyberlaw. As with Lovell, Phil Malone has a connection to the Clinical Program in Cyberlaw, currently serving as director. Prior to his work at the Berkman Center, he served as a federal prosecutor with focus on the Internet and computer software/hardware. Malone served as primary co-counselor in the *U.S. v. Microsoft Corp.* trial.

As a result of the rise and development of technology, members of the Digital Media Law Project provide legal assistance and practical education for online media. Members of the DMLP recognize the rights that new business initiatives are entitled to under the First Amendment and have developed resources to aid new initiatives through the initial, and risky, stages of development. The project has enlisted a community of attorneys and scholars to respond promptly to legal issues that arise affecting journalism. Legal resources available to the project’s clients include an online legal

guide, threat database, and a 50-state pro bono lawyer referral network.

The three primary goals of the project are to provide legal education and training, litigation and pro bono legal services, and a collection and analysis of legal threats present to the online community. These primary goals are carried out through DMLP's five core initiatives. The project defines its initiatives as "(1) [providing] its detailed Legal Guide on media and business law topics for nonlawyers; (2) [providing] its searchable Database of Legal Threats directed at online publishers; (3) a nationwide attorney referral service, the Online Media Legal Network; (4) a Research and Response initiative to address breaking issues and trends in digital media law; and (5) its regularly updated Blog and Newsletter on current issues in media law, technology law and journalism." The mission of DMLP is carried out through these five initiatives and continual research efforts.

The DMLP's Legal Guide addresses the rights and responsibilities of individuals and organizations using online publication. The guide provides information on many legal issues that may arise as a result of or in reference to online publication. The legal guide is intended for use by citizens, regardless of formal legal training, looking to create items for online publications. The guide can also be utilized by anyone interested in the subject of online journalism and the rights of its creators. The guide is available online through the DMLP Web site. The guide can be searched by key word and browsed by state or by section.

Individuals and organizations seeking to begin new journalism initiatives can benefit from the pro bono legal assistance DMLP has provided the Online Media Legal Network. Launched in 2010, the Online Media Legal Network (OMLN) includes attorneys, law school clinics, and in-house legal counsel from across the United States. The purpose of OMLN is to provide legal assistance at little or no cost to online journalism initiatives and digital media creators.

The Database of Legal Threats provides users with online speech threats including access to previous lawsuits, subpoenas, and cease and desist letters. Users can search the database using full-text search or through categorization of entries. The types of threats available through the database include correspondence, criminal charge,

criminal investigation, denial of access, disciplinary action, lawsuit, litigation, police activity, and subpoena. The project's Web site also provides a threat entry form for any individual or organization faced with a legal threat so that the database can remain up-to-date.

Access to the project's blog and newsletter can be found on its Web site. Following through with its initiatives, DMLP has participated in major First Amendment and intellectual property cases through the filing of amicus curiae briefs. Such cases include *Barnes v. Yahoo! Inc.*, No. 05-36189; *Wright Development Group LLC v. Walsh*, No. 08-2783; and *Barclay's Capital, Inc. v. Theflyonthewall.com, Inc.*, No. 10-1372-CV.

Digital Revolution

In an attempt to cast light on the term *digital revolution*, it is convenient to make a parallelism

with the Industrial Revolution, which took place during the 18th and 19th centuries and had significant consequences on social, economic, and cultural conditions. Certainly, the Industrial Revolution marked a major turning point in history: For the very first time, living standards underwent unprecedented, sustained growth after the transition from an agricultural-based economy toward a machine-based manufacturing one—the introduction of steam power, water wheels, machine tools, and so on. The first Industrial Revolution started in the 18th century and merged into the second Industrial Revolution in the second half of the 19th century with the development of the internal combustion engine and electrical power generation.

The digital revolution has often been referred to as the third industrial revolution and implies the change from analog mechanical and electronic technology to digital technology, occurring since the 1980s throughout the present day. The digital revolution is both a manifestation and result of the emergence of information communication technologies, and thus, inaugurates the Information Age. This revolution entails mass production and widespread use of digital logic circuits and its derived technologies—that is, the computer, digital cellular phone, and fax machines. The important technological, social, economic, and political consequences brought about explain its revolution-like nature. The information society represents the natural environment of this phenomenon.

The Information Society

The term *information society* became popular in 1980 through the work of Japanese sociologist Yoneji Masuda, *The Information Society as Post-Industrial Society*. Masuda recalls the notion of postindustrial society, which was previously coined by Alain Touraine.

As a continuation of the industrial society, in the postindustrial society information is a decisive factor of economic activity. Certainly, a preindustrial society depends essentially on commodities; an industrial society is organized around the use of energy to produce goods; and in a postindustrial society, information—the creation, distribution, use, integration, and manipulation—information technology (IT) is

a key element of the productivity model. Therefore, technologies of information and communication represent catalyst forces, which have pushed forward and enabled changes in politics, in the structure of society, and in work organization. Moreover, people's capacity to get to know global events and react instantaneously through online communication has transformed the international society into a global village. This revolution has marked a new age: the Information Age.

Together with the term *postindustrial society*, the information society is often compared or identified with the following concepts: post-Fordism, superindustrial society, postmodern society, knowledge society, information revolution, liquid modernity, and digital society or network society, among others.

On the whole, new technologies are not only typical features of the information society but also a necessary condition or prerequisite for this society to exist and evolve. Nevertheless, their nature is not democratic: Information and communication technologies have become another element of stratification among people and countries.

Uneven Spread: The Digital Divide

Certainly, there is evidence of striking inequalities in the networked world regarding use, knowledge, or access to information and communication technologies. The digital divide can be referred to as unequal rates of Internet penetration, either among developing and developed countries—the global digital divide—or inside the same country—the social digital divide.

In wealthy countries, access to digital technologies has been much more widespread than in developing countries. The gap is a question of accessibility and of quality of service. For instance, some developing countries might be constructing infrastructures to expand new technologies. Yet, they might have rejected fiber optics—which transmit faster signals—because the technology is more expensive than slower cable. Economic development appears as one explanatory variable of the global digital divide, which occurs once again between rich and poor societies. Politics is another factor to take into consideration. As a matter of fact, in some African countries, state-owned technological firms have created *de facto*

situations of public monopolies, leading to higher Internet costs for citizens.

Regarding technological disparities inside countries, scholars have concluded that diversification in Internet use in western Europe and the United States has to do with patterns of household income, education, and occupational status. These factors explain as well the uneven spread of “old” mass communications, that is, cable, satellite television, videocassette recorders (VCRs), and fax machines.

Information and communication technologies offer new opportunities to attain higher levels of development. Considering their capacity to reduce many traditional obstacles—for example, time and distance—these technologies have great potential to benefit millions of people. In this light,

technological tools should be available for all in an inclusive information society. Efforts and strategies to mitigate the digital divide should intensify.

Cyberpolitics

New technologies—the Internet, mobile phones, and tablets—have the capacity to strengthen civic society and consolidate democracy around the world. In postindustrial societies, significant institutions of representative democracy—parliaments, political parties, and government departments—have established Web sites where they outline their goals and tasks, post official documents, and release updates and announcements. These Web pages enhance government transparency and accountability. Regarding political

A young indigenous man in Brazil works on a computer in 2010. The computer center was originally set up with the assistance of the U.S. Agency for International Development (USAID) as part of an effort to narrow Brazil's digital divide. In less developed countries, disparities in access to technology have been found to be related to infrastructure cost, political issues, and economic underdevelopment.

parties, online instruments have contributed to fund-raising, to improve management and organization, and to diffuse ideas or publicize electoral programs.

Campaigning and voting have substantially benefitted from the potential of digital technologies. Indeed, the development of social media and digital marketing strategies in the 2008 Barack Obama presidential campaign has transformed the classic mechanisms of political communication. In the recent 2012 presidential election, both candidates—Barack Obama and Mitt Romney—made special emphasis on cyberpolitics.

Electronic voting technology has been improved and become rather popular in the last decade. As a result, countries such as the United Kingdom, Estonia, and Switzerland have implemented this voting system in governmental elections and referenda. E-voting has also been used in Canada's municipal elections and primary elections in the United States and France.

In transitional regimes, digital tools have had a gigantic influence in the promotion of democratic change. The use of Twitter in the coordination of different revolutions and protests has resulted in the term *Twitter revolution*. In this respect, it is convenient to mention civil opposition against fraudulent voting in Moldova (2009), Iranian election protests (2009–10), and the dissolution of authoritarian regimes in Tunisia (2010–11) and Egypt (2011).

Civic engagement and activism have also adapted to virtual societies, maximizing their organizational linkages and networking skills in an attempt, on the one hand, to consolidate democracy in Western civilization, and on the other hand, to promote transition processes in autocratic systems. Finally, one of the most innovative effects of the digital revolution has been the revitalization of direct democracy. Definitely, the interactive capacities of new technologies have enhanced citizen participation and deliberation, creating a sort of virtual agora or digital public sphere where digital citizens discuss matters of mutual interest. In this discursive space, public opinion is formed and exerts influence on political action.

Conclusion

The digital revolution has had a multidimensional nature, reaching the world of politics, finance,

culture, and entertainment; facilitating administrative or commercial transactions; and becoming a fundamental tool in the workplace. In few words, the manifestations can be seen in all orders of life: from reading an e-book, Skyping with a friend living in another country, booking a hotel, buying and downloading music on a cell phone, applying for a job, paying bills and taxes online, sending money from a laptop, holding a Web conference with business partners, or participating in online forums or blogs. The capital impact of the phenomenon explains its revolutionary dimension and scope.

Although people find themselves in a globalized society, the digital revolution is not yet a global, comprehensive revolution: There are still noticeable inequalities in the use and access to modern technologies around the world and even inside developed countries.

In addition, this study has underlined the positive side of digital technologies. However, the new media represent serious dangers and threats—cybercrime. At the same time, they entail real challenges for the law to define new types of crimes and for police forces to establish mechanisms and procedures to capture computer criminals.

There is no need to speculate about supposed tension between representative democracy and direct democracy after digital politics. Direct democracy is not going to replace representative governance. On the contrary, digital techniques can nurture deliberation and discursive methods of decision making, which will invigorate political participation both through representative and participatory channels.

The potential of digital technologies is to be explored and developed throughout the new millennium. The ideal horizon envisaged evokes the concept of technoromanticism: Romanticism is reinterpreted in the new age, attributing to technologies the capacity to enhance the power of imagination, restore the role of genius, and bring about unity.

DipNote

DipNote is the first official blog of the U.S. Department of State. DipNote was created in 2007 during the George W. Bush administration with Condoleezza Rice as secretary of state. The blog was created with an American public in mind as a part of government public affairs efforts. The idea behind the blog’s creation was to bring transparency to the State Department’s activities, educate people about its work, and create space for open and constructive dialogue. The blog came alive on September 25, 2007, with a first post by then spokesperson Sean McCormack.

In 2009, DipNote was reformed with the launch of the 21st Century Statecraft, a new approach to foreign policy through innovation developed by the State Department, which operates within the context of an array of “smart power” public diplomacy techniques initiated by former secretary of state Hillary Clinton. As a result, the objectives

and engagement of DipNote expanded to include frequent reporting on the travels, speeches, and work of the secretary of state as well as dissemination and translation of the president’s speeches and public addresses. This included extensive efforts by DipNote to circulate Barack Obama’s historic Cairo speech, which was translated into 10 different languages.

DipNote partly seeks to challenge the mainstream news media and offer an alternative source of information on U.S. foreign policy by allowing participants to discuss important foreign policy issues with senior officials. However, there is very little interaction between blog authors and commentators, as it appears that DipNote encourages more interactions among readers. Nevertheless, DipNote is a moderated blog with all posts, comments, and questions being reviewed before posting. Sponsored and operated by the U.S. Department of State, it does not, however, represent official government communication. Various bureaus within the State Department supply most of the information posted on DipNote. For example, public affairs officers, who often travel with the secretary of state, are constantly on the lookout for potential content.

DipNote is managed by the Office of Digital Engagement under the Bureau of Public Affairs. The Office of Digital Engagement works across the State Department’s units to organize and update information across numerous social media platforms employed by the State Department, including DipNote. A central editorial board manages the content of the blog by soliciting contributions from numerous authors within the State Department, U.S. Diplomatic Corps, and Foreign Service officers in embassies abroad. In addition to internal staff who post daily updates, moderate comments, and provide daily links to leading news stories in international relations, blog contributors range from ambassadors to operatives.

Expanding the digital presence of the U.S. Department of State, DipNote represents an effort of American government to engage in cyberdiplomacy and public diplomacy 2.0. The blog is a space where the department aims to provide an alternative version of events to mainstream media as well as promote a discussion surrounding U.S. foreign policy using Web-based communication technology and engaging various

publics via social media. Content from DipNote is shared on the official State Department Facebook profile, Twitter account, YouTube channel, Flickr account, Google +, and Tumblr. The blog is structured so that visitors can browse the stories and posts by issues and regions. In addition, a social media dashboard on the home page allows one to see easily most recent tweets, YouTube videos, and photos on Flickr. Such energetic online presence across various social media platforms allows diplomats to more effectively use the power of multimedia, images, videos, audio, and information to inform the American public. For example, DipNote allows one to easily track the diplomatic activity of Secretary of State John Kerry on an interactive travel map and tweet him questions.

Although the general mission of the blog is to manage public affairs and to inform U.S. publics exclusively, the content of the DipNote blog addresses global audiences and often attracts comments from all over the world. In this sense, DipNote becomes a platform through which diplomacy is portrayed publicly, serves as a window to American public diplomacy efforts, and creates a space for global dialogue.

Despite the fact that DipNote generates modest traffic, it attracts visitors from more than 170 countries. The blog is most often accessed from China, Saudi Arabia, Morocco, and Iran. Because the blog offers an opportunity for foreign service officers to inform the public and engage in foreign policy discussions and debates, a significant portion of the traffic could also be originating from American government employees abroad.

Disaster Relief

In recent years, the world has been hit with a series of big disasters, such as Hurricane Katrina in New Orleans, earthquakes in Haiti and in various parts of Asia, the tsunami in Indonesia, and the earthquake and tsunami in Japan. Millions of people worldwide are affected annually by such disasters, and in the United States alone hundreds of people die yearly in such disasters. Due to the rising frequency of natural and human-made disasters in various parts of the world and even at a global scale, there is an increasing need for fast and effective communication about damage and coordination of responses.

In the past several decades information and communication technologies (ICT) have greatly helped such communication and coordination, and in the past several years social media have also provided means of expression and opportunities to aid in situations of disaster. Despite some concern about the legitimacy and reliability of information provided through such platforms, ICT and social media are contributing to sharing, seeking, and synthesizing data, conveying opinions and emotions, and organizing, managing, and synchronizing relief.

Public reaction to natural disaster has become an increasingly politicized phenomenon, made all the more impactful by its amplification via social media multiple leveraging. During election cycles, especially, the human and economic fallout from hurricanes, earthquakes, tornados, floods, and tsunami has become an opportunity for reciprocal finger-pointing within the national media discourse, as opposing parties seek to leverage public suffering by developing critical rhetorical

Both government agencies and citizens are using social media extensively during natural disasters. This survivor of severe flooding in Tennessee used a smartphone on May 5, 2010, to share photos of damage to her home in Nashville on Facebook.

narratives about their opponents' responses and reactions to events and valorous narratives about their own. Although the politicization of disaster scenarios like Hurricanes Sandy and Katrina does not preclude the possibility of there being truth in the accusations of, for example, institutional negligence and/or insufficient government response, the extended mining of such scenarios in order to gain strategic political advantage appears to be a growing trend.

Use of Technology

As disasters affect the welfare of individuals and family groups, as well as the well-being of communities and even nations, they serve as catalysts for innovative uses of computer technologies and social media. As researchers Jeanette Sutton, Leysa Palen, and Irina Shklovski assert, disaster situations are nonroutine events that result in nonroutine behaviors. In times of disaster, people and organizations adapt and improvise to suit conditions as needs demand. Although in the United States and around the world relief agencies have flexible structures that allow them to accommodate the particularities of the situation in order to pursue warning, rescue, and recovery operations, they do not always successfully interact with publics who might be in panic, in doubt, or in expectation of rapid interventions. Such publics often leverage their own networks to ask

for and give input outside of the official reports, and to make critical decisions about, for example, heeding warning and making plans to evacuate.

Computer technology has been useful in emergency and disaster response and relief. Examples include residents' accessing of computers connected to the Internet in public libraries during various Gulf Coast hurricanes in the United States to check for situation updates, look for missing family members, and communicate with loved ones; farmers' usage of a grassroots computer network in their area in the foot-and-mouth disease outbreaks in the United Kingdom to exchange information, talk to each other, and give emotional support; and donors' employment of a broad digital network, with participants from almost 100 countries, after the 2004 tsunami disaster in Indonesia, to identify local needs, check assistance pledges, and make additional contributions.

As technology is advancing, so are the ways in which it is utilized in disaster response. Social media technologies including Internet forums, Weblogs, social blogs, microblogging, social networks, podcasts, instant messaging, and crowdsourcing are becoming the latest tools in the disaster preparedness field because they allow imparting and sharing of information quickly by regular citizens and elected officials while the disaster is still unfolding or in its immediate aftermath. Social media platforms are thus becoming the newest go-to tool in cataclysmic situations.

Examples

In the United States, Facebook, Twitter, Skype, and smartphone apps were actively used to provide real-time situation updates during the 2007 California wildfires, the 2009 Red River flood, the 2009 Oklahoma grass fires, and the 2011 tornado that devastated Joplin, Missouri. With aid from social media platforms, many people from the regions hit by these disasters identified dangers and sought help, whereas others from outside the regions affected by the disasters found information about loved ones living there or contributed to the relief efforts. Designated digital communities to share information and resources were also developed specifically for use in some of these disasters. During the 2007 California wildfires, RuralSite was a short-lived but well-used simple

bulletin board created for a small rural community directly in response to the wildfires, whereas MountainSite became a mature and resourceful online community developed as a place where regional residents could get information.

In 2010, the Red Cross published a research report based on a survey of 1,054 people in the United States about their expectations from and use of social media during and after disasters. The survey data showed that Facebook was the most popular social media platform, with over 58 percent of the respondents maintaining a Facebook account, and also the preferred channel for posting eyewitness testimony or information regarding safety.

Twitter was also high in both current use and user preference for communication in case of a disaster. As expected, the study also showed that the 18-to-35-year-old respondents were more likely to engage in social media activity in a situation of disaster than older people. As Facebook currently has over 1 billion users and Twitter over 500 million users worldwide, it is expected that they will continue to be the predominant media for disaster information and relief in the United States and internationally, although other social media platforms will also be employed in disaster relief.

After the Haitian earthquake in January 2010, many people showed what was happening and shared their personal experiences by posting texts, pictures, and videos on blogs, Facebook, Twitter, Flickr, and YouTube. Within just 48 hours, the Red Cross received 8 million U.S. dollars in donations directly from texts on social media sites.

In China, microblogging through a local site, Sina-Weibo, was used in response to the Yushu earthquake in April 2010. According to a 2011 study, people used this microblogging system for four major purposes in the context of the Yushu disaster: situation update, opinion expression, emotional support, and calling for action.

After the Japan earthquake followed by a tsunami and by nuclear failures in March 2011, residents of the areas affected by the disasters used Facebook, Twitter, and Japanese social networks to keep their relatives and friends as well as the national and the international communities up-to-date, whereas relief agencies also used such networks to provide help where it was needed and to coordinate the aid flow.

During the earthquake in Haiti in 2010 as well as during the disasters in Japan in 2011, social media users constituted a volunteer base through Ushahidi, an application which allows the creation of maps of first respondents in disaster zones. Additionally, in the Japan disaster over 8,000 social media reports allowed the creation again through Ushahidi of a large map with details about shelters, food stores, cell phone charging centers, and road closures. Other crowdsourcing tools such as OpenStreetMap and GeoCommons were also utilized in disaster relief in these contexts to help match needs with resources.

Analysis

As social media are being utilized for communication and coordination in situations of disaster, reflections about their uses, opportunities, and challenges have also begun to emerge. In the United States, a 2011 Congressional research report argues that the use of social media for emergencies and disasters may be conceptualized as two broad categories: a passive use to disseminate information and receive user feedback via incoming messages, wall posts, and polls; and a systematic use as an emergency management tool.

The systematic use might include conducting emergency communications and issuing warnings, receiving and responding to victim requests for assistance, monitoring user activities to establish situational awareness, and using uploaded images to create damage estimates. The report states that the passive use represents the way in which emergency management organizations, including the Federal Emergency Management Agency (FEMA), currently employ social media, whereas the systematic use should be a goal for such organizations. The report finds, however, that many problems regarding use are at least partially due to the emerging state of the social media.

Recommendations

This congressional research report also outlines several lessons learned or best practices regarding the use of social media for emergency management and relief administration purposes. These include the need to identify target audiences for the applications, such as civilians, nongovernmental organizations, volunteers, and participating governments; the need to determine appropriate

types of information for dissemination; the need to disseminate the information of most interest to the public; and the need to identify any negative consequences arising from the application and work to eliminate or reduce such consequences.

According to the report, the negative consequences that can arise from use of social media platforms in disaster relief include instances of inaccurate information (e.g., after the 2011 disasters in Japan tweets about persons who were considered disappeared were retweeted even after the victims had been found), malicious activities (ranging from mischievous pranks to acts of terrorism), technological limitations (such as those related to power outages), administrative cost (regarding polling and feedback and also regarding data storage and compilation), and privacy issues (about the potential for the collection, retention, and data mining of personal information by the federal government with respect to its use of social media for disaster recovery purposes).

FEMA has taken into account such considerations as those outlined in the congressional research report, and in 2011 it implemented social media strategies into its emergency management plans. Additionally, the U.S. Department of Homeland Security announced that it will revise its terrorism advisory system, including a provision for alerts to be sent out over social media networks “when appropriate.”

FEMA and the Federal Communications Commission, along with the mayor of New York Michael Bloomberg, also unveiled in 2011 PLAN (Personalized Localized Alert Network), the first geographically targeted emergency notification system in the United States, which sends free emergency alerts to enabled mobile devices to warn citizens of imminent threats in their area. In other countries, similar attempts to integrate social media into disaster relief are being made by various governmental bodies and nonprofit organizations.

Documentaries, Social Media, and Social Change

Documentary films and videos have always combined the emotionally involving strengths of narrative storytelling with compelling situations presented by actuality. They use the strength of authentic presentations from the real world with all of the emotionally compelling structures of storytelling in order to situate the audience in a

specific relationship with the subject. This relationship should lead to a deeper understanding of different social circumstance as a result of having seen the documentary. But the challenge is that seeing a documentary does not equal the same thing as doing something about the issue the documentary discusses. The challenge faced by documentary filmmakers is not just to be understood as a filmmaker but also to be able to present issues in such a fashion that the audience feels motivated to act on them.

Through a history of advocacy documentary, journalistic documentary, and independent production, attempts to reach audiences and instigate both understanding and social change have grown. The advancing quality and gradually declining costs associated with production have helped to multiply the range of voices that use documentary in these ways.

Social Media

Through more recent developments in interactive computer networks, social media presents new opportunities to connect with audiences. Through the Internet's ability to add context, interactivity, and linking, a viewer's opportunity to take action is enhanced. In some cases, the interactivity extends to organizational action, where a geographically diverse group with common interests may be inspired by online documentaries to take collective action and work toward social change.

Networking through social media has also created the possibility of crowdsourcing production opportunities through fund-raising that takes place specifically to finance a film (on Web sites like Take Part, Kickstarter, and others). Some producers and directors are even implementing their efforts as cross-platform efforts, where the documentary film at the center is connected to peripheral activity and networked groups through events, Web sites, podcasts, etc.

History

Getting to this point has required an increasingly diverse set of notions of the function and conventions of documentary. The history of documentary that most viewers are not actually that aware of consists mainly of documentaries adopting an advocacy position. Most of the historical figures significant to documentaries, such as John

Grierson, argued that the documentary form was a way of saving democracy from a trend in public participation that had become perfunctory, apathetic, meaningless, and often nonexistent. In the 1920s and 1930s, Grierson thought that the dramatic power of documentary would help citizens to function with more passion and vitality; in other words, documentaries have the narrative power to spur people into social change.

While many viewers are aware of the more journalistic approaches of recent decades, this has followed a less well-known history of advocacy in documentary. Sometimes this was on behalf of governments; for example, the Nazi-era *Triumph of the Will* (1935) or the U.S. "New Deal" films of Pare Lorentz, such as *The Plow That Broke the Plains* (1936) and *The River* (1938). Sometimes this was done for independent causes, such as the 1937 production of *The Spanish Earth*, designed to inspire support for the agrarian anti-Fascists in Spain, assembled with the participation of Joris Ivens, Ernest Hemingway, John Dos Passos, Lilian Hellman, Dorothy Parker, Archibald MacLeish, and Orson Welles (as a narrator in an early version).

In the network TV era (1950s until the mid-1980s), networks would mostly broadcast documentaries from their own journalism divisions, with a more restricted intent to inform, rather than aspiring to the larger goal of inspiring social change. However, the power of exceptional films like Edward R. Murrow's broadcasts on Joseph McCarthy (*See It Now*, March 9, 1954) and migrant farm workers (*Harvest of Shame*, 1960), or Robert Drew's work on the John F. Kennedy campaign (*Primary*, 1960) would profoundly change social attitudes and occasionally result in legislative change. But these were documentaries operating out of a journalistic mode.

Between Grierson's writings in the 1930s and the rise of television journalism in the 1960s documentary had been taken as something resembling journalism. Audiences expected that what they were seeing were objective stories, not advocacy. But a greater reevaluation of documentary was taking place in the last decades of the 20th century. Filmmakers like Frederick Wiseman, Barbara Kopple, Errol Morris, and Michael Moore benefited from the idea that documentary could be both observation and advocacy, where

Documentary filmmaker and activist Michael Moore advocating for a single-payer health care system in the United States at a Washington, D.C., event sponsored by the nonprofit organization Public Citizen on September 29, 2009.

audiences could be informed, could be shown to see the world differently, and could potentially act on that difference. Simultaneously, this reevaluation saw an increase in the popularity of documentary film as a theatrical experience.

Developments in independent documentary film separate from television had a greater ambition to directly provoke an audience into action. An instance that demonstrates the extent to which documentary could spur social change came as a result of Frederick Wiseman's 1967 documentary *Titicut Follies*. This film was an exposé of the Bridgewater State Mental Hospital in Massachusetts. Its footage was disturbing enough to cause the film to be suppressed for a number of years, with viewing restricted mostly to lawyers, doctors, and health care professionals. The film is considered to have had a direct effect on the closing of Bridgewater. Relatives of patients who subsequently died claim that if the film had been in wider release their relatives might have had a better outcome. The idea that this documentary

could spur change in the way that the mental health industry conducted itself was exactly the kind of thing that Grierson argued documentary could accomplish.

Public screenings played a great role in distribution in the 1960s and 1970s, where a number of antiestablishment films were circulating to a highly mobilized audience of antiwar protesters. The 1968 film by Emile de Antonio *In the Year of the Pig* was highly influential, and earned an Academy Award nomination for Best Documentary. A group of 19 filmmakers known as the Winterfilm Collective collaborated on the 1971 documentary *Winter Soldier*, also advocating against the Vietnam War. These were followed by *Hearts and Minds* in 1974, which won the Best Documentary Academy Award. One of the members of the Winterfilm Collective was Barbara Kopple, who went on to make *Harlan County U.S.A.* in 1975. The film is notable because many of the striking miners depicted in the film believe that the presence of the film crew helped to bring a faster end to the strike.

Errol Morris in 1988 made *The Thin Blue Line*, which relayed the case of Randall Adams, who had been accused of murdering a trooper in Texas. Morris's film indicated that Adams was largely being railroaded, and his conviction and death sentence were actually hiding the real murderer. Reaction to the film and surrounding publicity led to Adams being exonerated.

Michael Moore

Michael Moore's first major film was the 1989 *Roger and Me*. Moore included himself as a character advocating on the side of the labor unions opposing the corporate interests of large auto companies that were slowly destroying Flint, Michigan. Moore subsequently made *Bowling for Columbine* in 2002, an extremely influential documentary about the nature of gun culture in America. He then made *Fahrenheit 9/11* in 2004, which remains the highest grossing documentary of all time (as of May 2013). This film was an extended critique of America during the Bush administration following the attacks of 9/11. Moore remained a character who adopts an advocacy position against the U.S. government.

The advocacy positions that Michael Moore has adopted have been translated to social media

events. Moore claimed that if people could actually see the damage done to the bodies of the children of the Sandy Hook massacre they would immediately change their positions on gun rights and the National Rifle Association; he based this on his understanding of the effects of photographs of Emmett Till's body and the images of the 1965 Selma police attacks on African Americans that subsequently bolstered support for the 1965 Civil Rights Act.

Moore has a large number of social media followers (in the millions). With every new 10,000 followers he gains, Michael Moore gives \$1,000 to a charity chosen by one of his followers. Moore believes that the communication of images of brutality and violence through social media would actually have a positive effect on the way people relate to events and instigate social change.

Other Approaches

Moore's films have capitalized on the popularity of theatrical releases of documentary films as a way of instigating social change. A slightly different approach has been taken by Robert Greenwald and his company Brave New Films. Their projects have included the 2004 documentary *Outfoxed: Rupert Murdoch's War on Journalism*, 2005's *Walmart: The High Cost of Low Prices*, and the 2006 documentary *Iraq for Sale: The War Profiteers*. Greenwald and Brave New Films have capitalized on distribution through social media of documentary materials. He releases material in shorter pieces on the Internet, where they have collectively received over 50 million views. Brave New Films has also used sales to individuals who host house party viewings as another way to get viewers in touch with each other, increasing the possibilities of collective social action.

The plummeting prices of cameras, the ubiquity of simple editing platforms, and a higher general level of media awareness (if not media literacy), plus the ability to distribute through YouTube and online sites have led to an explosion in the production of documentaries. The challenge for the filmmaker now is standing out in the crowd. The challenge for the viewer is deciding which of these stories is worth paying attention to and what kind of action to take as a result of seeing them. And the challenge to social change is having a large enough niche of viewers to reach a critical

mass, and to incorporate paths of action that can connect a documentary to social change.

Some more traditional documentary outlets, like the Public Broadcasting Service (PBS) series *POV* and *Independent Lens*, have developed positions for people who coordinate both outreach and education efforts. Nonprofit organizations that have experience in the development of educational materials have also gotten involved. The Rockefeller Foundation awarded \$975,000 to Columbia University's Teacher's College to develop a multidisciplinary curriculum guide and a Web site to support the teaching of Spike Lee and HBO's *When The Levees Broke*, a multipart documentary about Hurricane Katrina. The grant included the distribution of 30,000 copies of the film along with the curriculum book to educators. The Web site remained active though most of 2010, and offers a place where the curriculum materials can still be downloaded free.

A similar effort is underway through Facing History and Ourselves, which develops teaching materials to combat racism, anti-Semitism, and prejudice. It developed curriculum materials for the Marco Williams film *Banished*, about the historical effects of the banishment of African Americans from several towns in the first decades of the 20th century. The materials are freely available online.

Other documentaries are trying to use social media to develop transmedia platforms with a particular documentary or set of documentaries at the center. Top Documentary Films, DocumentaryWIRE, and Films For Action offer collections of both short and full-length documentaries online. Over 20 years of growth, Witness, an international nonprofit organization, has offered a combination of social documentaries, with a variety of educational materials to teach visitors to its Web site how to make documentary projects, all built on the action of using the documentation of human rights abuses to help curtail them.

Kony 2012

A visible recent example of the interaction of social media and documentary—for better and worse—came with the campaign and film known as *Kony 2012*. In March 2012 the organization Invisible Children released a 30-minute film that

sought to make African war criminal Joseph Kony widely known. The film spread virally and received 94 million views on YouTube, along with 17 million views on Vimeo. The film was tied to a social action campaign, a Web site, and the distribution of posters, T-shirts, and stickers to publicize Kony and his human rights abuses. In the months after its release, the film was widely discussed, both in positive and negative terms. The film was moving and easy to watch, causing an emotional resonance in viewers. At the same time, the film was widely criticized for its manipulation, inaccuracies, oversimplification of political issues, and ultimately misguided efforts. There were short-term gains in international attention and criticism of Kony and his recruitment of child soldiers, and international aid for efforts to apprehend him. But these efforts, as of this writing, have not achieved their central goal.

It remains to be seen whether *Kony 2012* was a fluke incident or a sign of what might be possible in the interaction of documentary and social media. It is also still not clear whether the general arc of the campaign was primarily an example of “slacktivism”—offering online participants an opportunity to do something that seems like social activism, but actually accomplishes little beyond a feeling of accomplishment.

Conclusion

Organizations like the Center for Social Media at American University are attempting to develop methods for better understanding what is considered successful in the relationship between documentary and social media. As larger numbers of documentary productions are chasing after more elusive sources of financial support, what counts as a worthy investment in this relationship becomes critical. At the same time, the differences in form that are affecting the understanding of documentary—a culture’s documentary literacy—remain an area in need of additional study.

Domestic Surveillance and Social Media

Domestic surveillance is surveillance by the government (especially the federal government and its intelligence agencies) conducted within the United States and its territories, and in particular surveillance of American citizens and legal residents. Surveillance techniques include surveillance by human operatives (the proverbial unmarked van, as well as discreet interviews of parties of interest, searches of property and vehicles, and other means), cameras and other recording devices, satellite imagery and aerial surveillance, and many forms of electronic surveillance. Electronic surveillance is sometimes referred to as wiretapping, which originally referred literally to the act of listening in on telephone conversations via accessing the telephone wire, but which has been extended to include other

means of monitoring telephone calls, information transmitted by telephone wire, and all online conversation and activity, from e-mails and text messages to Web browsing and downloads. Wiretapping can sometimes also refer to, and surveillance would certainly include, the monitoring of activity online that may not constitute “conversation,” such as Web browsing, downloading of images or information, Facebook activity (including profile information and pages “liked”), and so on.

Development

Domestic surveillance has always been a concern of the press, who in the course of their work must regularly deal with confidential information and cloaked sources. In 2013, these extant worries were exacerbated by a relationship between the government and investigative journalists made increasingly tense by incidents like the Justice Department’s subpoenas of reporters’ phone records and the detaining of *Guardian* columnist Glenn Greenwald after breaking a story on NSA surveillance. One online news site, Groklaw, even ceased operations over surveillance concerns. Social networks have been key to surveillance since before the Internet, when part of the process of creating a profile of a subject included mapping his or her social network—a visual presentation of information about the people the subject knows and has contact with, with both subjective and quantitative information about each of his or her relationships to these people. Such social network maps could reveal information that could prove to be useful: two parties who might seem to be unconnected might prove otherwise after being mapped. Phone records may indicate calls between two suspicious parties who have no apparent innocent reason to know each other, for instance.

Modern social network analysis incorporates far more information than was used in the past—whenever possible, the amount of information greatly exceeds what a human agent could be expected to keep track of. Data mining is then used to search for useful information and patterns that would once have required an intuitive leap to perceive. Data mining in this informal sense refers to the collection, extraction, and analysis of large sets of data by software designed for the purpose, using data management and preprocessing, visualization, interestingness metrics, pattern mining

through association rules, grid computing, and other techniques. (In computer science the term is somewhat more specific.) It is especially used to refer to these processes in such cases as when the sets of data are so large that extracting information from them manually would be prohibitively laborious. The use of data mining makes it practical to collect and maintain large amounts of data which, were they to be analyzed manually, would be too much of a nuisance to be useful, and in this fact is the principal difference between domestic surveillance then and now.

Modern social network analysis, when conducted by the relevant agencies in the federal government, draws on information from social network sites like Twitter and Facebook, traffic analysis from the National Security Agency’s (NSA) phone call database, and such information as purchase records and whatever has been uncovered through other means of surveillance. Specialized data mining software has been developed for this purpose—AT&T’s Hancock, for instance, was developed to data mine customer information in order to generate marketing leads, but the social network connections that it unveils have been repurposed for the intelligence community’s use.

Social Network Analysis Research

Government entities like the Department of Homeland Security and the National Security Agency are at the forefront of social network analysis research. It and related technologies and techniques like data mining are among the most actively developed technologies and can be expected to remain so for some decades to come. Because so many threats to national security come from decentralized extremists—the Boston Marathon bombers, Tamerlan and Dzhokhar Tsarnaev, for example, or the attempted 2010 Times Square bombing by Faisal Shahzad—social network analysis can be critical.

The monitoring of social media becomes attractive to the intelligence community because suspects flock to social media as a place to exchange information less conspicuously than through in-person meetings. In other words, the use of social media to avoid surveillance makes social media a target for surveillance. However, in truth the wealth of information that can be uncovered through social media surveillance would make it appealing to the intelligence community regardless.

Concerns about domestic surveillance and the new forms it would take through technological advancements in the 21st century first focused on the Defense Advanced Research Projects Agency's (DARPA) Information Awareness Office (IAO) and its Total Information Awareness goal. The IAO was formed in January 2002, combining several DARPA projects in order to address the government's new priority on surveillance and security in the immediate post-9/11 months. IAO is especially concerned with asymmetric threats—those threats which, like most modern terrorists, differ radically in scale and strategy from the United States. The goal of Total Information Awareness would be met by assembling a database of all Americans and U.S. residents, including personal information and online and offline activity, in order to create a block of data that could be mined to search for threats. Columnist William Safire spoke out vociferously against the IAO, and public and media criticism mounted until the program was defunded the following year.

NSA

The NSA's domestic surveillance program, referred to in the government documents that initiated it as the President's Surveillance Program, began shortly after the 9/11 attacks. Much of the program remains classified, and what is publicly known is largely the work of whistle-blowers and the occasional factoid revealed during a congressional investigation. Though some suspected its existence, most Americans had no inkling of it until the *New York Times* published an exposé in 2005 on domestic wiretapping conducted by the NSA without warrants. The lack of a warrant, with the checks and balances it implies, was the major point of concern.

It became clear with time that an additional point of concern for privacy advocates was the underlying reason for permitting warrantless surveillance: the purpose of the program was not limited to targeting persons of interest, but to identifying persons of interest. A warrant requires identifying a suspect in some form. What the new program did was capitalize on modern technology and the dense bricks of information it produces about peoples' activities for a variety of uses, some strongly suspected, some confirmed,

including collecting information for later use (in order to provide the intelligence community with the ability to quickly build a profile for a newly identified person of interest), and searching for patterns of suspicious activity in order to alert human agents to the need for further investigation, much as software detects suspicious activity in order to alert human personnel to the possibility of actions ranging from password hacking to money laundering.

In addition to telephone call data, the NSA program monitored Internet traffic in real time, including e-mail and social media activity, as well as Web browsing, downloads, and other activity. The original program ended in 2007 under public pressure, but was resumed sometime shortly after the passage of the FISA (Foreign Intelligence Surveillance Act) Amendments Act of 2008, with the FISA court officially reviewing surveillance programs and procedures. Arguments continue about whether the program violates Articles I or II of the Constitution, Fourth Amendment protections, or restrictions on the War Powers Resolution, among other issues. The view of many is that the legal argument itself is convoluted in part because the body of privacy and surveillance law simply has not caught up to the capabilities of technology: there are few privacy or surveillance laws, or court decisions in the relevant area, that are contemporary to the technology at the heart of the matter.

According to a report by privacy advocacy group the Electronic Freedom Foundation, the NSA constructed a \$2 billion data center in Utah, which went fully operational in September 2013, housing over 11 years of data collected by Narus Semantic Traffic Analyzers (which intercepted and copied Internet traffic as it happened, in essence wiretapping the Internet as a whole) and other hardware.

PRISM

A more recent revelation is the existence of the PRISM surveillance program, an electronic data collection program operated by the NSA since 2007, supervised by the FISA court, and revealed to exist in June 2013 thanks to the whistle-blowing of NSA contractor Edward Snowden, who subsequently sought asylum overseas. The exact parameters of the PRISM program are unclear.

They were originally alleged to include warrantless demands for customer records from telecommunications companies and social media companies including Google, Facebook, and Apple.

The government has asserted that the program is not used on domestic targets without a warrant, while individual companies have denied knowledge of the existence of the program, or of backdoors providing government agencies with access to their databases. Many in the media remained skeptical of the defenses following Snowden's accusations (accompanied by documentation), with the *New York Times* announcing that the Obama administration had no credibility on the issue. The assurance that the FISA court reviewed the process was challenged by a former FISA judge, James Robertson, who criticized the procedures of the court and its usefulness as an overseer.

Dooiced

Dooiced is a term that refers to being terminated from a job because of something one has posted on a personal blog or Web site. The word originates from the personal blog Dooce, written by Heather B. Armstrong. In February 2001, Armstrong began blogging about her personal life and work experiences, although she did not refer to her company or coworkers by name. A year after Armstrong began blogging, someone anonymously tipped off the vice presidents of the company for which she worked. Armstrong was then fired for making disparaging remarks about her colleagues and employer on her blog. Armstrong may not be the first person to lose a job because of their blog or Web site, but as a prominent and vocal member of the early blogging community, her blog became synonymous with these firings.

Following Armstrong's termination in 2002, several other bloggers were fired because of their blog content, including Mark Jen, fired from Google for blogging about Google's employee orientation process, and Ellen Simonetti, who was terminated from her position as a Delta Airlines flight attendant for blogging photos that the company deemed inappropriate. Simonetti later filed a sex discrimination lawsuit against Delta Airlines, claiming inconsistency in its treatment of employees' online postings. These and other firings ignited a debate about workers' rights to free speech and privacy, a debate that continues as blogging and social networking become a more ubiquitous part of individuals' daily lives.

Blogging and social networking have blurred some of the boundaries between public and private, as comments that may have gone unnoticed and unreported in a face-to-face conversation leave a digital footprint when posted online. However, as blogs and social networking sites have gained popularity, they have also become a part of corporate culture, facilitating interaction between colleagues and allowing companies to reach out to clients by creating and maintaining an online presence. The blurring between public life and private life alongside the need for social media use in the workplace creates the potential for employees to post defamatory or harassing content for which employers may be liable. Accordingly, some employers monitor their

employees' activity on blogs and social networking sites, resulting in numerous terminations due to workers' online activity.

In the United States, most employees are employed at-will, meaning they can be terminated at any time and for almost any reason, provided the reason does not violate state or federal law or a contractual agreement. As part of the doctrine of employment at-will, employee monitoring is legal in many forms, both inside and outside of the workplace. Employers monitor employees for several reasons, including maintaining productivity, protecting trade secrets, and avoiding liability in cases where employees may be in violation of the law. Employees have some limited privacy protections at work, for instance, against wiretapping or in cases in which the employee has a reasonable expectation of privacy. However, the law has been slow to respond to changes in technology that allow employers greater scope in their capacity to monitor employees.

The doctrine of employment at-will puts the employee at a disadvantage in disputing claims of being "dooched." Many bloggers, including Armstrong, do not initially intend for their blogs or social media content to be seen by their employers. Employees may be protected in cases in which they have a reasonable expectation of privacy, but regardless of an author's intentions or audience size, because blogs and social networking sites are publicly accessible, users have little reasonable expectation of privacy. Content posted to blogs and social networking sites are archived and traceable, and thus can be used in cases against employees even if the content is published under a pseudonym or on an individual's own time.

Many forms of employee monitoring are legally protected, and many employers actively monitor workers' blogs and social media use. Due to inconsistencies in how employees have been disciplined due to their online activity, many employers have instituted blogging and social media policies to decrease their liability in cases in which employees are fired because of their use of blogs or social networking sites. Social media policies typically contain stipulations against sharing confidential information, disparaging the company, and posting harassing or abusive content. However, there have been some debates as to the legality of some blogging

and social media policies, as the threat of discipline for blogging and social media use could be seen as limiting employees' freedom of expression, and in particular, curtailing workers' rights to organize and improve working conditions.

Passed in 1935, the National Labor Rights Act (NLRA) has historically provided some speech protections for employees, and ambiguity and unequal treatment in cases of termination have raised the question of what constitutes protected speech online. Section 7 of NLRA protects employees' right to self-organization and collective bargaining, allowing employees to discuss wages, hours, and working conditions without fear of termination, while Section 8 makes it unlawful for employers to interfere with employees' Section 7 rights. These laws apply to both union and nonunion workers. Thus, employees' use of blogs and social networking sites to discuss working conditions may include protected activity, so long as the content is not abusive.

The National Labor Relations Board's (NLRB) general counsel has disputed the lawfulness of some blogging and social media policies on the basis that they violate workers' right to organize. The NLRB's general counsel argued that vaguely worded confidentiality and antidefamation policies could potentially curtail employees' rights to discuss wages, hours, and working conditions. The NLRB has called upon several companies, such as General Motors, Target, and Costco, to reformulate their blogging and social media policies. However, the NLRA only protects employee postings related to working conditions.

Downstream Liability, Political Implications of

The term *downstream liability* refers to a practice in which an organization’s network is exploited in order to impair the computing capabilities of another network. The intermediary’s system is used as a stepping stone to gain access to the end target’s system. A fundamental legal issue lies in the determination of the liability of the intermediary organization for any damaging activity targeted at another organization. The organization that facilitates the downstream action could be at fault because of insecure systems, processes, or failure to warn of potential danger. Once an organization is notified that there has been a network breach that could lead to the spread of a virus, liability can arise. Negligence can be found if there is an awareness of a security breach with potentially wider implications followed by a lack of action or notification of the danger.

This leads to a need for organizations to ensure the security of their systems and the effectiveness of internal notification procedures in order to avoid liability. It is often difficult to track down the hackers, the originators of the damaging activity, whereas an intermediary organization, whose lack of oversight may have inadvertently aided that hacker, is easy to identify and sue. The concept of downstream liability is further complicated by the differing legal approaches taken across jurisdictions in relation to the duty to secure a computer system. For example, the relevant legal regimes in the United States and the European Union mandate differing duties and responsibilities in relation to computer security. The laws on this issue also vary in the United States from state to state. The divide lies between regimes that impose no liability and those that enshrine a concept of downstream liability. In

general, the trend is moving toward the imposition of liability for intermediaries.

The concept of downstream liability is important in relation to use of computer systems to raise awareness of a political issue, also known as hacktivism. This practice relies upon the use of networks to highlight political points by impairing systems, and it has been seen as a type of civil disobedience. Such hacktivism is becoming increasingly sophisticated and increasingly relies upon the exploitation of vulnerable systems as a route toward the impairment of other, better protected systems. This phenomenon can lead the political and legislative impetus toward the expansion of the concept of downstream liability to better protect public services. However, there is a need to find a balance that ensures that organizations maintain secure systems while avoiding the imposition of duties that could hinder growth and commercial competitiveness.

Dragonfly Effect, The

Sameer Bhatia was an entrepreneur. He had a successful Silicon Valley business and was living the high life when he was diagnosed with leukemia. At the time, he was 31 years old. Bhatia would need a bone marrow transplant if he wished to survive and beat the disease. Unfortunately, there were few South Asian donors, and as a result,

hope looked dim. Understanding firsthand the potential of social media and networks, he took to the Internet in an effort to solicit more potential donors of the same ethnicity as Bhatia. Over 11 weeks, more than 450 bone marrow drives were held, and approximately 150,000 visitors looked at the Web site devoted to the cause. In the end, more than 20,000 possible donors entered the registry, and one was a perfect match for Bhatia. Unfortunately, he did not survive his illness, but thanks to his social media efforts, 266 patients were matched with donors enlisted as part of the Bhatia campaign. These events caused Jennifer Aaker and Andy Smith to write *The Dragonfly Effect* in 2011.

The Dragonfly Effect is titled as such due to the dragonfly being the only insect capable of flying in any direction when its four wings are working together. Culturally, the dragonfly means many things depending on where one is located. It typically involves new beginnings or change. Aaker and Smith use these ideas to show how social media can make a large impact when harnessed properly by those utilizing it. Following the metaphor of the dragonfly, the authors use their work to describe the four wings of the dragonfly effect—focus, grab attention, engage, and take action.

The first wing of the dragonfly is focus. Rather than thinking big (which many marketing experts have previously recommended), Aaker and Smith instead suggest targeting a single, clear outcome. All resources should go directly toward this goal. Within the text, the authors suggest setting a goal, breaking it into subgoals, determining how to measure success, and creating a specific plan to use in reaching the goal. In the case of Bhatia, one can see the clear focus: finding a donor match.

The second wing is to grab attention. Once the single goal is decided upon, the main task is to convince an audience to care. Aaker and Smith suggest being original, keeping it simple, making it grounded, and using as much visual imagery as possible. After grabbing their attention, individuals must get their audience primed to take action in support of the single goal. Stories and personal engagement are the key ways by which to do this. Online technologies can prove to be pivotal. Facebook, Twitter, e-mail, text messages, a blog, or YouTube videos can all prove to be successful in implementing an engagement strategy.

The final wing involves taking action. If an individual has set a goal, engaged a chosen audience, and convinced them to care, it should be easy to get them to act. Key in this stage is to keep providing positive reinforcement to those who are doing what an individual is asking. This will encourage others to do the same.

The key takeaway from *The Dragonfly Effect* is that small, integrated activities can cause a ripple effect that leads to greater changes than expected. These changes can have a positive impact. All it takes in the social media era, however, is a wire-less connection to begin implementing change.

Political Campaigns

During the 2000 and 2004 presidential elections, the George W. Bush campaign team reminded America of the importance of word-of-mouth endorsements. Rather than relying on formal endorsements from national politicians, Karl Rove orchestrated an Amway-style campaign in which supporters called their friends and endorsed Bush and urged others to do the same. Rove understood that the best way to sell a product (or candidate) was through word of mouth and that consumers are more open to endorsements from friends than formal pitches. Today, this is even more easily done via social media. In this way, *The Dragonfly Effect* provides campaigns (both candidate and issue-based) with a blueprint for success in tapping social media and psychological insights to see victory in the ballot box.

To see how *The Dragonfly Effect* can be used in campaigns, consider the election of President Barack Obama in 2008. The Obama 2008 campaign was the first to truly utilize social media as a vehicle for possible success. Obama and his team used social media to raise money, advertise events, and empower supporters to be active campaign assistants. Over the course of roughly 15 months, Obama saw nearly 5 million supporters join his cause on a combined 15 social networks. On YouTube alone, he had more than 50 million views on his channel. Other campaigns used social media, but none were successful in creating a culture of involvement and participation. Rather than simply creating the pages and social networking hubs and expecting individual supporters to help them take off, Obama and his team made sure that social media served as a

vehicle to bring together supporters in real time to help bring about the change they desired for the country. Obama allowed supporters to run individual campaigns on their own through the Internet.

Looking at the specifics, the Obama team was successful by focusing all attention onto Barack Obama as an individual. Rather than worrying about policies or politics, the campaign wanted people to get to know Barack Obama, the individual. After doing so, they believed voters would be inclined to agree with him. Next, they assured that Obama was authentic on the Internet. As opposed to Senator John McCain, Obama enjoyed the social networks. He used his own favorite music, interests, sports, and movies. He did not pretend to be anyone but who he truly was. Likewise, his day-to-day updates were easily relatable to all Americans. The conversation seemed to be more about how Obama was like the average American than his activities as a presidential candidate.

Perhaps most important, Obama acknowledged that every single American was capable of helping to create change. A vast majority of the money he raised was in amounts of \$20 or less. By sharing posts and using Facebook walls and Twitter feeds, Obama empowered even the most powerless of Americans to work toward making a difference, and the average citizen responded.

In the most general sense, Obama succeeded in 2008 by following *The Dragonfly Effect*: he created a single, clear goal and put all resources toward garnering the necessary support to achieve it. Obama focused on hope and change—a focused message for the future of the country. He utilized top bloggers and social network specialists (such as Chris Hughes) to assure social media was used properly, and he had a complete map of the digital landscape. He assured authenticity by being himself in all networks. Everything he posted or said was geared toward getting individuals to vote for him and Vice President Joe Biden. And, most important, he embraced cocreation. He allowed average citizens to take his brand and run with it to their friends, family, coworkers, and social networks.

The Obama campaign did exactly what *The Dragonfly Effect* predicted: It took a series of small events and allowed them to collectively lead to

major change in the world. In the aftermath, more campaigns have begun attempting to do the same.

Drudge Report

The *Drudge Report* was one of the first political Web sites to achieve international fame when it broke the story of the affair between U.S. President Bill Clinton and Monica Lewinsky in 1998. Its mixture of politics and gossip paved the way for later political Web sites, including the *Huffington Post* and *Politico*. Founder Matt Drudge considers his publication to be part of the tradition of whistle-blowing, muckraking journalism, and to this extent, the *Drudge Report* also may have influenced the development of sites like WikiLeaks. However, the *Drudge Report*'s unique talent lies in recognizing and publishing small stories from the mainstream press that grow into much larger stories later. The site has little in the way of original content, choosing instead to aggregate content from other publications, and consists mostly of links to other Web sites.

While its popularity has ebbed and flowed over the years, the *Drudge Report* remains one of the top-rated U.S. political news Web sites and among the most popular Web sites in the world, drawing more than 20 million unique viewers per month. Journalists and political pundits recognize the *Drudge Report* as an influential media agenda setter.

Background

Matt Drudge was born in 1966 in Tacoma Park, Maryland. He moved to Hollywood, California, in 1989, where he managed a gift shop at CBS Studios before launching the *Drudge Report*, which started as an e-mail newsletter in the mid-1990s. Hollywood gossip was the focus of the newsletter, but when Drudge shifted to Internet publication in the late 1990s, he turned his attention to politics. In the early days, Drudge has said that he received news tips from entertainment industry sources and sometimes even rummaged through trash bins to get story ideas. Drudge has been both praised for his ability to scoop mainstream news organizations on major stories and damned for recklessly publishing stories that later turned out to be false.

Drudge calls himself a conservative populist, and his publication is consistently listed among the top conservative Web sites. The *Drudge Report* and the conservative Fox News cable TV channel emerged at about the same time.

The Lewinsky Scandal

On January 17, 1998, Drudge broke the news of the affair between President Bill Clinton and White House intern Monica Lewinsky. The story originated with *Newsweek* magazine's Michael Isikoff, but *Newsweek* editors delayed running the story in order to get more verification. Drudge found out about the story and promptly posted it online. Mainstream media coverage followed a few days later. Drudge continued to break new details of the story, which culminated in Clinton's impeachment in December 1998.

Format

While the *Drudge Report* is often considered a groundbreaking online news publication, it has eschewed many social media norms. Other than a form where readers may submit news tips, it has never incorporated user participation into its

site. There are no audience comments, no opinion bloggers, and no way to like or share stories via social media. However, the *Drudge Report* is among the top Internet sites that drive traffic to other news Web sites.

Durbin, Richard J.

Richard J. "Dick" Durbin was born on November 21, 1944. A native of East St. Louis, Illinois, Durbin became involved in that state's politics in 1969, running several unsuccessful campaigns before being elected to the U.S. House of Representatives in 1982. First elected to the U.S. Senate in 1996, Durbin served as Senate minority leader (minority whip) from 2005 through 2007 and as Senate majority leader (majority whip) from 2007 until the present.

Although known for his relatively traditional campaign style, Durbin has come to the attention of many proponents of social media for his sponsorship of a variety of legislation seen as curtailing freedoms, including the Stop Online Piracy Act (SOPA) and his calls for a return to the Fairness Doctrine. Although neither of these proposals has led to incursions in the right to free speech or innovation, Durbin's continued influence and authority make his support for these types of reforms significant.

The son of William Durbin and Anna Kitkin Durbin, Durbin was educated in parochial

schools, graduating from East St. Louis's Assumption High School in 1962. Both of Durbin's parents worked for the New York Central Railroad, and he worked in stockyards and slaughterhouses during the summer to earn money to pay for college. Enrolling at the School of Foreign Service at Georgetown University the following fall, Durbin earned a bachelor of science degree in 1966. While a senior at Georgetown, Durbin served as an intern in the office of Illinois's senior U.S. Senator Paul Douglas. Immediately upon graduation from college, Durbin enrolled in the Georgetown University Law Center, graduating with a juris doctorate in 1969. Moving to Springfield, Illinois, the summer after graduating with his law degree, Durbin passed the Illinois bar exam and began his own law practice that same year.

Beginning in 1969, Durbin served as legal counsel to Illinois Lieutenant Governor Paul Simon, a position he held until 1972. After this, he served as legal counsel to the Illinois State Senate Judiciary Committee, remaining in this role until 1982. Although he ran for a seat in the Illinois State Senate in 1976 and for Illinois lieutenant governor in 1978 (as the running mate of Illinois State Superintendent of Schools Michael Bakalis), Durbin lost both these elections. After the 1978 loss to Republicans Governor Jim Thompson and Lieutenant Governor Dave O'Neal, Durbin began working at the Southern Illinois University School of Medicine as an adjunct professor, all the while continuing his practice of law.

In 1982, Durbin again ran for election, this time winning the Democratic nomination for Illinois's 20th Congressional District, which was centered in Springfield. In the general election in November, Durbin surprised 11-term Republican Congressman Paul Findley, who had first been elected to the seat in 1960. Durbin was successful for several reasons. First, his message focused upon high unemployment rates and financial difficulties facing constituents, resonating with voters in the off-year election who felt that President Ronald Reagan's economic policies were failing. Second, Durbin was able to raise donations from pro-Israel groups across the United States who opposed Findley's push for more equal treatment of the Palestinians by the Israeli government. Finally, Durbin benefited from the 1980 redistricting process, which had redrawn the now-eliminated 20th Congressional

District to include more voters aligned to the Democratic Party.

Once in office, Durbin became known as one of the more progressive members of the U.S. Congress and is acknowledged for having consistently liberal views on most issues. His voting record over the past three decades has been very similar to the Democratic Caucus position. When he first entered the House of Representatives, Durbin supported maintaining pre-existing restrictions on abortion and favored an amendment to the U.S. Constitution that would have nullified the holding in *Roe v. Wade*, 410 U. S. 113 (1973). After 1989, however, Durbin reversed his opposition to abortion and has supported Medicaid funding of the process and opposed any attempts to limit *Roe v. Wade*. Durbin has also consistently favored legislation that restricts access to tobacco and regulates smoking. Durbin's opposition to the tobacco lobby stems in part from his father's death from lung cancer when the future senator was 14 years old. To further this concern, Durbin sponsored legislation in 1987 that would ban cigarette smoking on all domestic flights of two hours or less. Durbin's proposal, which sought to protect the health and safety of nonsmokers and airline employees, was adopted as part of the 1988 transportation spending bill and was extended to all domestic flights, regardless of length, in 1989. Durbin ran successfully for re-election to his House seat six times, handily beating the Republican opposition each time.

In 1996, two-term Senator Paul Simon announced that he would not run for re-election. Durbin entered the Democratic primary for the Senate seat, ultimately defeating future Illinois Governor Pat Quinn for the opportunity to run in the general election. In the fall of that year, Durbin scored a win against Illinois State Representative Al Salvi, winning the election by 15 points in part because of President Bill Clinton's landslide re-election. Durbin quickly rose to a leadership position within the Senate Democratic Party Caucus, as he was appointed the assistant minority leader (assistant minority whip) by Senator Tom Daschle. Following the 2004 elections, in which Daschle was defeated for re-election, Durbin became the first Senate whip from Illinois since Everett Dirksen had served in that position during the 1950s. Durbin served as minority whip until 2007, when the Democratic Party assumed control of the Senate, at

which point he became majority whip. In addition to his service to the Democratic Caucus, Durbin has also served on a variety of committees, including the Appropriations Committee, the Foreign Relations Committee, the Judiciary Committee, and the Committee on Rules and Administration.

Use of Social Media

Durbin uses a variety of social media to communicate with his constituency as well as to publicize stances he is taking on a variety of issues. To this end, Durbin's office maintains a Web page, a Facebook page, a Twitter account, a Flickr account, and a YouTube channel. Each of these has a slightly different purpose and focus. The Web page, for example, not only delineates policy initiatives and legislation Durbin favors but also provides connections for those seeking constituent services, the locations of local field offices, or protections afforded consumers. Durbin's Web page also provides updates regarding the legislative agenda, recent press releases, and stories of Illinois residents.

Durbin's Facebook page contains reminders to vote, links to Web sites and Facebook pages of political allies, and other features relating to constituents, special interest groups, and other issues of concern. His Twitter account sends out two to 10 tweets per day, updating those interested in Durbin's daily routine, speeches, Senate votes on pending bills, and the like. The Flickr account contains Durbin's photostream, which shows the Senator greeting other politicians and guests in his office, Durbin at work on various Senate subcommittees, and him out in the field campaigning and meeting constituents. Finally, Durbin's YouTube channel contains videos of him making speeches on the Senate floor, announcing workshops for constituents, promoting public works projects that will provide jobs in Illinois, and interacting with special guests to his office. Together, these social media sites permit Durbin a chance to connect with voters, constituents, and others in a variety of ways, thus allowing individuals of all ages to interact with him in the manner they feel most comfortable.

Controversy

Durbin has angered some proponents of free speech and Internet communications through his

support of certain legislation and policies. In particular, Durbin has expressed a desire for a return to the Fairness Doctrine, which has alarmed those concerned with free speech and in favor of limited government regulation of the Internet. Durbin has also expressed support for SOPA and has served as a sponsor of the Preventing Real Online Threats to Economic Creativity and Theft of Intellectual Property (PROTECT IP) Act (PIPA). While none of these attempts to limit activity on the Web was successful when first introduced, Durbin's support of this sort of regulation has left some uneasy.

The Fairness Doctrine was a Federal Communications Commission (FCC) policy that was first introduced in 1949. Through 1967, the Fairness Doctrine was applied on a case-to-case basis, after which point it was formally codified as part of the FCC's regulations. The Fairness Doctrine existed until 1987 when the FCC determined that the doctrine was no longer needed, although language referencing it was not removed from FCC regulations until 2011. At its essence, the Fairness Doctrine sought to ensure that viewers of television programming were exposed to a variety of viewpoints related to controversial issues facing the nation. To that end, the FCC required holders of broadcast licenses to make two interrelated commitments. First, the Fairness Doctrine obliged broadcasters to devote a certain amount of their airtime to discussions of controversial topics affecting the public interest. Second, it compelled broadcasters to present contrasting views regarding these topics. The FCC afforded broadcasters a wide degree of autonomy in presenting the controversial topics, and many used editorials, news segments, or public affairs programs to do so.

Although the Fairness Doctrine was repeatedly challenged in the courts, a variety of judicial opinions determined that Congress acted within its discretion in promulgating the requirement. In *Red Lion Broadcasting Co. v. FCC*, 395 U. S. 367 (1969), for example, the court held that when a broadcast station makes a personal attack on an individual, he or she must be given free on-air time to respond to the attacks. As a variety of alternative channels of communication became available, the Supreme Court did begin to question the necessity of the doctrine, but left its fate to Congress. In 1987 the FCC abolished the Fairness Doctrine, which was met by proposed legislation

Democratic senator from Illinois Richard J. Durbin answering questions from bloggers in "The Big Tent," an area set aside especially for new media, including Google, Digg, and YouTube, during the 2008 Democratic National Convention in Denver, Colorado. Durbin has angered some online activists and proponents of free speech through his support of such legislation as the Preventing Real Online Threats to Economic Creativity and Theft of Intellectual Property (PROTECT IP) Act (PIPA).

reintroducing the policy, although this was vetoed by President Ronald Reagan. The Fairness Doctrine was separate and distinct from the equal time rule, which requires radio and television broadcasters to provide opposing political candidates equivalent opportunities to appear on the air.

In 2005, more than 20 members of the House of Representatives proposed the Fairness and Accountability in Broadcasting Act (FABA), which would have restored the Fairness Doctrine as part of the requirement to renew broadcast licenses. Specifically, FABA would have required broadcasters to cover important public matters, hold twice-yearly public meetings to determine which issues to cover, and demonstrate to the FCC that these obligations were being met. Although introduced, FABA was referred to committee, where no further action was taken. In 2007, Durbin publicly suggested a need for the return of the Fairness Doctrine, emphasizing his

belief that open discourse required a variety of viewpoints. Nothing has come of this, however, although conservatives and libertarians continue to oppose any return of the doctrine.

In 2010 Durbin cosponsored the Combating Online Infringement and Counterfeits Act (COICA), which sought to combat media piracy by shutting down Web sites that facilitate such behavior. COICA was criticized by many First Amendment advocates, who insisted that the proposed legislation would foster censorship and harm many for the illegal actions of a few.

The following year, after COICA failed to pass, Durbin served as a cosponsor of PIPA, which was the Senate version of the more well known SOPA. PIPA was designed to prevent or curtail copyright infringement of intellectual property. Infringement was defined by PIPA as the distribution of counterfeit goods, illegal copies, or technology designed to foil digital rights-management

software. The bill was designed to facilitate law enforcement efforts to curtail digital copyright infringement, allowing the U.S. attorney general to seek injunctive relief against Web sites, facilitating such activity. Indeed, after applying for and receiving a court order so permitting, the government would be able to force advertisers, financial institutions, Internet service providers, and search engines to cease all interaction with the rogue site and to delete all links to it.

PIPA and SOPA enjoyed broad support among a variety of groups. Both the U.S. Chamber of Commerce and the American Federation of Labor and Congress of Industrial Organizations (AFL-CIO) supported the legislation, as did copyright and trademark holders in business and industry, along with labor organizations representing their employees. Film studios, record companies, publishers, and a variety of businesses representing traditional means of distribution, such as cable networks, movie theaters, and others who felt piracy was threatening their ability to compete, also supported the measure. Other groups, however, opposed PIPA and SOPA vigorously. Opponents of the legislation asserted that its passage would impede innovation, limit freedom of speech, and impugn Internet integrity. A variety of companies and organizations, especially those engaged in or affiliated with Internet businesses, joined civil libertarians in opposing the bills.

After the administration of President Barack Obama announced that it opposed the legislation in its current form as a potential means of censorship of lawful activity and as a threat to the underlying architecture of the Internet, congressional leadership withdrew the bills from

consideration so that they could further study the problems presented.

As one of the more liberal members of Congress, Durbin continues to receive high marks from a variety of left-leaning advocacy groups such as the National Association for the Advancement of Colored People (NAACP), the American Civil Liberties Union (ACLU), and the National Education Association (NEA) while receiving low grades from conservative advocacy groups. Durbin's passion for protecting the rights of workers and his willingness to accept government regulation may cause him to continue to support efforts to combat Internet piracy.

E

Earned Media

Three types of media exist: paid media, owned media, and earned media. Paid media involves a group purchasing air time or space in order to distribute its messages, such as a commercial during a television show. Owned media involves a group using its own outlets to distribute messages, such as press releases on a Web site. Earned media refers to the dissemination of a group's messages through other outlets for free, such as news media coverage or social media sharing. Political campaigns rely on earned media to engage audiences with their messages.

With traditional media such as television and newspapers, campaigns use formal speeches, enter debates, stage events, create commercials, and write editorials and letters to the editor with the hope that news organizations would do more in-depth stories on them. In contrast, social media allow political campaigns to earn media from both traditional media outlets and individual users. In addition to the traditional events, campaigns use sites such as Twitter, Facebook, YouTube, Tumblr, and blogs on dedicated Web sites. With these options, the campaigns employ short, word-based posts, still images, and videos to communicate their positions and their activities.

Social media make getting earned media even easier than traditional activities did. Part of the

hope behind these activities is that individuals share them with members of their social networks. How these individuals connect with their social networks depends on the possibilities offered by the various Web sites. A “like” on Facebook shows up in a person's newsfeed for his or her friends to see and hopefully prompts those friends to like the same thing. Microblog sites such as Twitter and Tumblr allow users to share others' posts with one click, to comment on them, and to create their own posts. Pinterest allows users to create online pinboards with various images. YouTube channels and accounts host video, and these channels also allow sharing and commenting. After winning the 2012 election, for example, Barack Obama tweeted a picture of himself hugging his wife Michelle Obama and the words *four more years*. In the days following the election, Twitter users retweeted the post more than 800,000 times, setting a record.

The other part of the hope is that traditional news media cover social media activities as well as the previous approaches. Obama's tweet and the record number of retweets became a news item for several media outlets. His campaign's starting a Pinterest account garnered media coverage as well, with some stories even mentioning the chili recipes listed there.

Earned media offer several advantages. First, they offer the opportunity to reach a wider

Barack and Michelle Obama embrace in a photo similar to the one that went viral on Twitter after the 2012 election, becoming the site's most shared photo ever. The photo was taken on August 15, 2012, after a campaign event in Davenport, Iowa.

audience than targeted activities. Second, they help generate interest in the campaign and draw attention to it. Third, they offer an affirmation for those already supporting the campaign through seeing their efforts getting outside attention. Overall, this attention implies an agreement with the campaign's messages.

Earned media also come with challenges, such as standing out in a crowded media environment and losing control over intended messages. Republican candidate for president Mitt Romney learned this lesson when his comments about some Americans not paying income tax and about his views on gay marriage became viral videos. The videos gained traction from individual social media users and from the mainstream press, both in support and in derision of his comments. Once the videos become available and start gaining attention, they become difficult to retract or control.

Further, earned media allow others to insert their own messages into political conversations. During the 2012 campaign, billionaire Donald Trump created a video in which he offered President Obama \$5 million to any charity of the president's choice if Obama produced records such as his passport application and his college transcripts. The video became available to audiences through YouTube and soon gained media and popular attention. Instead of garnering support, though, Trump's video drew criticism.

Not all political activities relate to political campaigns. The group Invisible Children released a video known as *Kony 2012*, which laid out plans for a campaign to raise awareness about the crimes of Joseph Kony, leader of the Lord's Resistance Army in Uganda, accused of kidnapping children and forcing them to serve in his army. The video called for Kony's capture and arrest, and the video quickly went viral across multiple social and traditional media. The video brought attention to the issues, but it also drew criticism for its messages and their execution.

ECHELON

ECHELON is a term associated with an intelligence collection system used by the United States and several of its allies. It is used primarily to sort through communication intercepts. This system is based on a network of computers that automatically search through large amounts of intercepts for preprogrammed key words or addresses. Since the existence of *ECHELON* was first revealed

in the late 1980s, debates have focused as to its potential impact on civil liberties. Similar concerns can be raised about the capabilities that intelligence agencies are developing for the purpose of digital surveillance in the age of social media.

The term *ECHELON* is often used to refer to the widespread surveillance capabilities developed by the National Security Agency (NSA), the U.S. organization in charge of collecting and exploiting signals transmitted from communication systems, radar, weapon systems, or signal intelligence (SIGINT). The *ECHELON* network relies on a series of monitoring stations throughout the world. These are managed by the NSA and its counterparts in a series of partner countries, including the Government Communication Headquarters (United Kingdom), the Government Communication Security Bureau (New Zealand), the Defense Signals Directorate (Australia), and the Communication Security Establishment (Canada).

The origins of the *ECHELON* system can be traced back to the special relationship that developed between the United States' and the United Kingdoms' (UK) intelligence apparatuses during World War II. This was formalized in 1946 when the two countries signed the UK–USA agreement that institutionalized cooperation in the realm of SIGINT. This agreement was later extended to include three second parties: Canada, and then Australia and New Zealand. Later on, third parties such as Norway, Denmark, Germany, Italy, and Turkey also joined the multilateral intelligence cooperation network. Cooperation between these countries played a vital part in the collection of SIGINT on the Soviet bloc during the Cold War. At the end of the Cold War, *ECHELON*, along with other interception systems, was redirected away from the Eastern Bloc to focus on threats such as terrorism and organized crime.

The scope of the *ECHELON* primarily targets nonmilitary entities such as governments, public and private organizations, companies, and individuals. Originally, the *ECHELON* computer network was only able to sort through intercepted satellite communications, and was only able to analyze phone call–related information, but not its content. In the last decades, however, the system has reportedly been updated and its surveillance capabilities broadened to tap into cable communications and monitor the Internet.

The term *ECHELON* comes from the computers that form the backbone of the surveillance system. Within each monitoring station, computers contain catalogues and lists of key words, telephone numbers, and e-mail addresses that reflect information that the intelligence agencies of the partner countries are seeking. Each station uses a particular *ECHELON* dictionary that contains target lists entered by its parent agency and partner organizations. When certain key words, addresses, or patterns appear in an intercept, they are automatically recognized by the computer system, and are sent to the intelligence agency that originated the request. The system is particularly useful because it separates intercepts of interest from those not of interest. A majority of intercepts are thus filtered out and not retained within any database.

Controversies

ECHELON, as with any other surveillance system, raises important questions about the trade-off between national security and liberal democracy. Most media reports on *ECHELON* have emphasized potential abuses of power. In 1988, Margaret Newsham revealed that when she was working as a software engineer at a ground station based in Menwith Hill, UK, in the late 1970s, she heard phone calls from Senator Strom Thurmond (R-SC). In addition, Margaret Thatcher supposedly used *ECHELON* to spy on her ministers. In 1992, senior intelligence officials working for GCHQ, the British SIGINT organization, revealed in the (London) *Observer* that nongovernmental organizations such as Amnesty International, Greenpeace, and Christian Aid had been intercepted by the system because they referred to arms trafficking.

Negative media reports have reinforced the tendency among the general public to consider the government's eavesdropping networks as all-powerful. These stories have also raised important questions about the impact of surveillance on democracy. International intelligence cooperation in the area of SIGINT has allowed partner countries to circumvent prohibition on domestic spying. This is done by means of a mechanism whereby each partner can ask other partner-states to carry out intelligence collection on its citizens on its behalf. Fears that *ECHELON* or other similar surveillance systems have been used as a tool for domestic control are widespread. Allegations

about the use of the ECHELON system for political and economic espionage, and public knowledge of the existence of NSA-run stations throughout Europe, led the European Parliament to establish a Temporary Committee on the ECHELON Interception System (1999–2004). This did not lead to any major revelation, but confirmed the existence of the ECHELON system.

The controversies generated by the ECHELON network are not without historical precedent. The investigations carried out by the U.S. Senate Select Committee to Study Governmental Operations With Respect to Intelligence Activities (the Church Committee) in 1975 shed light on a series of abuses of human rights and civil liberties committed by the U.S. intelligence community in the early Cold War. In a project codenamed SHAM-ROCK, the NSA was able to intercept international telegrams entering into and exiting from the United States, using the facilities of three major telegraph companies. This surveillance program may well have been in contradiction of the First and Fourth Amendments to the Constitution, which respectively protect political freedoms and guard against unreasonable searches and seizures. The revelations of the 1970s paved the way for the institutionalization of the congressional oversight of intelligence in the United States.

The Foreign Intelligence Act of 1978 put in place a process of judicial review that required U.S. government agencies to obtain a warrant from a special court in order to collect “foreign intelligence information” between “foreign powers” and “agents of foreign powers” (the latter category potentially includes U.S. citizens). Further procedures were instituted in subsequent years to limit the acquisition and retention, or prohibit the dissemination, of certain types of intercepts made by U.S. intelligence agencies, in order to safeguard the rights and privacy of U.S. citizens. U.S. government agencies now operate under a set of legal requirements when they intercept communications involving U.S. citizens. This also applies to the ECHELON system.

However, the existence of a formal system of intelligence accountability does not ensure that civil liberties are systematically respected, or that controversies will not emerge. For instance, in 2005, a controversy arose following media allegations that, in the aftermath of the 9/11 attacks, the

administration of George W. Bush had allowed the NSA to carry out a warrantless wiretap program which involved intercepting the communications of U.S. citizens.

The growing importance of social media in the early 21st century further stimulates long-standing debates about the trade-off between national security and liberal democracy. Social media have become an essential source of information for intelligence agencies seeking to find information on potential terrorist organizations or to predict political trends abroad. For example, experts have suggested that a better understanding of social media could have helped the Central Intelligence Agency (CIA) to forecast the Arab Spring of 2011.

The vast amount of information available within social media platforms poses significant challenges to intelligence agencies, which typically need to process information and distinguish the “wheat from the chaff,” relevant information from noise. Social media publicize vast amounts of essentially private information. This phenomenon redefines the boundaries between public and private spheres. This societal evolution and the efforts of intelligence agencies to cope with it should prompt continuous scrutiny from intelligence overseers and activists.

Echo Chamber Phenomenon

The concept of the “echo chamber phenomenon” emerged as a result of the rise of opinionated and partisan media. In relation to political media, the echo chamber phenomenon most commonly refers to the flow of information on the Web and the information-seeking behaviors of Internet users. The vast number of partisan Web sites and the proliferation of partisan voices on social network sites create cavernous echo chambers as people reiterate what others have already said, an idea that is reminiscent of Gaye Tuchman’s notions of the “web of facticity” and the “news net,” but practiced with political intention, rather than as an unintentional by-product of modern journalistic practice. The metaphor of the echo chamber, which alludes to the idea of a bounded enclosed communicative space that can potentially magnify messages and insulate them from rebuttal, has been employed in varying ways to explain relationships between the media and audiences.

The echo chamber phenomenon has been used to explain the production and dissemination of information published among news media outlets. In an era when online journalist outlets are expected to publish content 24 hours a day, seven days a week, information is consequentially recycled and reused as the same stories and opinions tend to appear in multiple outlets at once. Large and established media companies, as well as smaller, alternative media outlets and Web logs, reference each other to support their material. In echoing each other’s news and opinions, each outlet legitimizes the other.

This premise was illustrated in a study of conservative media outlets and their audiences conducted by Kathleen Hill Jamieson and Joseph N. Cappella in 2008. They argued that three outlets in particular—Rush Limbaugh’s radio talk show, Fox News, and the editorial page of the *Wall Street Journal*—constitute an echo chamber that effectively promotes and defends conservative principles and the Republican Party. Not only do these three distinct media entities quote each other in their reporting, they also create positive feedback loops for audiences by featuring links to each other’s content on

their Web sites. Jamieson and Cappella conclude that the consistency and repetition of their conservative message creates an ideological comfort space for conservative audiences because the media’s opinions resonate with their existing beliefs.

Social Media

The above example describes the audience as a passive consumer of information in a media-dominated echo chamber. However, audiences can also assume a more active role when they participate in content creation on interactive digital venues. Using social network sites, personal Web logs, and other Web platforms that encourage audience interaction, individuals strengthen the echo chambers by reposting media content and offering supporting opinions.

In particular, scholars and critics have acknowledged the capacity for social network sites to amplify echoing effects as a result of their technical structure and design. On social network sites, users seek out and maintain connections with others with whom they share similar beliefs. Friends and connections overlap in most networks, and consequentially, users end up hearing the same information over and over. Research has suggested that people who are repeatedly exposed to the same information delivered by diverse sources eventually accept the information as truth.

To exemplify this point, it is helpful to consider the blogosphere during the 2004 election, which successfully convinced the mass media that presidential candidate Howard Dean had more traction in the campaign than he actually did. The echoing of support that reverberated throughout the realm of digital Web logs suggested that Dean had engendered a significant number of supporters, stimulating the media to report on his popularity among the electorate. However, it was eventually recognized that the digital endorsement for Dean represented in the blogosphere did not translate to offline support, and therefore the online echo chambers had created a false depiction of reality. More recent uses of social network sites by activists and special interest groups have successfully created a similar distortion of the truth, as the repetition of slogans and stories that travel through online social networks create the impression that a given message has gained more visibility and public acceptance than it actually has.

Audience Fragmentation and Polarization

Creating a false illusion of reality is just one negative implication yielded by the echo chamber phenomenon. Audience fragmentation and polarization are additional problems that have been recognized when the echo chambers are fueled by media and audience participation. Communication and social science research suggest that audiences enter the political arena with existing attitudes and preferences that they wish to reinforce through their selection of compatible media. Internet technology empowers users to selectively expose themselves to certain content and opinions that resonate with their pre-existing beliefs. Through this information-seeking process, audiences guard themselves from information that challenges their beliefs, and ultimately their involvement in partisan echo chambers leads individuals to adopt more extreme attitudes that increase the polarization of political attitudes.

Some have suggested that the echo chamber phenomenon and its polarizing effects continue to intensify as a result of the advancement of technical and cultural characteristics of the Internet. For example, news organizations and political campaigns are increasingly encouraging their online audiences to formulate social groups and discussion forums surrounding topics of shared interest. Researchers have claimed that this activity produces social enclaves of like-minded people, which ultimately prevent citizens from gaining exposure to diverse viewpoints and sharing of common experiences. Online social groups insulate themselves and their opinions from challenges, which results in a widening of gulfs between extreme sides on public issues.

Conclusion

Despite the widely discussed negative implications of the echo chamber phenomenon, some have suggested that the repetition of information created by the echo chamber effect may allow audiences to become more informed on political issues. The echo chamber phenomenon represents an important theory that has significant implications for political communication, especially when conducted in a digital environment.

Economic and Social Justice

Combining elements of several key views of social justice it is possible to generate a definition of social justice. Social justice is a state of affairs in which (1) benefits and burdens are dispersed through a society based upon some principle(s); (2) political leaders and other integral decision makers protect the basic rights, liberties, and entitlements of individuals and groups by utilizing procedures, norms, and rules; and (3) authorities and other actors, including citizens, treat all humans beings with dignity and respect. These three aspects of social justice are closely aligned with distributive, procedural, and interactional justice.

Rise of Social Media

Access to information is critical for the functioning of a healthy democracy. As a result, the role of the printing press during the rise of American democracy was critically important. It was through the printing press that new ideas emerged and conversations could take place that refined and developed these ideas. In fact, during George Washington's administration the Federalists, under the leadership of Alexander Hamilton, created the *Gazette of the United States*, causing

Republicans, led by Thomas Jefferson, to publish the *National Gazette*. These newspapers allowed competing political views to further the interests and goals of the political parties. Access to information flourished during the 1840s after the invention of the telegraph. News could immediately be sent from city to city. In the 1920s radio became available, and in the late 1940s television revolutionized the way many Americans received information. Moreover, the advent of television allowed politicians to speak directly to the American citizenry.

The rise of modern social media presents a new and exciting chapter for American democracy. The Internet has connected people like never before. Recent research from the Pew Research Center found that more people receive news from online sources than through radio or newspapers and, while television remains the most popular outlet, its audience consists mostly of older Americans. By mid-2012 over 2.4 billion people were using the Internet. In addition, by the end of 2012 there were 6.7 billion mobile subscriptions connecting people throughout the world.

Social media provides a means for individuals to become informed about events and a means to connect people who share common concerns and interests. Social media allows individuals to work and be champions for their own political views as well as to highlight issues important to them and work toward generating concern among other people as well. The 2008 U.S. presidential election saw a significant increase in the use of social media to connect with potential voters. Senator Barack Obama's campaign in 2008 was much more successful using social media than Senator John McCain's campaign. The role of social media in the 2012 election was even greater. In fact, the second debate of the 2012 U.S. presidential election generated 12.24 million comments on Twitter and Facebook, making it the top political event of all time in terms of such comments. Social media provides individuals with the opportunity to share their thoughts, critiques, and agreements with political leaders. In addition, social media also presents a means for inequalities and inequities to become known. That is, social media provides a way to remove the invisible barrier that keeps injustices from being widely known and recognized. Eliminating this invisible barrier can

help increase the recognition of these events and generate a desire to ameliorate these injustices.

Distributive Justice

At its core, distributive justice focuses on considerations of equity. Specifically, the point of concern is on how to allocate scarce resources fairly and appropriately. A frequent issue, however, is that decision makers typically disagree about what factors should be utilized to determine proportional outcomes. Liberals and progressives, at least in Western society, were quick to pick up the cause of social justice. Two traditions emerged: one focusing on utility and the other on the basis of basic individual rights. "The greatest happiness of the greatest number" reflects the foundations of the utility approach. Essentially, then, a just approach is one that satisfies the majority of individuals. The focus of utilitarianism is on the consequence of a decision. The basis of the welfare state depends on the utility approach. That is, redistributing valuable resources to assist those who need the assistance the most serves the common good. However, there is certainly disagreement about whether this approach is just. For instance, in a leaked recording from a private fund-raising event, 2012 Republican presidential candidate Mitt Romney was recorded as saying that 47 percent of Americans are "dependent on government." In effect, he was making the claim at a closed-door event that 47 percent of the country is unjustly using and relying on money from wealthier Americans.

Basic individual rights refer to a common conception of universal principles that apply to everyone. This approach is often referred to as deontological. Ultimately, the focus of deontological approaches is not just on the consequences of human action, but on other considerations as well, and requires a willingness of all people and institutions to abide by these principles. John Rawls famously claimed the more just system is the one that would be selected by decision makers under a "veil of ignorance." That is, without having any knowledge about one's own status or position in society, the system that one would select without an awareness of his or her own position would be the most just system. Interestingly, a voluminous amount of empirical research has shown that making decisions

without considering individual life experiences, personal characteristics, and opinions is clearly impossible. The practicality of this approach to justice has been called into question.

The concept of justice is often called into question by political conservatives who view the current social systems as perhaps not perfect, but certainly necessary. Recent research has found political conservatism to be related to two principles: traditionalism, or being resistant to change, and the justification of inequality or hierarchy. Not surprisingly, justice concerns that often involve challenges to the status quo are concerning to conservatives. Political conservatives do not disregard issues of justice, but they often prioritize other issues such as merit and personal freedom.

Procedural Justice

Concerns for justice often entail more than a concern about the allocation of resources. Procedural justice, for instance, focuses on the procedures or methods used in the decision-making process. Research has found that the perceived fairness of the procedures used in the decision-making process influence not just the perception of the final outcome, but also the individual's view of the decision maker. Early procedural justice theorists suggested two processes are used in perceptions of procedural fairness: process control and decision control. Process control refers to whether people have the opportunity to present evidence on their own behalf prior to a decision being made. The impact of being able to present evidence on one's behalf has generated a great deal of research labeled the "voice effect." Having a voice in the process drastically increases perceptions of procedural fairness. Moreover, having a voice increases positive affect, decreases negative affect, and is associated with greater trust in decision makers. Decision control refers to whether individuals have a voice in the decision process itself. When individuals feel they have a voice in the process and will have some influence in the decision-making process, people perceive procedures to be fair and just. In contrast, when people are excluded from presenting evidence on their behalf and lack a voice in the decision-making process, perceptions of procedural fairness are negatively impacted.

Why do people care about the procedures used in the decision-making process? One idea is that it ensures people have received a fair outcome. In addition, the fairness of the decision-making procedures communicates that people are valued, respected, and understood. That is, allowing people a voice in the process makes them feel appreciated as individuals and increases perceptions that other group members value their input and perspective. Perceptions of fairness are associated with social comparison processes. As a result, procedural fairness alleviates concerns about one's standing compared to relevant others. Social comparisons lead to perceptions of injustice when an individual has not had a role in decision-making processes.

Interactional Justice

It has been proposed that perceptions of justice can be affected not only by how people are treated by authority figures, but also how citizens treat one another. That is, individual experiences of discrimination or the harboring of prejudiced attitudes can create unjust environments leading to feelings of unfair interpersonal treatment. Four aspects of an interaction impact interpersonal justice: respect, truthfulness, justification, and propriety. Being treated with respect and engaging in honest, truthful interactions increase perceptions of justice. Justification refers to receiving quick and satisfactory explanations for decisions. Finally, propriety refers to the avoidance of prejudicial treatment. People desire justice not only in the allocation of resources and in decision-making procedures but also in everyday interactions with others. This is an often overlooked but important aspect of justice.

Social Media and Justice in Action

The *Arab Spring* is a term that has been used to describe the protests, demonstrations, and revolutionary actions that occurred in parts of the Middle East and northern Africa starting in 2010. While the role of social media in the revolutions has been discussed at length, there seem to be two important factors during the Arab Spring that were strongly impacted by social media. One, social media allowed information to spread and knowledge about government abuses to become widely known. Two, social media allowed individuals to

Young speakers at a rally for the creation of antibullying legislation in the state of Michigan at the Michigan Capitol in Lansing on October 8, 2011. Social media campaigns have been instrumental in bringing attention to social issues such as bullying.

connect with one another and organize protests and demonstrations. These networks connecting and working through social media became difficult to contain.

During the Egyptian uprising, activists provided near real-time updates about protests and demonstrations. The instant access to information helped create an atmosphere of revolution as a result. The impact of social media during these revolutions was critical. Moreover, the role of social media as a means for unifying people together in other political movements and protests will surely prove a fruitful avenue for future research. For instance, Twitter has become a commonly used means for dissent and criticism among citizens in Saudi Arabia. In a country that did not experience issues during the Arab Spring, many citizens have used social media to connect and, perhaps for the first time, criticize the Saudi government.

In the United States, the Occupy Wall Street movement, a movement aimed at confronting the greed and corruption of the top 1 percent in America, began with a Twitter message by the magazine *Adbusters* suggesting a march in the Lower Manhattan area. The message was spread through various social media outlets (Twitter, Facebook, YouTube, and more) and participants used these outlets to provide real-time updates. When protesters began to have confrontations with law enforcement officials, many of these altercations were recorded and uploaded to social media outlets. The use of social media connects individuals from across the nation and allows local groups from different cities to stage united demonstrations and protests.

In the United Kingdom (UK), social media has presented a forum to address the growing concern about bullying. In November 2012, during National Anti-Bullying Week in the UK, Facebook created an anti-bullying page as part of the Family Safety Center. The emphasis of the page was placed on conflict resolution and creating stronger social networks to prevent and address bullying.

With parents feeling many school districts lack the ability to adequately address bullying, social media provides a means to address the issue without the assistance of school districts. In March 2013 a father used Facebook to express his frustration with bullying behavior at his son's school. In the Facebook post that father held a sign saying "I stand behind my son in the fight against bullying!" Within a week the post had received 453,000 "likes" and 466,000 shares.

Social media presents an exciting medium for connecting concerned citizens, mobilizing the disenfranchised, and bringing greater attention to economic and social justice violations both domestically and around the world. Social media allows individuals access to information about issues of inequality, as well as ways to take action to help ameliorate these issues.

E-Democracy

Over the past two decades, innovations in digital information technologies have contributed to the emergence of electronic government, or e-government, designed to communicate information, deliver services, and offer additional avenues to interact with and participate in government across industrialized countries. Strikingly, this new technology has revolutionized and empowered human interaction through a new, unmediated many-to-many communication on a large scale through new forms outside the antiquated boundaries of television, radio, and newspapers. These new forms, that is, e-mail, database software, and especially the Internet, have had, and will continue to

have, significant influence on the functioning and health of democratic political institutions and their relationship with the citizenry through enhanced opportunity to participate.

An expanding body of research focuses on the Internet and democratic governance relationship. Not surprisingly, opinions about the Internet's effects on democracy are mixed and range from those that foresee revolutionary changes and a strengthening of democracy to those that envisage no changes regarding the distribution of power in society or a weakening of democracy. With e-democracy defined as the ability of citizens to electronically access governmental information and services, interact with governmental officials, and participate in governmental decision processes and elections, this entry focuses on the context, practice, and assessment of e-democracy.

Context

The scope of e-government emphasizes the dissemination of information, delivery of services, and provision of avenues for citizens to participate in government decisions via the Internet. These Internet features build the foundation for the implementation of e-democracy, and in doing so, government Web sites are more than cyberspace highways flanked by information-driven billboards and a series of service stops along the way. Based on the dissemination of government-related information to provide both transparency to citizens about political issues and check on the government's power, such sites offer interactive online tools to enhance public space with dialogue between citizens and their governments, such as with the United Kingdom's MySociety and the Sunlight Foundation in the United States. Another example is Meetup, which enables common-interest groups to set a time and place to organize locally, practicing their rights of assembly and speech. Jared Duval finds that there are 6 million Meetup members and 2,000 meet ups daily worldwide, while the SeeClickFix application facilitates citizens to report potholes, fallen trees, and so on. As these Internet innovations spread, they, according to S. Rho, facilitate an informed citizenry, specifically addressing direct democracy through openness and active participation. E-democracy is providing creative solutions for transparency and accountability in government.

Practice

John Stuart Mill wrote that local governments are “schools of democracy,” thereby affording greater potential for citizen–government interactions and participatory opportunities than other levels of government. Current research by T. Wohlers and others reveals that local government Web sites across industrialized countries are mostly limited to providing a range of basic one-way services rather than transactional services. Similarly, M. Bräuer and T. Biewendt’s study of Germany’s 80 largest cities suggests that they provide a variety of virtual ways to directly interact with city officials. However, J. K. Scott and others find that, while some cities have made great advances, only a few facilitate meaningful, interactive forms of participation. For example, L. S. Clift finds that St. Paul, Minnesota, offers an e-mail notification and personalization option, while the Village of Hastings, New York, provides an online input system. Across the Atlantic, German cities like Esslingen and Ulm use the Internet as a tool to elect the Municipal Youth Council and evaluate public projects.

It has also been argued that, while the successful facilitation of interactive online public dialogue and consultation with government remains rare, new digital information technology applications, such as Web 2.0, have the potential to enhance both direct and representative democracy. However, several obstacles remain regarding the implementation and growth of local e-democracy. They include the lack of information technology expertise to reduce errors and system tampering, lack of city administrator motivation to implement Internet-enhanced participatory structures, limited access for the poor within the context of the digital divide, and uneven telecommunication infrastructure availability nationwide. Moreover, the prevailing ideology among citizens and policy makers, socioeconomic conditions, and the policy entrepreneur presence either inhibit or facilitate policy innovation.

Assessment

Opinions about the merits of e-democracy are mixed. Optimists, such as Clift, argue that the Internet can be used to enhance direct democracy with more community interaction with their respective governments. Others, like J. Johnson,

perceive the implementation of e-democracy as running counter to a liberal democracy. Similar to the argument about a decline in social connectedness through technology, critics claim that the impersonal dialogue encouraged by e-government undermines the participatory nature of a democratic political system. Nevertheless, research points to promising advances made by local governments in e-democracy.

EdgeRank

EdgeRank is the name given to a suite of algorithms that optimize the news feed feature on the Facebook social networking service. EdgeRank determines which news items to display and in what order, thereby influencing the visibility and reach of user activity on the service. It structures a user's capacity to disseminate information, his or her exposure to the activities of others, as well as the capacity of groups to use Facebook for political and commercial purposes. While the particular details concerning EdgeRank's operations remain confidential, its basic functionality was first publicly outlined during Facebook's third semiannual F8 conference in April 2010.

Consistent with the algorithm's origins in graph theory (an area of discrete mathematics), in Facebook's terminology, an edge represents a relation or link between two relevant data points: one user's activity compared with another's news feed. Every time a user logs into Facebook, EdgeRank derives a set of relevant edges (relations among friends, fan pages, groups, and so on), which may include the posting of new Facebook objects (a change in status, a new photograph, video, or hyperlink), or recent interactions with already existing Facebook objects (the ongoing accumulation of "likes" or comments). To differentiate and prioritize the sheer number of these daily interactions into a useful news feed, EdgeRank scores each edge according to three formal properties: affinity score, weight, and time decay.

Affinity score assigns a value to the social relations between the user initiating the event (the edge creator) and those users who may view the event on their news feeds. The more Users B and C interact with content contributed by User A, for example, the higher the affinity score of edges originating from User A will be. Affinity is a one-way relation: it only considers the activities of news feed owners (e.g., Users B and C) and not those of the original edge creator. Taking this approach reduces the potential for link spammers to game the algorithm because the fact that other users engages with an individual's content does not necessarily mean that the individual is close to them.

Weight assigns a value to the kinds of activities a user undertakes on a scale that reflects the depth of engagement represented by certain activities:

clicking, liking, following, reading, listening, and viewing. While Facebook continues to adjust EdgeRank's parameters, certain activities have been consistently assigned more weight than others. In terms of content creation, posting an image has more weight than expressing a change of status. In terms of content consumption, commenting on content has more weight than merely viewing it. Calculating weight also takes into account the path that led to a user's interaction. Clicking through an ad is differentiated from clicking through a fan page, for example; this approach reflects Facebook's overarching commercial strategies and goals.

Time decay assigns a value to edges based on the time of their origin and the recency of engagement with them. It is calculated dynamically to prioritize both newer edges and edges that have drawn recent engagement. In this way, older edges may still retain a high value if they continue to garner user interaction.

When deriving an overall score, EdgeRank also takes into account whether the edge was produced by a member of some prioritized group. People in a user's basic close friends list feature, or those organized into custom smart lists built according to a user's preference, produce higher scores: Family ties, work relations, and geographic location are common organizing criteria here. In general, EdgeRank seems to be motivated by Facebook's commitment to populate a significant percentage of the news feed with organic (e.g., nonsponsored) content, as well as its desire to experiment with and integrate new forms of relationality as prioritization heuristics. With the introduction of the GraphRank algorithm as a subset of EdgeRank in 2011, shared interest around cultural objects (such as books and films) became a key example of such heuristics.

While the precise ratio of the elements used by EdgeRank to calculate an edge's score is unknown, the algorithm tends to prioritize edges that either reflect a higher degree of engagement by other users or those that entice users to be more engaged themselves. In other words, EdgeRank is ultimately designed to draw users into becoming more active and for longer periods of time. Using prior activity around edges as a feedback mechanism for structuring present relevance has clear implications for groups large and small: Everyday

users, professional associations, and civil society organizations all use Facebook to promote their events, causes, services, brands, and products. Because visibility on the service is determined by the volume and depth of activity, EdgeRank motivates groups to contribute content that entices engagement so as to increase the likelihood that their content will persist and circulate on other users' news feeds.

freedom of speech, digital citizenship, resources, and security remain ones that often divide parents, teachers, administrators, and students in terms of policy and practice. However, it is no longer a matter of whether or not social media becomes integrated into curricula and instruction; social media are everywhere and will not be going away. Schools continue to grapple with safeguards and limits, while teachers and students are forging creative and rich spaces to build community and expand learning, despite the potential problems.

Teachers and administrators have become more comfortable with the use of social media in classrooms. They have recognized that three aspects of social media are becoming the norm: the immediacy of information, formation of links and bonds with individuals one may never meet in real life, and opportunities for collaboration and participation. Concerns regarding social media use in education have also grown, as has the backlash by administration and others. Four negative ramifications have generally been cited as reasons for prohibiting the use of social media in schools: inappropriate relationships between teachers and students; peer-to-peer harassment or cyberbullying, in which a victim receives numerous negative personal comments and continual derisive and insulting communication; risk of connections with sexual predators posing behind false identities; and student participation in illegal activities, including pirating music and movies. Legislation at federal and state levels, as well as acceptable use policy (AUP) adoption by individual schools help safeguard minors and protect the institutions yet allow for cautious and careful communication and learning activities.

Education, Issues in

The intersection of social media and education began with trepidation. Kindergarten through 12th-grade (K–12) schools and institutions of higher education were among the last organizations to embrace this technology because of factors such as lack of access and training as well as fear of consequences of misuse. Within the last five years, public and private schools at all levels have recognized the need to develop and maintain a presence on sites such as Facebook, Twitter, Tumblr, Wikispaces, and YouTube. Issues such as

Access and Limitations

Schools vary tremendously in technology, both in availability and use. Resource-rich districts are often replete with digital devices as well as teachers who know how to use them. Schools in geographic areas of lesser socioeconomic levels generally have less equipment, often older or with less capability, and may not have the luxury of professional development for faculty. This so-called digital divide is a concern because skills and knowledge associated with technology are becoming requirements for active involvement in the 21st century as an individual and as an employee.

Schoolchildren playing an educational game together on a mobile phone. Although social media and technology foster important skills, the ubiquity of smartphones has made monitoring Internet access and online activity much more difficult for educators.

K–12 school settings often provide students with information and expertise that help them advance and which they would not gain outside of the classroom. Education has been a way for many individuals to rise above their current social and economic background. Without access to tools and activities that are quickly becoming commonplace in society and business, some students will remain at a disadvantage and may not be able to maintain or improve their lives.

With the growth of Web 2.0, applications that allow users to easily post content, images, and videos and remix the same to create new material have changed the way many schools approach information and communications technology (ICT). Henry Jenkins and others describe the new participatory culture that exists and outline new and different skills necessary for full membership in society. Competencies necessary for college, career, and citizenship in the 21st century have been described as the 4Cs: communication, collaboration, critical thinking, and creativity. Social media fosters all four, and students often become

more skilled with these outside of school than in class. Smartphones have also dramatically changed the situation. Schools are no longer able to control access to the Internet as many individual students and faculty have the ability to connect within their pockets at all times. The result has been a combination of safeguards and blocks, policies that govern responsible use, and access and teaching that assist students in learning 21st-century skills related to ICT. Personal as well as professional ICT use by students and faculty, even outside of school, has become part of school policies.

Limitations of access to social media sites, especially Facebook and YouTube, have become a common way for schools to safeguard their students. Many parents express concern that, with too much freedom, students may knowingly or inadvertently access material via social media that is offensive or contains content that violates their family standards of morality, religion, and decency. This type of community dialogue and consensus on acceptable limits is commonplace with regard to curricula and texts. However, the openness and accessibility of social media presents numerous potential problem situations. Schools have been cautious with student, and even teacher, access of social media during school hours and on school equipment. Firewalls and other security measures help control this to some degree, but these measures are criticized as limiting legitimate educational uses of these sites.

Two federal laws govern ICT use in schools. The Children's Internet Protection Act was passed in 2000 and requires schools to filter or block obscene visual depictions and material harmful to minors during computer use by minors. The law was passed prior to Web 2.0 applications and does not specifically address social media. The Broadband Data Improvement Act, passed in 2008, includes a section called Protecting Children in the 21st Century. Schools are required to have an Internet safety policy that teaches minors about appropriate online behavior, including interaction social networking Web sites and cyberbullying awareness and response. Schools have learned to balance restriction with education for responsible use.

Promotion Versus Privacy

Many schools' first reaction to social media was avoidance. As social media use became the norm,

educational institutions realized that blogs, Facebook, Twitter, and other social media sites provide a valuable mechanism for reaching stakeholders and maintaining continuous, real-time communication with the public as well as faculty, staff, and students. Schools also need to ensure that they are controlling their own public images and are able to ensure that accurate and positive information is available to all. In an era of accountability and standards, as well as competition and choice, social media can assist educational institutions in creating and maintaining unique identities, similar to brands in business.

In higher education, social media have become the number one way to reach prospective and current students and alumni. A majority of high school students are using social media as tools in their college selection processes. Colleges form social network groups for newly accepted students so that they can immediately feel connected to the institution and others. While schools may have official Web sites that provide public personae, there are also sites that allow current and past students to voice their opinions regarding all aspects of academic and campus life. The anonymity allowed by the Internet creates problems because individuals can post any negative comments without identification or supporting evidence. Schools have countered this by creating their own Facebook pages and Twitter feeds that balance the picture and respond to concerns immediately.

Promotion in school districts has become a necessary component in daily operations. School choice in some areas allows parents to compare schools and select one for their child. Charter and private schools provide alternatives to local schools. K–12 schools are vying for students in some cases much like colleges. Districts are turning to social media to demonstrate their use of innovative technology as well as to spread the word of their accomplishments. They recognize that the opportunity for positive connections with their communities outweighs the potential problems. One problem is time. Maintaining a presence in social media outlets requires at least one individual with dedicated time for creating, revising, and repurposing content as well as monitoring these sites and responding to unplanned comments or situations. Using tags to connect with other districts on similar issues has also become

critical. Some districts that are not used to either publicity-minded activities or social media do not utilize these sites, and may see little benefit, get discouraged, and quit. Clear objectives and constant monitoring of statistics such as views, “likes,” and comments are necessary, accompanied by strategic responses. Social media may feel inappropriate for some educators, yet many schools recognize that lessons from business and entertainment can have benefits for organizations that traditionally kept low profiles.

Privacy issues have grown to include the personal presence of individuals connected with the organization. Although teachers and administrators have the right to use social media for themselves outside of school, the impact of that use on their jobs can be a concern. Teachers have been fired, fined, or suspended for comments, activities, or photographs posted on personal Facebook or Twitter accounts. Individuals have also received sanctions for unprofessional comments that were job-related, such as complaints or pejorative terms used to describe students, colleagues, or parents. While some have argued that teachers and school personnel have the same freedom of speech as any citizen, others acknowledge that, by virtue of their responsibility as role models to young people, they are held to higher standards of appropriate actions and words. Online activities that are designed to hurt, defame, or harass others are part of cyberbullying or cyberstalking. Cases have been documented that establish how this type of activity can push some individuals to retaliate or seek escape through destructive behavior, even suicide. Two types of cyberbullying can involve direct messages, or use of proxy (someone else, or posing as someone else) to send negative comments or altered images.

Blurring Roles

Teachers and professors who have embraced social media for learning often find that students seek continual communication. The term *friend* has become a verb used to describe linkage on Facebook and other social media sites. The question of whether or not to friend students is a difficult one for some teachers. Teachers who would never consider students as friends in the traditional sense are grappling with benefits versus potential problems of connecting on social

media sites. This is especially true in higher education, where students are generally over 18 and more independent.

One of the most difficult aspects of social media use by educators and students is perception. Unlike face-to-face communication, words stand alone without voice inflections and facial expressions to mediate the message. Communications are swift, public, able to be forwarded beyond the intended receiver, and open to interpretation by others. The question of which identity, personal or professional, is used when posting becomes blurred.

Educators have become entangled in situations that have damaged their reputations through unintended consequences of actions. When something is shared on social media, it has the potential to become public in many other arenas. Individuals have been duped in many ways: Students have posed as adults on dating sites, downloaded questionable photos from teachers' posted vacation albums, or caught teachers' negative comments about colleagues or workplaces. In some cases, teachers have fallen into inappropriate sexual or personal relationships with students that may never have happened in real life but result from the ease of sharing personal feelings through social media. Schools are now taking precautions to decrease potential problem situations by establishing guidelines for personal as well as professional use of social media by teachers. As many of these consequences and incidents are reported, teachers are becoming more cautious and recognize that anything posted is really public, despite settings and attempts to keep it private.

Digital Citizenship

The Internet has broken through traditional classroom walls and allowed students and teachers to expand their learning globally. Connections with others in countries around the world, authentic learning, and virtual field trips to otherwise out-of-reach locations are some of the ways that social media has provided learning that would have been impossible before. Students are taught to follow rules for behavior at home, in classrooms, in business, and in various other social situations. They learn to vary speech and behavior in different situations. However, rules and norms for online social interaction are being forged and revised within the digital landscape. Teachers now must

educate students in what it means to be a good citizen in the online world.

Four areas have become critical to social media in education. One is digital etiquette, or netiquette. This refers to electronic standards of conduct. Teachers are used to teaching students what is appropriate for courtesy and civility in school and holding them accountable for unsuitable behavior or speech. The same instruction must occur for online interaction via social media. Despite the freedom allowed in online environments, students should be taught and expected to follow the same standards for behavior and speech that they would in person. The second area, digital rights and responsibilities, extends this beyond mere courtesy. It refers to freedoms extended to everyone in a digital world. Just as teachers explain that rights such as freedom of speech come with responsibilities, students must be instructed that freedom to post comments and thoughts online is not a license for profanity, harsh comments, or hate speech. This is particularly true of many polarizing issues that educators currently face. Teachers and students must learn together how to disagree and debate in a manner that is reasonable, even forceful, and yet civil.

The first two areas of digital citizenship rely on personal responsibility for one's own behavior. Two other areas that are somewhat more grounded in society are legal aspects and security. New laws are helping to shape when online behavior is not merely discourteous but illegal. For example, individuals can form accounts with false names or the name of a real person and post comments that are harmful and damage someone's reputation. Inappropriate comments and behaviors on social media sites have been cited as partially responsible for serious results, damages, and even teen suicides. Courts are defining where and how individuals are culpable for online comments and behavior. The fourth area of digital citizenship that is related to social media is digital security. This refers to electronic precautions to guarantee safety and self-protection. Students are often victims of online scams and may provide personal information that can lead to identity theft. Native applications, or apps, may contain code that monitors and obtains digital information that can then be sent or sold to third parties. Staying logged in can also give unwanted access. These safety

features are different from security measures such as firewalls utilized by schools at the institution level. Teachers must educate students regarding the many cautions related to digital security that are especially important with social media.

Digital citizenship is not mandated in most curricula. However, it is as crucial as mathematics and literacy in the global world. Schools, parents, and teachers need to examine ways that knowledge and skills related to social media and online behavior can become the subject of instruction at all levels.

Conclusion

Schools need to find ways to continually respond to issues associated with social media in schools. In general, placing limitations on students tends to make something even more appealing; some students will always find ways to circumnavigate the restrictions. Most schools have accepted these new spaces as a constant in students' lives and ones that are difficult to impossible to control. They cautiously monitor new ICT tools in order to remain current and make careful selections and decisions that will provide quality education for students. Many educators have elected to teach students about the potential dangers and problems and provide them with skills to make good choices for their words and actions.

Social media use has become commonplace in classrooms, schools, and universities with the ubiquitous nature of smartphones and tablets. Schools and educators must find their individual comfort levels with devices and spaces so that they are conscientiously safeguarding those in their care as well as embracing innovations that challenge, engage, teach, and connect.

Egypt

On January 17, 2011, an Egyptian man set himself on fire outside of Egypt's parliament building to protest the government's refusal to allow him access to inexpensive, subsidized bread for his restaurant. A mobile phone was used to record and distribute, via the Internet, a closed-circuit television image of the incident. This self-immolation, and at least two others the following day, sparked an 18-day uprising fueled by social media that would end the three-decade dictatorship of Hosni Mubarak. The protest that began as a small youth movement drew ideas and strength from the successful uprising in Tunisia in December 2010, which brought down that country's authoritarian president, Zine al-Abidine Ben Ali.

Following the Tunisian revolution, Egyptian activists began to organize an uprising of their own to protest Egypt's high poverty and unemployment rates, government and police corruption, and the almost constant state of emergency that allowed Mubarak to censor the media, stop protests, and try civilians in military courts. Activists, especially Wael Ghonim, the 30-year-old head of Middle Eastern marketing for Google, and Asma Mahfouz, a 26-year-old female activist, utilized social media to help organize a Day of Rage on January 25, 2011. January 25th was selected because it was a national holiday designed to honor Egyptian police. In addition, this national holiday had been used in the past by activists as a day for protest marches.

In both the Tunisian and Egyptian uprisings, protesters used social media not only to organize

their activities but also to globally distribute information about their causes through a process referred to as cyberactivism. Ironically, it was the Egyptian government's own efforts, beginning in 1999, to expand the availability and use of information technology that would create the cybernetworks used by the protesters. Mostly young, educated Egyptians formed the core of the January uprising. Activism began with blogs, but quickly grew to include social media outlets, such as Facebook, YouTube, and Twitter, that allowed for widespread and immediate interconnectivity of the protesters.

In the days leading up to the beginning of the Egyptian protests on January 25th, Egyptian activists used the Internet to communicate with Tunisian protesters in order to learn how to prepare themselves for demonstrations and clashes with police as well as how to counter the effects of tear gas using cola and milk. Protest leaders also discussed the safety advantages of protesting at night, the use of black spray paint to obscure the windshields of police and military vehicles, and how to utilize traditional media to add outside pressure to the government. Egyptian activists posted videos from the Tunisian protests to study and use as examples.

In addition to the information learned from Tunisia, protest leaders received assistance from activists who had been forced to leave Egypt. Omar Afifi, a former Egyptian police officer who fled to the United States after his life was threatened because he wrote a book that discussed how to avoid police brutality, used YouTube, Facebook, and Twitter to advise Egyptian protesters how to avoid arrest, what they should wear, and how to engage in peaceful protest.

Activists and Social Media

Ghonim, working anonymously through a Facebook page created for Egyptian Nobel Peace Prize winner and opposition leader Mohamed ElBaradei, began to distribute revolutionary ideas to the page's followers. Facebook was seen as a crucial tool for cultivating support for a potential uprising because, whenever someone friended the page, it would show up on that person's Facebook wall as well. Such reposting allowed the messages to spread more quickly and to a much larger audience.

Posting under the pseudonym El Shaheed, or the Martyr, Ghonim's messages quickly spread to other pages, such as We Are All Khaled Said. The Said page was created during the summer of 2010 in reference to a man who was taken from an Internet café and beaten to death by police after he posted a video on the Internet showing police stealing drugs that they had just seized. Photos of his beaten body went viral, and a YouTube video about his death was seen by more than 500,000 people. The Facebook page itself had more than 470,000 friends at one point, which is significant, considering there were only approximately 21 million Facebook users throughout Arab countries in 2010. While the Said page originally began as a way to share information surrounding Khaled Said's case, it quickly became a space for broader political discussions about Mubarak's regime.

On January 14, the day that Tunisia's government fell, Ghonim invited his more than 350,000 Facebook followers to protest Egypt's government on January 25. In less than three days, more than 50,000 people replied yes to his invitation to join a Day of Rage. During the days leading up to January 25, Egyptian activists took to social media to discuss ideas such as how technology could be used to avoid surveillance and how to set up effective barricades. In order to move the protest from the virtual world to the real world, additional activists used Facebook, Twitter, and YouTube to call people to Tahrir Square and other sites around Egypt to begin the uprising.

Asma Mahfouz

The activist Asma Mahfouz already possessed experience in the use of social media for cyberactivism. Mahfouz was one of the founders of the April 6 Youth Movement that used Facebook in March 2008 to support a planned strike by textile workers in the city of Mahalla. While the April 6 protest was not successful, Mahfouz saw the power of social media in the Tunisian revolution. Using a Webcam, Mahfouz recorded a 15-minute video that helped to frame for Egypt and the world the reasons for the protest. In the video, posted January 18, she indicates that the protests are about basic human rights and that the men who set themselves on fire were not mentally ill as the government tried to portray.

An Egyptian activist and labor leader, Kamal el-Fayoumi, using Twitter to stay in touch with his followers in April 2009. Like Asma Mahfouz, el-Fayoumi had experience in organizing strikes in 2008 that were precursors to some of the events of the 2011 Egyptian revolution. Egyptian activists also received advice from Tunisian protest leaders in early 2011.

Mahfouz said that she would march in Tahrir Square on January 25, and she encouraged other women to join her. Mahfouz also took advantage of Egypt's patriarchal culture to encourage men to come out to Tahrir Square, if for no other reason than to protect the women. Such posts helped to diversify the ranks of the protesters from mainly young, well-educated members of the upper classes to doctors, lawyers, members of the media, Christians, and Muslims.

Mahfouz's video, originally posted on her Facebook page, quickly went viral. Under Mubarak's government, women faced high illiteracy rates, harsh divorce laws, and abuse by police. Women were not allowed to meet publicly to discuss reform under Mubarak's regime. However, the Internet provided women a safe space where they could gather and discuss controversial issues, thus continuing Egyptian women's long history of social activism.

Through social media, female cyberactivists coordinated how to prepare themselves for public protests. They encouraged each other to wear multiple layers of clothes, veils, and *abayas*, so if one layer was pulled off their bodies, they would not be exposed. In addition, women as well as men used social media, especially SOS tweets, to let others know when they were in danger, thus reducing the response time of aid givers. Such uses of social media by female activists dramatically increased the number of women participating in the uprising. At the beginning, women accounted for only 10 percent of protesters, but by the end, that number increased to 50 percent.

Media Framing and Control

Social media, as well as traditional media, was also used by protesters to frame the uprising in a way that was favorable. In an effort to sway Mubarak's foreign allies, cyberactivists flooded

the Internet with transparent content that served to counter the pro-Mubarak stories being presented by media outlets such as *Al Jazeera English*. Such transparency was especially important for American media, as the American government had been an ally of Mubarak and supporter of the Egyptian economy through billions of dollars of aid.

At one point, when the Egyptian Museum was vandalized and artifacts were destroyed by looters, media outlets began to describe Egypt as being in crisis and chaos. Egyptian reporters, such as Mona Eltahawy, encouraged the media to instead use the terms *uprising* or *revolution* to show that the movement had structure and a common goal. In addition, traditional media followed closely the social media feeds coming from Egypt and rebroadcasted many of the images and messages. This was especially important when media was banned from Tahrir Square, but through social media, citizens were able to become journalists and continue the dissemination of information.

The use of social media to organize and inflame the uprising was so significant that the Egyptian government on January 27 attempted to shut down the Internet and block cellular phones as activists were organizing more protests to begin after Friday prayers. Internet traffic dropped by approximately 90 percent as the few Internet access providers were told by the government to halt services. In spite of the efforts to take Egypt off of the grid, activists were still able to share information about how to access the Internet using dial-up connections in other countries.

At the same time, however, protest leaders began to be captured by the police, including Ghonim. Google issued a statement saying that Ghonim was missing and asked for tips as to his whereabouts without mentioning his role in the uprising. Google's statement went viral, and protesters began referring to Ghonim as their leader, while Facebook pages titled "We Are All Wael Ghonim" began to appear. He was released two weeks later.

In spite of the increasingly violent protests in the streets, Mubarak refused to step down. He did dismiss the government on January 28 and his cabinet on January 29. On February 1, he announced that he would not run for re-election

in September but again refused to leave office. On February 2, Internet services were restored after five days, and Google improved its Speak2Tweet technology for use by people in Egypt. Speak2-Tweet allows users to tweet on Twitter by leaving voice messages on international phone numbers, thus allowing social media use to continue even when Internet services are unavailable.

Approximately a million protesters continued to fill Tahrir Square, as foreign investors began to withdraw their capital from the country, and foreign governments, including the United States, began to issue statements indicating that it was up to the people of Egypt to determine who their leaders would be. Cyberactivists used the increasingly anti-Mubarak rhetoric to organize for a Day of Departure on February 4. After seven additional days of protests and violence, Mubarak announced on February 11 that he would resign as president and turn the government over to the military. This paved the way for Egypt to hold its first truly democratic elections in more than 7,000 years.

Democratic Elections and Continued Protests

Elections to the People's Assembly of Egypt, which took place in three parts from November 28, 2011, to January 11, 2012, occurred first. During the electoral process, there was continued concern about who would control the Egyptian government as well as whether the military would give up the powers given to it by Mubarak. Cyberactivists therefore continued to use the Internet to inform the world of the atrocities still being faced by Egyptians. For example, in December 2011, Tahrir Square was filled once again by Egyptians protesting that 17 women had been subjected to "virginity tests" by the military police after Mubarak left office. One of the female protesters was grabbed by the police, beaten, kicked in the stomach, and dragged through the street with her bra exposed.

The video of the beating of the girl in the blue bra went viral, and female activists took to social media to organize yet another demonstration in Tahrir Square for December 23, 2011. Thousands returned, with men forming a protective circle around the female protesters. While the identity of the girl in the blue bra remains unknown, one

of the 17 women who suffered the virginity test did come forward to sue the military police.

In spite of the continued protests, parliamentary elections took place. The Democratic Alliance, a coalition of 11 parties led by the Freedom and Justice Party created by the Muslim Brotherhood, secured approximately 45 percent of the seats in Parliament with the Islamist Bloc party receiving the next largest percentage of 25 percent. The elections, however, were ruled unconstitutional on June 14, 2012. After protests and rioting, the parliament was reinstated until a new election could be held in September 2012.

The presidential elections were also marred by controversy, including a dramatic constitutional reform by the military police that stripped the incoming president, Muslim Brotherhood candidate Mohamed Morsi, of many of his powers. It is yet to be determined if these reforms will stand. What is clear, however, is that Egyptians will continue to use social media as a tool for political discourse and reform.

18DaysinEgypt.com

18DaysinEgypt.com is a collaborative, cross-sourced documentary project and innovative experience in social media. It is aimed at capturing the revolution lived in Egypt during the 18 days of the uprising against the government in 2011, which finished with president Hosni Mubarak's defeat and exile. The "18 days" refers to the period between January 25, when the Day of Rage march against the regime was promoted through the Internet, to February 12, the first day of the democratic transition.

The project collects material related to the pivotal events that occurred during this period and were captured by cell phones, pictures, texts, tweets, or messages on Facebook. These materials are uploaded in an interactive Web site open to users even after the end of the events, and is continuously evolving. 18DaysinEgypt.com enables participants to chronicle the Egyptian revolution. The Web site introduces the concept of streams, collective narratives composed of social media snippets from multiple contributors. This innovative approach allows for each story to be told from multiple perspectives, giving the viewer an in-depth look at personal moments and events of the revolution. Streams featured on the site already cover a broad range of topics from pictures of protesters' humorous signs and art inspired by the revolution, to women chanting for freedom and songs about the revolutionary struggle.

Built by Egyptian software company Emerge Technology, the platform allows users to explore the stories and to build a community of wide-ranging narratives. 18DaysinEgypt.com is powered by GroupStream, a program for group storytelling that fosters collaborative narratives told together. It is also supported by the Ford Foundation, Tribeca Film Institute, Sundance Institute, and the Brooklyn Law Incubator and Policy (Blip).

The technological supply is a simple slideshow, allowing instant access to stories. The Web site 18DaysinEgypt.com solicits user-contributed stories with a beta tool called Groupstre.am. 18DaysinEgypt.com was originally created by documentary filmmaker and journalist Jigar Mehta and interaction designer Yasmin Elayat. They worked together with the community manager of the project Shadi Rahimi, a photographer and journalist

and cofounder of the media arts organization Seventh Native American Generation (SNAG). The clips always include the context and the date of the story and extra graphs and data nodes, creating a complex document that provides exhaustive and thorough information to the user.

The Web site organizes the material in four categories that help to associate similar users' contributions by: latest, recommended, popular, and date. This material, pooled by fellows, has text cards to guide the user through the contents. It is also available in two languages, English and Arabic. Apart from this basic team, 18DaysinEgypt.com counts on a number of fellows to help set the tone of the project and value the stories that work best on the site. The fellowship acts as a bridge between the online platform and the offline world, represented by Egyptians telling their stories. Moreover, the initiative has set out to raise at least \$18,000 in order to fund 20 aspiring or established Egyptian journalists to collect stories from eyewitnesses throughout Cairo. Six fellows were funded for six weeks to focus on stories in Cairo: Sara Elkamel, Nesma El Shazly, Mostafaa Sheshtawy, Mohamed Abd El-Hamid, Carmel Delshad, and Dina Fergani. The project was also supported by platforms like Kickstarter.com, a service to fund creative projects, which sent journalists to other Egyptian cities like Luxor, Aswan, Suez, and Alexandria.

The material hosted has a very eclectic and heterodox nature, from personal experiences in Egypt to analysis and opinions all over the world. Some of the clips are more traditionally narrative-driven, and others are just graphic or text material of personal experiences. Clicking on any of the bylines, the user can pull up a participant page and see all the stories that one person has contributed. The process of reaching out to people to tell stories is a multifaceted campaign: first, through a social media outreach, especially Facebook and Twitter; second, students of the American University in Cairo or nongovernmental organizations who did work throughout the revolution and contributed actively to create stories; and finally, professional filmmakers who made films about the revolution.

Aside from the content related specifically to the demonstrations and protests, some other subjects were detailed once the conflict was over,

including the wish for a constitution and a referendum, hopes for Mohammed Morsi and Ahmed Shafik as candidates in the elections and Omar Suleiman as Hosni Mubarak's successor, the trials of the military and civilians, the links with Syria and the Arab Spring, and the sexual harassment that occurred among the population.

Postrevolution Content

Once the events of the Egyptian revolution were finished, 18DaysinEgypt.com changed course and evolved from a different perspective. The subsequent material explored the implementation of real freedom after the overthrow of the dictatorship and showed the struggle to achieve freedom beyond the revolution. The next contributions turned into a number of reflections on democracy and the Mubarak trial, as well as the presidential election on May 23 and 24, won by Mohammed Morsi.

A change occurred on the platform after the dramatic events of February 1, 2012, when a soccer match between the Al-Masry and Al-Ahly teams turned deadly in Port Said. The conflict was immediately politicized, as the Al-Ahly supporters were allegedly involved in the uprising and Al-Masry followers mostly sided with the former dictator. Anti-Mubarak activists accused the Supreme Council of the Armed Forces, still in the government, of consenting and organizing the confrontation. The date also coincides with the first anniversary of the Battle of the Camel, when armed mercenaries stormed protesters in Tahrir Square.

The 18DaysinEgypt.com fellows gathered personal interviews and collected firsthand resources from on the ground to create a stream capturing little-known details of the Ahly Massacre. This marked a turning point in the contributions to the platform after the revolution, as the deaths originated a number of marches and demonstrations and several protests against the action of the council. As the clashes continued, 18DaysinEgypt.com focused on stories from the frontlines, including those about women, businesses that stayed open despite being surrounded by violence, motorcycle ambulances, and the tough task of negotiating a truce.

Election Monitoring

The role of trust in democracy, democratic government, and political participation has been receiving more and more attention in political science and in the wider public recently. A particular concern among professional researchers and scientists as well as experts in electoral public moods lies in the declining level of democratic engagement in traditional politics exacerbated by media reports of politicians' untrustworthy behavior. Therefore, election monitoring is a powerful tool in promoting democracy, political rights, and good governance. Among the techniques being used to overcome these challenges is an attempt to use social media to monitor upcoming elections for irregularities and violence as well as to inform the public about the electoral process.

Various activists and groups monitor election campaigns through social media activities in order to discover the level of support for each candidate, to describe the general discourse, and to observe reactions to candidates' talks and debates. The resulting picture drawn from social media reactions can make for interesting comparisons with electoral public opinion surveys conducted by research agencies and published in news media.

The practice of election monitoring has been developing over the years, and technology is key in

enhancing the efficiency of observation. Observers now have the opportunity to cover large samples across large geographic areas, capture data from polling centers, and report observations to central operations centers where the data is collected, organized, analyzed, and followed by periodically released public statements on the overall conduct of elections across a country.

New media and technologies may be widely applied in election monitoring, including blogs, social networking sites (Twitter, Facebook, Myspace), Google Maps, mobile phones (short messaging service [SMS], multimedia messaging service [MMS], mobile photos/videos), or Skype. The new features of social media important for successful election monitoring are the opportunity for two-way communication, the ability to address people worldwide, the opportunity to get the first stories of violations coming from citizens; the capability to broadcast low-resolution content on high-definition media, and having content from ordinary people added to reports from professional journalists. Challenges in using social media for election monitoring include that it is increasingly hard to ascertain the impartiality and accuracy of coverage, postdisaster communications can be unreliable and difficult, and information on election violence may not indicate an actual political party's behavior.

The new technologies give voice to many citizens. New information should still be perceived in a skeptical way, but the use of new media is pushing and pulling content during an election. Media literacy is necessary for embracing new technologies. Election reporting tool kits now include Rich Site Summary (RSS), Web sites, Wikipedia, podcasts, vodcasts, Google News alerts, and Alertnet for pulling content, and vodcasts, podcasts, blogs, Flickr, SMS, and mobile photos/videos for publishing the content. For both publishing and pulling content, YouTube, SMS and mobiles, Twitter, Facebook, and blogs are used.

Center for Monitoring Election Violence

One example of how a nongovernmental organization has initiated and carried out election monitoring using social media engines is the Center for Monitoring Election Violence (CMEV) in Sri Lanka. It was established in 1997 by the Centre for Policy Alternatives (CPA), the Free Media

Movement (FMM), and the Coalition Against Political Violence as an independent and non-partisan organization to monitor the incidence of election-related violence in Sri Lanka. Currently, CMEV is made up of CPA, FMM, and the INFORM Human Rights Documentation Centre.

In 2011, CMEV conducted the monitoring of elections in Sri Lanka using such social networking sites such as Facebook and Twitter as well as online video on the official Web site. The maps of incidents and violence were published on the CMEV Web site using the Google Maps platform. At the end of polling, CMEV had recorded 56 election violations in the elections to the 91 local bodies it monitored. Of these 27 were major incidents and 29 were minor incidents. The major incidents included one report of murder, a grenade attack, seven incidents of assault, seven incidents of intimidation including five reports of an intimidating presence around the polling station, the obstruction of polling agents and voters and election monitors, as well as the chasing away of voters.

In the elections conducted in Tunisia and Egypt in 2012, young citizens and domestic election observation coalitions were increasingly relying on social media to inform the world about the developments pertaining to the conduct of elections. The world was able to read observations uploaded by active citizens who were collecting data and using Twitter and Facebook to share it with the world. They protected the integrity of the election by trying to ensure that it was free and fair.

Ushahidi

Ushahidi is a tool for election monitoring and has been deployed in a number of countries for that purpose. It was developed by the nonprofit tech company of the same name that specializes in developing free and open source software for information collection, visualization, and interactive mapping. The word *ushahidi* means “testimony” in Swahili, and it was a name of the Web site initially developed to map reports of violence in Kenya after the postelection fallout at the beginning of 2008; that Web site had 45,000 users in Kenya. Examples of crowdsourcing (receiving reports from the general public) during elections include India, Mexico, Afghanistan, and Lebanon, all in 2009, and Sudan and Togo in 2010. Data collection using trained election

monitors can also be done, and Ushahidi was used in this way during the November 2009 elections in Namibia and during the 2010 elections in Burundi.

The developers of this platform emphasize the necessity of early planning if one aims to apply Ushahidi to election monitoring. That is essential because disseminating information across an entire country will take time. The ideal moment to start using the platform is at least six months out, as it is for using it for monitoring something other than elections, such as monitoring traffic, crime, or corruption. The key is to have users familiar with the platform so they can see the added value well before the elections take place. This will help to expand buy-in in the lead up to the elections.

The next decision that initiators of the monitoring need to make is whether the project will be open so that anyone can report on election irregularities or whether the group of monitoring initiators will mobilize trusted networks to do the reporting. Both options are possible, and that is what the developers recommend. The advantage of combining both approaches is that this increases the possibility of triangulating and validating incoming reports.

Before turning to sourcing and handling incoming data, it is necessary to select the categories that will be used for the monitoring. The developers suggest such examples as fraud, vote tampering, illegal campaigning, and removal of observers. Considerations about incoming data raise the following question: What combination of technologies will be used to carry out the reporting? There are advantages and disadvantages to each that should be considered, including cost, usability, security, and amount and quality of incoming information. Ushahidi is usable on mobile phones and on e-mail/Web for online media monitoring.

Using Ushahidi’s smartphone applications makes the reporting free, more secure, and automatically geotagged. If SMS is used, one can either set up a number using a service like Clickatell or FrontlineSMS, or approach the country’s telecom company to set up a “short code.” A short code is a three-to-four-digit number that can be made free for users who text that number. One advantage of using SMS is that it gives the opportunity to get a lot more individuals involved in the reporting. However, there is a disadvantage: it will be necessary to map the events being reported based on

the location information provided in the incoming text messages, which can be time consuming. Developers of Ushahidi also work on Swift River to automate the geo-location process whenever possible.

Election observers could also report on election violations by sending e-mails to a dedicated e-mail address. These e-mails should include detailed location information to make the mapping as easy as possible. The same approach can be taken using Twitter and a dedicated hashtag and/or Twitter feed. Customized Web forms can also be created as part of the Ushahidi instance that will allow people to submit detailed reports, including geographic information and categorization.

Online media monitoring is another question. It is important to decide in advance whether one wants to complement the on-the-ground monitoring with online media monitoring. The latter includes reading through official news, Twitter, blogs, and Facebook groups to find relevant election-related events that can be mapped. This is a time-consuming effort, however. The Ushahidi developers recommend considering the option of recruiting volunteers to help in combining the news during the elections. This produces a rich set of information when combined with reports coming in from the ground. It is possible to map pictures and video footage as well.

Reporting strategies using Ushahidi also vary. If one aims to proceed with traditional election monitoring at polling stations, it is necessary to have trained and dedicated monitors deployed to these stations in such a way that the data they generate is statistically representative. If the group of activists is more interested in crowdsourcing the election monitoring, then it is better to maximize the number of users who report on election violations. Both approaches can be combined.

Carrying out of the steps listed above will differ if the country in question is democratic versus authoritarian. In the case of the latter, extra precautions should be taken to maximize the safety of those who contribute to the election monitoring. This may mean using secure smartphone applications, or code when using SMS.

PakVotes

“PakVotes” is an election monitoring citizen journalists’ platform in Pakistan. According to its

developers, it is an initiative that aims to highlight the voice of ordinary citizens through citizen media to generate an alternate narrative of the 2013 electoral contest. Using social media tools, it encourages openness through citizen participation and tries to provide timely and reliable information. The focus is to increase citizens’ ownership of the democratic system. The innovative citizen journalism portal aims to empower the common people to voice their opinion on the upcoming elections; cite any code-of-conduct violations before, during, and after the upcoming elections; and report incidents of violence or rigging.

As of 2013, the project has trained 40 field monitors from the most remote and most violence-prone areas around Pakistan. These field monitors are reporting election problems in real time to the platform from remote regions, which might often be ignored by the mainstream media. The project can be followed on Facebook and on Twitter. All witnesses of violence in Pakistan can report it to PakVotes. This platform allows Pakistani citizens to learn about elections and the electoral process via social media in order to urge them to vote.

The PakVoters site also provides information and links for informed voting decisions, while offering the information in a neutral and apolitical way. This process does not begin and end with elections—it is an ongoing endeavor and will require constant and long-term engagement of Pakistanis to not only vote, but also remain active after elections and hold the winners accountable to their mandate. Thus, the additional advantage of using social media in the electoral monitoring process is in empowering citizens to take a more active role in voting and in engaging people in maintaining democratic regimes in their countries.

Electronic Frontier Foundation

The Electronic Frontier Foundation (EFF) is a donor-funded nonprofit organization that aims to protect the public interest regarding new technologies. The EFF employs a mix of lawyers, policy analysts, activists, and technologists. The staff keeps track of current developments about technology and the law, both in the United States and abroad; advocates for particular laws and policies; and educates the public about these issues. In recent years, much of the EFF’s work has centered on challenges to the public’s use of social networking technologies such as Facebook and Twitter. The EFF monitors not only governmental actions but also the policies and practices of corporate entities as they impinge on public use of technology.

The EFF was founded in 1990 following the U.S. Secret Service’s seizure of electronic equipment from a small business, Steve Jackson Games. Jackson’s business was severely impacted as the equipment was kept four months for examination; upon return of the business’ computers, it was discovered that e-mail sent in by nonemployees to the company’s electronic bulletin board system had been accessed and deleted. Jackson searched for an organization willing to pursue what he felt were serious violations of his civil liberties, but none of

the then-existing groups understood the technology well enough to appreciate fully the ramifications of what had happened. Three people who were part of another online community agreed to take on Jackson’s case, created the EFF, and successfully filed suit in federal court against the Secret Service. This was one of the earliest cases to begin creating a legal framework for digital media. Lawsuits challenging government and corporate actions continue to be an important part of the EFF’s efforts.

Current developments at the intersection of law and technology are chronicled on the EFF Web site, <https://www.eff.org/>. There is a general feed of information on the home page and more specific links of interest on each of the following topics: free speech, fair use, innovation, privacy, and international and transparency. EFF maintains its Deeplinks blog, offering analysis of current events as written by EFF staff. Staff members also write more thorough analyses of important issues in the form of white papers. The EFF Web site is one of the major tools used to educate the public about their rights. There are multiple projects the organization is highlighting. The projects that apply most directly in the area of social media and politics are summarized briefly below:

- *Bloggers’ Rights*: EFF has created a legal guide for bloggers in the United States summarizing relevant issues such as defamation law, intellectual property, and privacy. EFF also reminds bloggers of their rights to blog anonymously, to engage in political speech, and for online journalists to be treated the same way as their offline peers.
- *Coders’ Rights*: EFF defends the rights of programmers and developers to explore cutting-edge technology. There are several sets of frequently asked questions provided for different types of issues that may arise, particularly in the area of security and encryption software.
- *Free Speech Weak Links*: This project identifies and explains the intermediaries that stand between communicators and their audiences on the Internet: Web hosting services, upstream providers, the domain name system, Internet service

providers, search engines, payment service providers, and third-party platforms. It details the pressures that these entities face and gives examples of how each has effectively censored expression in particular circumstances.

- *Global Chokepoints*: This project is an international effort similar to Free Speech Weak Links but with a particular emphasis on global efforts to use Internet intermediaries to enforce copyright.
- *Open Wireless Movement*: The EFF advocates a system of open wireless connections as a means of improving access but also as a way of lessening the ability of any particular user to be tracked by government or corporate interests. EFF is part of a coalition of volunteer engineers working to create technology that would allow users to open their wireless connections without sacrificing security or slowing their own service.
- *Surveillance Self-Defense*: This project seeks to inform members of the public in the United States about the laws and technology used for government surveillance of digital media. It also summarizes legal ways to protect oneself against such spying.
- *Transparency Project*: Using primarily Freedom of Information Act requests and lawsuits, the EFF monitors and reports on the government's use of technologies for law enforcement and national security. For example, EFF was instrumental in uncovering information about the use of unmanned drones for domestic surveillance.

Electronic Privacy Information Center

The Electronic Privacy Information Center (EPIC) is a nonprofit research center funded through foundation grants, individual donations, and sale of its publications. The stated aim of the center is "focusing public attention on emerging privacy and civil liberties issues." Founded in 1994, the center serves as a clearinghouse of information about privacy, government transparency, freedom of expression, and general civil liberties. EPIC has a particular emphasis on privacy issues raised by new technologies and content forms, including social media.

The center was created by lawyers Marc Rotenberg, Dave Banisar, and David L. Sobel, who worked together at the Washington, D.C., offices of Computer Professionals for Social Responsibility. Their initial backing came largely from the Fund for Constitutional Government. The center became an independent nonprofit in 2000. Initial projects focused on government surveillance and encryption, but the scope of its work quickly expanded to encompass a range of privacy issues posed by government and private entities.

EPIC directs public attention to privacy and civil liberties issues using several strategies. First, it maintains an extensive Web site at epic.org. In conjunction with the group Privacy International, it also provides content to privacy.org. Both sites provide thorough summaries of current events and policy issues related to privacy. They also provide links to other groups that address privacy issues and information about practical privacy tools members of the public can use, for example, to protect their e-mail accounts against snooping, surf the Internet anonymously, or establish firewalls.

The group publishes an electronic newsletter every two weeks, the *EPIC Alert*. The newsletter

has a readership of more than 17,000 and is sent free of charge to subscribers' e-mails. The newsletter includes updates of privacy-related developments in the United States and globally, reviews of recent publications that address privacy issues, and lists of events and conferences of interest to subscribers.

Conferences, invited presentations, and publications are other ways EPIC provides information to interested parties. The group hosts multiple conferences a year, and staff speak at relevant events held by other organizations. EPIC produces publications summarized at its online bookstore and available for purchase through Amazon.com. Examples of its works include "Litigation Under the Federal Open Government Laws" (2010) and "Privacy and Human Rights 2006: An International Survey of Privacy Laws and Developments."

In addition to providing information, EPIC engages in advocacy to influence policy decisions and court cases and to enhance government transparency. EPIC makes regular use of the Freedom of Information Act (FOIA) to gain access to government records of agencies such as the Federal Trade Commission (FTC), the National Security Agency, and the Transportation Security Administration. The group also participates in lawsuits regarding privacy issues, both in the role of primary counsel and by submitting friend-of-the-court briefs. EPIC has identified more than 30 hot policy issues, which include a vast span of privacy-related matters, from the use of full-body scanners in airports to the privacy of medical records and the use of unmanned drones in domestic surveillance.

At least a third of EPIC's identified policy issues impact the use of social media for political purposes. The major concerns involve unauthorized collection of personal information by private entities or the government and the vulnerability of that private material to being shared with third parties.

EPIC has, for example, filed complaints with the FTC against Facebook and against Google's social network component, Buzz. EPIC argued that the policies and practices of these social networking sites are unfair and deceptive because the companies aren't clear about what information will be gathered and made available to the

government, to members of the public, to advertisers, and to third-party application developers.

Cloud computing is another identified topic on EPIC's radar. Cloud computing refers to software, data, or processing power that is stored on remote servers and managed by a third party. The security of that information varies depending on the techniques the service provider uses to protect it. Data stored in the cloud is, by statute, easier for law enforcement officials to have access to than if the same information was stored on a private computer.

Tracking of individuals' movements in cyberspace and in real space are also matters of concern to EPIC. Various methods can be used by companies and by the government to track online sessions, including Web sites visited and terms used in search engines. Some of this tracking is done for the purpose of customizing content for each user, targeting them with links and advertisements that reflect their interests. Agencies of the government have also used tracking for investigative purposes. An increasing number of mobile devices and applications track a person's geographic location in real time, which has multiple implications in terms of safety and freedom of association.

Electronic Voting

In the finale of *American Idol*, season 10, 122.4 million votes were cast via varying electronic means for finalists Scotty McCreery and Lauren Alaina. Over the course of that season, more than 730 million votes were generated by a wide range of Americans using text messaging, call-in numbers, Facebook, and an app. The same types of numbers have emerged over all 12 seasons of *American Idol* and have led to public questioning of why politicians have not worked harder to find a way to permit such convenient voting mechanisms when a dramatic increase in participation could occur. Advocates for moving toward social media voting point to groups like Major League Baseball (which uses online voting for a large portion of all-star game selections) and online polls and surveys as evidence of how turnout would dramatically increase if voting was easier. Detractors, however, point to the same organizations and polls for explanations on why not to make voting that simple. Major League Baseball suffered a ballot stuffing controversy in 1999, and online polls are susceptible to repetitive voters (once a user deletes cookies on his or her computer). Decision makers will need to assess the costs and benefits of bringing the *American Idol* form of democracy to the selection of public officials and votes for public policies.

There are various types and degrees of electronic voting that occur throughout the United States. It can involve casting an electronic ballot, or electronically counting ballots that have been cast through nonelectronic means. Electronic voting mechanisms that are presently used for governmental purposes across the United States include optical scan systems, punched cards, and direct-recording electronic voting (electronic voting machines). Methods used in nonpolitical contexts include voting by phone, computer networks, and the Internet. There are two main types of electronic voting: one utilizing electronic means while still supervised by election representatives, and one performed solely within the influence of the voter. For example, a voter may touch a screen on a voting machine at an official polling location, or use a personal iPhone. While electronic voting is largely viewed as more efficient and effective, it comes with severe risk of fraud.

These researchers in the vulnerability assessment team at Argonne National Laboratory were testing electronic voting machines for vulnerability to tampering in January 2012.

Electronic voting in the United States debuted in the early 1960s with the advent of punch cards that could be electronically counted instead of by hand—dramatically decreasing the time in which results could be announced. It was first used in the 1964 presidential election in a small number of counties. Later, optical scan systems became popular. After voters fill in the appropriate circle, the scanner can quickly tabulate results. The most recent development—and the most technologically advanced and controversial—is direct recording electronic voting machines (DRE). These tools are universally utilized in several countries and quite prominently in the United States. In these systems, voters cast their ballots by using a touch screen to mark their selections. The votes are internally tabulated by the machine and can be sent through a network to a central location that allows for immediate tabulations. Further, a paper audit trail can be printed for each machine. DREs first became popular after 2002 when the Help America Vote Act required every

polling place to have an accessible system (and DRE is considered accessible). In 2004, statistics show that over one in four voters in the United States used some form of DRE. This compares to fewer than one in 10 from 1996.

Advantages

The first advantage is the efficiency offered by electronic voting mechanisms. The 2012 presidential election had 126,226,713 votes cast across the country; imagine the amount of time, effort, and money it would take to hand-count each of those votes. Then, there would be the need to aggregate votes across jurisdictions before arriving at state totals—the time required would be significant. Whether paying election workers or counting the number of hours volunteered to do the counting, it is significantly cheaper to utilize electronic means as compared to hand-counting ballots.

Electronic voting is not only more efficient, but is also more effective. Further, the opportunities for human error are clustered. Each time that the votes per candidate are sent forward for aggregation, there is a potential for error. The potential for human error in miscounting a ballot is quite large. Even more problematic, however, would be recount situations. Each individual ballot would need to be secured until all elections for a jurisdiction were certified and not facing legal challenges. In the time between a cast ballot and the conclusion of legal proceedings, there would again be numerous opportunities for a single ballot to be misplaced or damaged, causing inaccurate results. When electronic voting is utilized, a machine is handling all counting and ordering—largely eliminating many of these concerns. There are no concerns about misinterpreting what someone meant (e.g., Florida in 2000), or of a misplaced ballot.

There is also a significant environmental benefit from the utilization of electronic voting. When paper ballots are used for an election, federal law permits (but does not require) them to be destroyed 22 months after the date of the election. Each state has protocols on this matter, but printed ballots are never recycled. They are either destroyed or stored—both of which are environmental drains because of the sheer volume. Even more problematic is that the number of paper ballots needed is significantly more than the expected

turnout so that polling stations do not run out in any given jurisdiction. This guarantees waste, regardless of what occurs to used ballots. Electronic voting (particularly DRE and Internet-based) eliminates this concern.

Electronic voting also presents numerous benefits related to accessibility. The most prominent way it does this is by offering opportunities for individuals with disabilities (which explains the initial growth of DREs in 2002). DREs permit those who are blind (the most problematic disability from a ballot perspective) to have instructions and ballots read to them via headphones. Further, the machines can be calibrated to assist those with limited mobility. Considering the growing diversity of the United States and the potential need for ballots in multiple languages, DREs can be loaded with various forms of the ballot, permitting voters to be presented with their choices in the language most comfortable for them.

Perhaps the greatest advantage offered by electronic voting through the Internet or other direct means is what it means for democracy. While the United States has taken great efforts to ensure that everyone has an opportunity to participate in elections on the first Tuesday after the first Monday in November, voting is still largely regarded as an inconvenience by many potential voters. Voting occurs during the week, and is not recognized as a holiday. Citizens must either take off from work or go before or after work. Despite the technological revolution, there are still lines (significant at times). Further, the sheer volume of elections each year in the United States leads to fatigue. If individuals could vote via the Internet, cell phone, or other self-controlled mechanism, participation would likely increase and would benefit individuals who at present are considered disenfranchised because they are unable to get off of work or access polling locations.

Two groups that could particularly benefit from more innovative electronic voting would be individuals who are deployed with the American military and those suffering natural disasters at the time of an election. At present, deployed soldiers are only able to vote for federal offices and receive their ballot by mail, fax, or e-mail. They fill out the ballot and then send it back via mail, needing it postmarked on or before Election Day and received by 4:00 PM on the Friday following

Election Day. Ballots cannot be returned electronically. If overseas military could vote through electronic means, this would drastically cut back on the costs of ballots returned, reduce the hassle for servicemen and -women when trying to vote, and eliminate possible delays that could make their votes go uncounted. In terms of disasters, electronic voting could have helped in November 2012. In the wake of Hurricane Sandy, voters in the New York City metro area (in both New Jersey and New York) were able to walk into any precinct they could access and request a ballot to vote at that location. If there are concerns about voter fraud using the Internet, the same concerns could be voiced when voters are given free rein to vote where they want. The difficult part of Hurricane Sandy is that at the national level, it made no difference. Both New Jersey and New York were solid Democratic states, meaning the potential changes in venue did not necessarily matter. However, at the state and local level it was complete chaos, heavily impacting lower-level races. With electronic voting available, the situation could have been avoided.

Disadvantages

There are three common objections most frequently raised to electronic voting: familiarity, cost, and fraud. The familiarity issue is especially pertinent with older voters who are accustomed to more traditional means of casting ballots. DREs and butterfly punch cards can be intimidating for individuals who are not familiar with the technology. Likewise, asking these voters to cast a ballot online from home may be impossible. Maybe they do not have a computer or Internet access. What electronic voting should not do, however, is scare voters out of participating.

The cost of electronic voting is also frequently mentioned. Whereas printing paper ballots is not environmentally friendly, purchasing the requisite number of DREs or scanners or online voting software is not budget friendly. These tools require a significant capital investment when purchased and incur maintenance costs throughout their lives. Add in the cost of validating results and performing the necessary audits, and the cost of running an election can be roughly the same as when using paper ballots. Since state governments are charged constitutionally with conducting

elections, the cost falls directly onto the already strapped budgets of this level of government.

The most frequently cited concern of electronic voting is susceptibility to fraud. Major League Baseball presents a great example. In 1999, with Red Sox shortstop Nomar Garciaparra roughly 20,000 votes shy of Yankee shortstop Derek Jeter only three weeks from the All Star game, a computer programmer created a program that immediately gave him an additional 25,259 votes—netting him a starting spot in the game. While the online ballot program was fairly primitive and was not designed with any real intent to keep hackers out, it exposes how dangerous online voting can be. DREs can be equally concerning. Viruses, hacking, and physical tampering could possibly influence the outcome of an election if someone is successful in influencing the numbers within a DRE or the network between one machine and the tabulation center. No matter how secure a network or machine seems to be, someone always seems able to get in. Likewise, there could just be unfortunate problems with the machines (even in the absence of any activity to cause the machines to produce errors).

From the world's short history of electronic voting there is already a collection of cautionary tales about when new methods do not work out as intended. In 2003, voters in Virginia noted that DRE machines would uncheck who they voted for after a few seconds. If the voters had not noticed, no one would have caught the error. Even the best audit of DREs can only describe what the machine entered, not what the voter actually intended. A year later, after having nonfunctioning machines, Diebold (now Premier Election Solutions) was sued by Alameda and San Diego Counties and had all of their machines decertified by the state of California. They ultimately settled for \$2.6 million. Electronic voting across the United States was particularly rough in 2006. In three Florida jurisdictions, early tests showed calibration problems that led to misvotes by voters. Many voters in Pennsylvania, Indiana, and Ohio were forced to resort to paper ballots because of software problems; in Ohio, it was even worse around Cleveland when printers jammed in the DREs, making paper copies of votes impossible to gather. In Arkansas, a mayoral candidate claimed that there were serious errors when his home precinct

showed him collecting zero votes (despite his continued assurance that he had in fact cast a ballot for himself). In 2008, more errors occurred when machines in three states (Tennessee, Texas, and Virginia) all flipped votes. For example, a vote for John Kerry would appear in the results as a vote for George W. Bush, even though it looked right on the screen. Again, this error would never have been noticed by a voter. Other states had votes disappear, or Spanish ballots were not counted at all. Similar scenarios emerged in 2010 and 2012. While all of these incidents may seem minor, they are the sort of occurrences that shake citizen confidence in the voting process and, consequently, democracy as a whole.

If these real-world examples were not enough to sway voters against electronic voting, four major popular portrayals have emerged. *Man of the Year* (a 2006 Robin Williams movie) highlights a software error that causes voting machines to incorrectly tally votes. *Runoff* (2007) traces an election in which a hacker is able to defeat security on e-voting to fix the numbers. *The Campaign* (2012) traces a similar story and strongly implies that prominent backers of one candidate utilized voting machines to guarantee the desired outcome. And *Hacking Democracy*—a 2006 HBO documentary—looks at the actual anomalies and irregularities experienced by voters in Volusia County, Florida. The documentary's most shocking contribution, however, occurs when the filmmakers successfully hack into an election system in Tallahassee.

There are both reasons to embrace and fear electronic voting in the United States. While America has embraced types of electronic voting that utilize electronic means while still supervising voting with election representatives, it has been less open to forms that are performed solely within the influence of the voter. Americans are skeptical of DREs (possibly for good reason), but do not accept online voting—at least for now. Congress has pushed for greater security for any type of electronic voting, and the House of Representatives in 2008 went as far as to suggest reimbursing states for the extra costs of having paper ballots ready in case of a technology issue. Further, the House bill called for states to be reimbursed the costs of paying auditors and hand counters that had to be hired. In doing so, the hope was that

those who did not trust electronic voting could still participate through more traditional means. The bill suggesting these changes, however, has yet to be voted on by either congressional body. In the end, the debate is as much theoretical as it is practical. Do Americans want to see voter participation increase? Or do they worry too much about providing new avenues for fraud to justify the addition of new voters to the electorate? Either way, there will continue to be incremental movements toward more utilization of technology and electronic voting.

Ellison, Keith

With just over 32,000 Twitter followers, Minnesota two-term Congressman Keith Ellison does not actively cultivate a large social media audience. Despite Ellison's relatively small number of followers, he nonetheless constitutes a significant social media footprint largely maintained by a significant number of conservative and oppositional bloggers. Ellison is Minnesota's first African

American and the United States' first Muslim member of Congress. Ellison's history as a Catholic-turned-Sunni Muslim activist concerned with human rights and voter disenfranchisement appealed to his ethnically and religiously diverse constituents and helped him win a historically Democratic district in the Minneapolis metropolitan area. However, this same history—containing former ties to the Nation of Islam (NOI) and later renunciations of those ties, with offering his political support to someone offering less-than-flattering insinuations about Jews and racism, and with current allegations regarding “associations” with the politically motivated Muslim Brotherhood organization—antagonizes political opponents who view him with deep suspicion because of his professed Muslim faith.

Social media platforms—including Twitter and blogs—are especially adept at allowing users to quickly circulate and respond to rumors. It is these same platforms that enable oppositional social media users to respond to and call into question established television and print media coverage of Ellison. Indeed, social media users keep Ellison a very popular subject.

Activism

Julie Woodbury has observed that Ellison's history of activism explains his current notoriety among conservatives concerned about the influences of radicalized Islam on U.S. life. According to Woodbury, Ellison presented himself as an easy target for political opponents during his initial run for Congress. As a law student at the University of Minnesota, Ellison penned several articles supporting Louis Farrakhan, minister and leader of the NOI. Because Ellison actively recruited members and other participants to attend the Million Man March in 1995, he became identified as a formal member of the NOI, though he denies such claims. Woodbury noted that Ellison needed to distance himself from the NOI and whatever involvement he had with the organization if he was going to avoid alienating his Jewish voters. Disassociating from the NOI was important for Ellison if he wanted to deny that it represented mainstream Islam. In addition, Ellison needed to take back some comments he made supporting a then-executive director of the Minneapolis Initiative Against

Racism who allegedly claimed that Jewish individuals are some of the most racist white people. He disavowed the director's comments and expressed regret over not properly scrutinizing Farrakhan's anti-Semitic and racist remarks.

Minnesota's 5th Congressional District covers the city of Minneapolis as well as the suburb Saint Louis Park, which contains a strong Jewish community. As a result, Ellison's background was both uniquely suited for his district even as it presented significant hurdles to overcome.

Controversy

Certain elements of Ellison's history irked Jewish and conservative bloggers the most during the 2006 Democratic primary: he only recently disavowed the militant and anti-U.S. government elements of Farrakhan's rhetoric and his past dismissal of the anti-Semitism present in NOI messaging. Some Jewish and conservative voters found Ellison's expression of contrition to be disingenuous.

Woodbury notes how the conservative blog *Power Line*, *Time* magazine's 2004 blog of the year and the site whose coverage led to Dan Rather's dismissal at CBS, began to post letters Ellison wrote to the student newspaper while attending the University of Minnesota. These letters supported Farrakhan and reparations for African Americans and called for black nation within the United States. *Power Line*'s coverage was among the first uses of social media to portray Ellison as a racist, anti-Semitic candidate outside the mainstream of Minnesota and U.S. politics.

Woodbury notes that, because of unflattering attention in local and the influential *Power Line* blogs, Ellison was the subject of withering criticism in the months leading to his election. Oppositional bloggers were very effective at portraying conventional media, especially the local newspapers, of not asking the tough questions of Ellison's past due to his being a racial and religious minority. Natch Greyes implies that just as political figures can employ social media to foster and deepen followers' connections to campaign messages, so too can savvy oppositional bloggers deepen the salience of a message when it appears that message is being ignored or suppressed by either the targeted political candidate or from some other media outlet. Most of the 5th

congressional district of Minnesota identifies as diverse and politically progressive, so the effect of oppositional, adversarial social media on the district's voters is hard to gauge, especially among Jewish voters. Woodbury reports that many in the political blogosphere seemed to think that Ellison's campaign got a significant boost when Mordecai Spektor, publisher of the *American Jewish World*, a weekly newspaper serving Minnesota's Jewish community, endorsed his candidacy. Spektor's endorsement did not reflect a significant majority of the Jewish vote, but it did nonetheless indicate to some that Ellison's past affiliation with the NOI and subsequent renunciation of it and its anti-Semitic elements was a good-faith gesture worthy of supporting the candidate.

Ellison frequently downplays his religious faith, claiming that it is not a "big deal" and has asserted that he is not a religious leader of any kind. While those declarations were persuasive enough to some of his concerned constituents, they were not credible enough to oppositional bloggers who pointed to Ellison's staged swearing-in ceremony as proof of his continued devotion to a politically motivated version of Islam. All new representatives to the U.S. House of Representatives take the oath of office together. The iconic pledge featuring a hand placed on a symbolically important book is typical of judge swearing-in ceremonies. Regardless, Ellison decided to symbolically reenact the swearing-in ceremony by placing his hand on Thomas Jefferson's copy of the Quran. Ellison's stated purpose for staging the photograph was to celebrate religious tolerance and to celebrate the occasion of the first Muslim being elected to Congress. Because the act of staging the picture was voluntary, oppositional bloggers saw it as a calculated attempt to demonstrate Ellison's true religiously motivated political commitments.

Woodbury points out that, even though there were significant numbers of non-Christians in Ellison's class, including Jewish members, Buddhist, and even an agnostic, his decision to publicize his swearing-in ceremony was bound to draw critical attention from the blogosphere. Conservative blogs extensively covered Ellison's reenactment. Some Republican representatives took to Fox News to express that both they and their constituents were deeply concerned by the precedent set by Ellison. In the wake of his election,

and the increased visibility that accompanied his being the first Muslim elected to Congress, Ellison faced the option of downplaying this fact or celebrating it. The media-friendly Quran pledge was an iconic image that for both Ellison's supporters and detractors helped define him to this day. President Barack Obama referenced the event a few years later in an address to Muslims in Cairo, Egypt, telling his audience that Ellison's act is proof that Muslims have a powerful and positive influence in American affairs.

Shortly after his swearing-in ceremony, and in the middle of ongoing media attention to his now-famous picture, Ellison appeared with conservative commentator Glenn Beck on *CNN Headline News*. Beck, by then an established radio personality, likely had some inclination as to how the conservative blogosphere, the site for most oppositional positions that circulated about Ellison, reacted to Ellison's use of Jefferson's Quran in his photo. Beck notably informed Ellison that he, like many Americans, especially those who formed the audience of his show, wanted Ellison to prove that he was not sympathetic to radical Islam, with its focus on Sharia law and jihad. In response, Ellison affirmed his patriotism and disavowed Muslim extremists. After the show's taping, Ellison told the hometown Minneapolis *Star Tribune* (long a subject of scorn for its unwillingness to scrutinize Ellison's past to the extent *Power Line* and other Minnesota-based blogs felt was warranted) that he felt Beck's questions were outrageous. Conversely, bloggers from *Power Line* and other conservative social media sites thought differently.

Domestic Terrorism

In 2011, New York Republican Representative Peter King, chair of the Homeland Security Committee, convened hearings on the problems of radicalization among American Muslims and the potential resulting acts of domestic terror. The hearings were a timely response to the media uproar that ensued a few months before regarding the proposed mosque and cultural center to be built near the Ground Zero site of the fallen World Trade Center towers. Ellison made an appearance before the committee to tell the story of a Muslim medical technician, Muhamed Salman Hamdani, who volunteered to help after the World

Trade Center towers had been attacked. Sheryl Gay Stolberg and Laurie Goodstein note that Ellison broke into tears when describing Hamdani's bravery. When the body of Hamdani went missing, some alleged he may have had something to do with the terror plot against the World Trade Center. It was not until Hamdani's remains were found before he was vindicated.

In response, the conservative Media Research Center decried Ellison's actions as political theater. Other conservative oppositional blogs registered similar reactions. Other more sympathetic blogs, like the *Huffington Post* and *Politico*, registered Ellison's emotional display as truthful, heartfelt, and sincere. Traditional media outlets, including the *New York Times* and the Minneapolis *Star-Tribune*, and national television reports tried to gauge the various reactions played out over social media channels to Ellison's testimony to see how it reflected how Americans were reacting to King's hearing on domestic terrorism.

Controversial Congressman Keith Ellison speaking at the Center for American Progress on March 2, 2011. Ellison was both the first African American to be elected to the House from the state of Minnesota and the first Muslim member of the U.S. Congress.

King's public denunciation of the Washington-based advocacy group, the Council on American-Islamic Relations (CAIR), reflected a concern first raised by conservative blogs during Ellison's initial campaign for Congress—namely, that CAIR is an organization linked by some government agencies to supporting terrorist organizations and whose members have donated to Ellison's campaign. Another member of the Minnesota congressional delegation, Michele Bachmann, has made public accusations against Huma Abedin, a Muslim woman who served as deputy chief of staff for former Secretary of State Hillary Clinton, of having ties to the Muslim Brotherhood. The Muslim Brotherhood organization is more familiar to most Americans as a result of Egypt's Mohamed Morsi, a member of the brotherhood, winning the presidency.

When bipartisan rejection of her claims followed, Bachmann leveled similar charges against Ellison. Taking to Glenn Beck's radio show, Bachmann alleged that Ellison had and continues to have associations with CAIR and with the Muslim Brotherhood. Bachmann and notable opposition blogs like *Power Line* profess that such associations invite suspicion and should entail official investigation into Ellison's allegiance to organizations linked to terrorism. Beck used his radio show as a platform to urge his listeners to remain vigilant in pursuing the evidence of Islamist infiltration of American governmental agencies. Such a move by Beck illustrates how traditional and social media forms collaborate to generate and circulate news stories. Social media news aggregators could take to Beck's exhortation as they had been the ones who initially broke the story of Ellison's problematic associations in 2006.

While the Abedin controversy abated quickly, amid a series of notable Republicans and a chorus of Democrats denouncing guilt-by-association allegations, the accusations persist against Ellison. Long critiqued by oppositional blogs, Ellison insists that the guilt-by-association tactics are unfounded and misleading. Just as Michele Bachmann prefers to speak almost exclusively with media outlets and blogs friendly to her position, so too does Ellison. It is noteworthy, for example, that in the wake of Bachmann's accusations against Ellison, he took to the *Huffington Post* to disavow any affiliation with the Muslim Brotherhood and to

suggest that Bachmann simply wanted attention and was reflecting ongoing efforts to marginalize religious minorities. Woodbury observes that, even in 2006, Ellison's campaign advisers were urging him to respond swiftly to misleading or false allegations made against him. Ellison historically has been reluctant to respond to allegations he believes to be false. Woodbury explains that, because Ellison does not view himself as racist or extremist, he does not always see a compelling reason to respond to those who allege otherwise. As is evidenced by his modest Twitter following and his preference for responding to blog-originated allegations to liberal-leaning blogs, Ellison does not readily target his detractors—or, perhaps more important, ask his followers to do the same—through oppositional tactics that social media make easy to employ.

In 2011, when Representative Anthony Weiner resigned from Congress after tweeting compromising pictures of himself to women who were not his wife—the aforementioned target of Michele Bachmann's proposed investigation, Huma Abedin—some in Congress thought Ellison, a fellow member of the Congressional Progressive Caucus, might be ready to assume Weiner's leadership position. Michael Shear notes, however, that Ellison lacks the charisma and brashness of Weiner, and perhaps more tellingly, the ability or willingness to utilize Twitter to mobilize progressives behind common issues.

In possible attempts at humor, Ellison has in 2012 retweeted a message calling the Republican presidential nominee a “heartless douchebag” and tweeted his amusement that a song by “coke-addicted” James Brown was played while Mitt Romney and his family said goodbye to the convention. In both instances, Ellison alleged that the tweet in question was a mistake made by a staffer. Regardless of his alleged Twitter command, Ellison is a much-discussed figure who, while not presently employing social media to the fullest extent to expand his sphere of influence, remains a controversial and ever-trending subject in the social media universe.
